Conclusion

Many problems afflict the Standard Model X

Theoretical

- Fine tuning
- Gauge unification

Experimental

- Dark Matter
- Neutrino mass
- From a theoretical point of view fine tuning is the main reason for physics beyond the Standard Model
- For naturalness reasons new physics is expected to be at the TeV scale

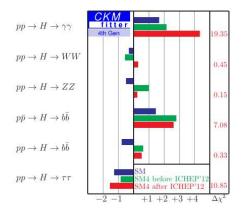

And with new physics, new particles appear...

A coloured new fermion is the most common new particle

▲ロト ▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶ ● 臣 ● のへで

Vector-Like Quarks (VLQs)

Many BSM models predict the existence of Vector-Like Quarks

- Colored Dirac fermions with 1/2 spin
- The right and left handed component of a VLQ transforms in the same way under the SM gauge group $SU(3)_c \otimes SU(2)_L \otimes U(1)_Y$

Conclusion

Vector-Like Quarks (VLQs)

They appear in many models of new physics

• Model of Composite Higgs

As excited resonances of bounds states that form the SM particles

• Warped or Universal **Extra Dimensions**

As KK excitations of bulk fields

• Little Higgs models

As partners of SM in large group representations that ensure cancellations of divergent loops

• Non minimal Supersymmetric models

They can increase corrections to Higgs mass

• Gauged **flavour** groups

Required to cancel anomalies in the gauged flavour symmetry

Conclusion

Properties of VLQs

The mixing parameters are constrained by many observables

- Flavour Changing Neutral Currents
- Meson's mixing and decays
- Rare top decays
- $Zc\bar{c}$ and $Zb\bar{b}$ couplings
- EW precision tests
- Higgs physics at the LHC

All these constraints are model dependent and have been studied Cacciapaglia et al., Heavy Vector-like Top Partners at the LHC and flavour constraints, 1108.6329 [hep-ph], Buchkremer et al., Model Independent Framework for Searches of Top Partners, 1305.4172 [hep-ph], Aguilar-Saavedra et al, A handbook of vector-like quarks: mixing and single production, 1306.0572 [hep-ph],...

Conclusion

Example

Suppose to have a b' decaying only into W^-t and W^-u : how many possible final state we have?

$$PP \rightarrow b'\bar{b}' \rightarrow \begin{cases} W^+W^-u\bar{u} \\ W^+W^-u\bar{t} \rightarrow W^+W^-W^-u\bar{b} \\ W^+W^-t\bar{u} \rightarrow W^+W^+W^-b\bar{u} \\ W^+W^-t\bar{t} \rightarrow W^+W^+W^-W^-b\bar{b} \end{cases}$$

ults Co

Example

Suppose to have a b' decaying only into W^-t and W^-u : how many possible final state we have?

$$PP \rightarrow b'\bar{b}' \rightarrow \begin{cases} W^+W^-u\bar{u} \\ W^+W^-u\bar{t} \rightarrow W^+W^-W^-u\bar{b} \\ W^+W^-t\bar{u} \rightarrow W^+W^+W^-b\bar{u} \\ W^+W^-t\bar{t} \rightarrow W^+W^+W^-W^-b\bar{b} \end{cases}$$

Distinguishing the channel through the W boson multiplicity the relative rates into WW, WWW and WWWW channels are given by

 $Br(b' \rightarrow Wu)^2 : 2Br(b' \rightarrow Wu)Br(b' \rightarrow Wt) : Br(b' \rightarrow Wt)^2$

s Conc

Example

Suppose to have a b' decaying only into W^-t and W^-u : how many possible final state we have?

$$PP \rightarrow b'\bar{b}' \rightarrow \begin{cases} W^+W^-u\bar{u} \\ W^+W^-u\bar{t} \rightarrow W^+W^-W^-u\bar{b} \\ W^+W^-t\bar{u} \rightarrow W^+W^+W^-b\bar{u} \\ W^+W^-t\bar{t} \rightarrow W^+W^+W^-W^-b\bar{b} \end{cases}$$

Distinguishing the channel through the W boson multiplicity the relative rates into WW, WWW and WWWW channels are given by

$$Br(b' \rightarrow Wu)^2 : 2Br(b' \rightarrow Wu)Br(b' \rightarrow Wt) : Br(b' \rightarrow Wt)^2$$

Each channel has a different selection efficiency for a given search However is enough to simulate the channels just once and calculate the total signal as a weighted sum of all channels with the saved efficiencies

Just one bin and integrated luminosity of 5 fb $^{-1}$

- $\sigma_{QCD}(m_{t'}) = 100 \text{ fb}$
- $Br(t' \rightarrow Wb) = 10\%$ $Br(t' \rightarrow Zt) = 90\%$
- $\epsilon(m_{t'}, WbW\bar{b}) = 1\%$ $\epsilon(m_{t'}, WbZ\bar{t}) = 2\%$ $\epsilon(m_{t'}, ZtW\bar{b}) = 3\%$ $\epsilon(m_{t'}, ZtZ\bar{t}) = 4\%$

