

Fiducial Cut

Fiducial cut geometrically suppress 20 % of the event

350-500 GeV :

ESEV3 1D fit

Before cut : 825 protons 302 leptons

After cut : 661 protons 263 leptons

Finally in the blue region we have : 19,8 % protons and 12 % of electrons

Where is the missed electrons ?

-> Pollution by the protons ? No because we don't have more protons than expected

-> Migration in lower Bin ?

Fiducial Cut

Leptons in the border :

350-500 GeV : 12 %

15 GeV : 16 %

5 GeV : 17,5 %

3 GeV : 18,2 %

1 GeV : 22,7 %