- $\sigma_{QCD}(m_X) = 200 \text{ fb}$
- $Br(X \rightarrow Wt) = 100\%$
- $\epsilon(m_X, WtW\overline{t}) = 5\%$

$$N_{ev.} = \mathcal{L} \cdot \left(\sigma_{QCD}(m_{t'}) Br(t' \to Wb)^2 \epsilon(m_{t'}, WbW\bar{b}) + \sigma_{QCD}(m_{t'}) Br(t' \to Wb) Br(t' \to Zt) \epsilon(m_{t'}, WbZ\bar{t}) + \dots \right) = 68.5$$

The number of signal events has been easily computed knowing the efficiencies for each subprocess with given mass

Conclusion

Generation of the efficiencies database

Database of efficiencies

- Per VLQs pair: $t'\bar{t}', b'\bar{b}', X\bar{X}, Y\bar{Y}$
- Per decay channel: $t'\bar{t}' \rightarrow ZtZ\bar{t}, ZtZ\bar{u}, ..., b'\bar{b}' \rightarrow ZbZ\bar{b}, ZtZ\bar{d}, ...$
- Per search: CMS and ATLAS search
- Per mass: simulation at 100 GeV step in the 400-2000 GeV range
- Per chirality: L and R, VLQs couplings are mainly chiral

80 channels \cdot 2 chirality \cdot 17 mass = 2720 simulations

Knowing the efficiencies for all final state it is possible to reconstruct any signal Any scenario with any number of VLQ with general couplings can be analysed!!!

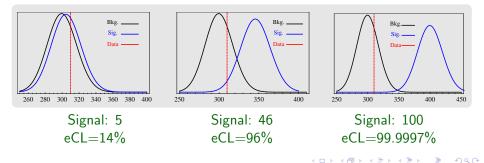

Computing the exclusion confidence level

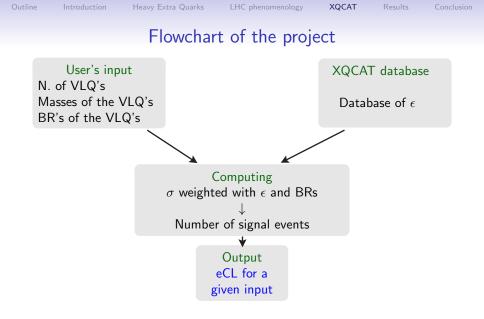

Suppose to have just one bin

Background: 300 events

Observation: 310 events

$$eCL = 1 - \frac{CL(s+b)}{CL(b)}$$

Exclusion confidence level for a give scenario without any simulation!!!

Search implemented in the tool

CMS searches

VLQs direct searches

B2G-12-015:
 t' → Wb, Zt, Ht 8 TeV

SUSY searches

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

- α_T : 7 and 8 TeV
- *L_p*: 7 TeV
- SS: 7 and 8 TeV
- *OS*: 7 TeV

No problem in considering non VLQs searches, since we are only interested in the final state signature!

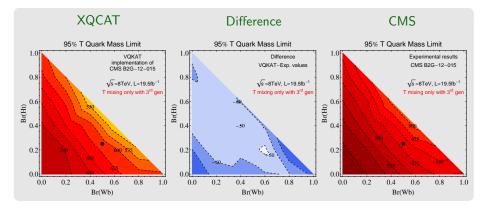

Results

Conclusion

Validation of the code

The code has been validated against the VLQ direct search B2G-12-015

A t' mixing only with W^+b , Zt and Ht decay channels

We reproduce the experimental results within 60 GeV

▲ロト ▲母 ▶ ▲目 ▶ ▲目 ▶ ● ○ ● ● ● ● ●

vy Extra Quarks

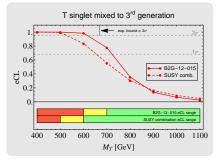

HC phenomenology

XQCAT

Results

Conclusion

$$t'$$
 singlet scenario
$$\begin{cases} Br(Zt) = 25\% \\ Br(Ht) = 25\% \\ BR(Wb) = 50\% \end{cases}$$
 Eq. theorem

- Direct search more sensitive
- SUSY searches bound not so far from the direct one

イロト 不得 トイヨト イヨト

э.

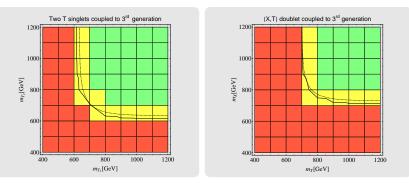

SUSY searches may have a role in scenarios where direct searches are not sensitive!!

Multiple VLQ scenario

Let's have a look at two toy multiple VLQ scenarios

 $(t'_1), (t'_2)$

(X, t')

- The presence of a second VLQ gives an higher mass bound
- The t' dedicate search is able to put a bound on the $X_{5/3}$ mass

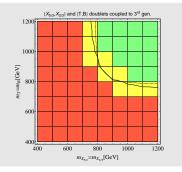

Conclusion

Multiple VLQ scenario

Considering physical motivated scenarios

Model with a Composite (pseudo) Goldstone boson Higgs De Simone et al., A First top partner hunter guide, arXiv:1211:5663 [hep-ph]

$$SO(4) \text{ bidoublet:} \begin{pmatrix} X_{5/3} & t' \\ X_{2/3} & b' \end{pmatrix} \begin{cases} Br(X_{5/3} \to Wb) = Br(B \to Wt) = 100\% \\ Br(X_{2/3} \to Zt) = Br(X_{2/3} \to Ht) = 50\% \\ Br(t' \to Zt) = Br(t' \to Ht) = 50\% \end{cases}$$

- The presence of extra quarks raises the bound on the VLQs masses to be in the 900-1000 GeV ballpark in the quasi degenerate case
- Model with extra content could be even more constrained

▲日 ▶ ▲周 ▶ ▲ ヨ ▶ ▲ ヨ ▶ ● ● ● ●

LHC phenomenolog

XQCAT

Results

Conclusion

Mixing with light generations of quarks

Back to the t' singlet case, assuming general couplings

 $Br(Z_i) = Br(Z_t) = 12.5\%$ $Br(Z_{j}) = 25\%$ $Br(H_i) = Br(H_t) = 12.5\%$ $Br(H_i) = 25\%$ $BR(W_j) = Br(W_b) = 25\%$ $BR(W_i) = 50\%$ T singlet mixed equally to 1st and 3rd gen. T singlet mixed to 1st generation 0.8 0.8 0.6 0.6 B2G-12-01 번 ^{0.4} 뒪 0.4 SUSY com SUSY comb 0.2 400 500 600 700 800 900 1000 1100 400500 600 700 800 900 1000 1100 MT [GeV] M_T [GeV]

In case of exclusive mixing with 1st generation, SUSY searches can give a bound, while direct searches no!

Multiple VLQ scenario

Considering again the Composite (pseudo) Goldstone boson Higgs model De Simone et al., A First top partner hunter guide, arXiv:1211:5663 [hep-ph] But now coupling exclusively to the 1st generation quarks

$$SO(4) \text{ bidoublet:} \begin{pmatrix} X_{5/3} & t' \\ X_{2/3} & b' \end{pmatrix} \begin{pmatrix} Br(X_{5/3} \to Wj) = Br(B \to Wj) = 100\% \\ Br(X_{2/3} \to Zj) = Br(X_{2/3} \to Hj) = 50\% \\ Br(t' \to Zj) = Br(t' \to Hj) = 50\% \end{pmatrix}$$

- These kind of models can already be constrained even if no dedicated searches are available
- Reinterpretation of SUSY searches provide indeed a powerful instrument

Other decay modes

We want to a conservative bound

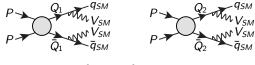

- A non exclusion doesn't mean that the scenario is allowed
- Possible other effect can increase the signal

Other decay modes

Adding new decay channels will only increase the final state signal An exclusion is therefore robust!

Conclusion

 $\sigma \propto |\mathcal{A}_1|^2 + |\mathcal{A}_2|^2 + 2 \textit{Re} \left[\mathcal{A}_1 \mathcal{A}_2^*\right]$

Within the NWA is it possible to estimate the interference effects knowing the couplings and the widths

$$\sigma'_{Q}(M_{i}) = \sigma_{Q}(M_{i})(1 + \sum_{j \neq i}^{n_{Q}} y_{ij}) \quad \text{with} \quad y_{ij} = \frac{2Re\left[g_{a}g_{b}^{*}g_{c}g_{d}^{*}(\int \mathcal{P}_{i}\mathcal{P}_{j}^{*})^{2}\right]}{g_{a}^{2}g_{b}^{2}(\int \mathcal{P}_{i}\mathcal{P}_{i}^{*})^{2} + g_{c}^{2}g_{d}^{2}(\int \mathcal{P}_{j}\mathcal{P}_{j}^{*})^{2}}$$

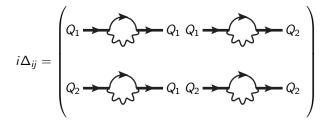

DB et al., Model independent approach for the analysis of interference effects in pair production of new heavy quarks, 1311.3977 [hep-ph]

イロト 不得 トイヨト イヨト

Conclusion

Quantum mixing between states

- With VLQ (quasi) degenerate in mass the off diagonal propagator effects might be relevant
- Need to diagonalize the matrix of the propagators

These effects are strongly model dependent
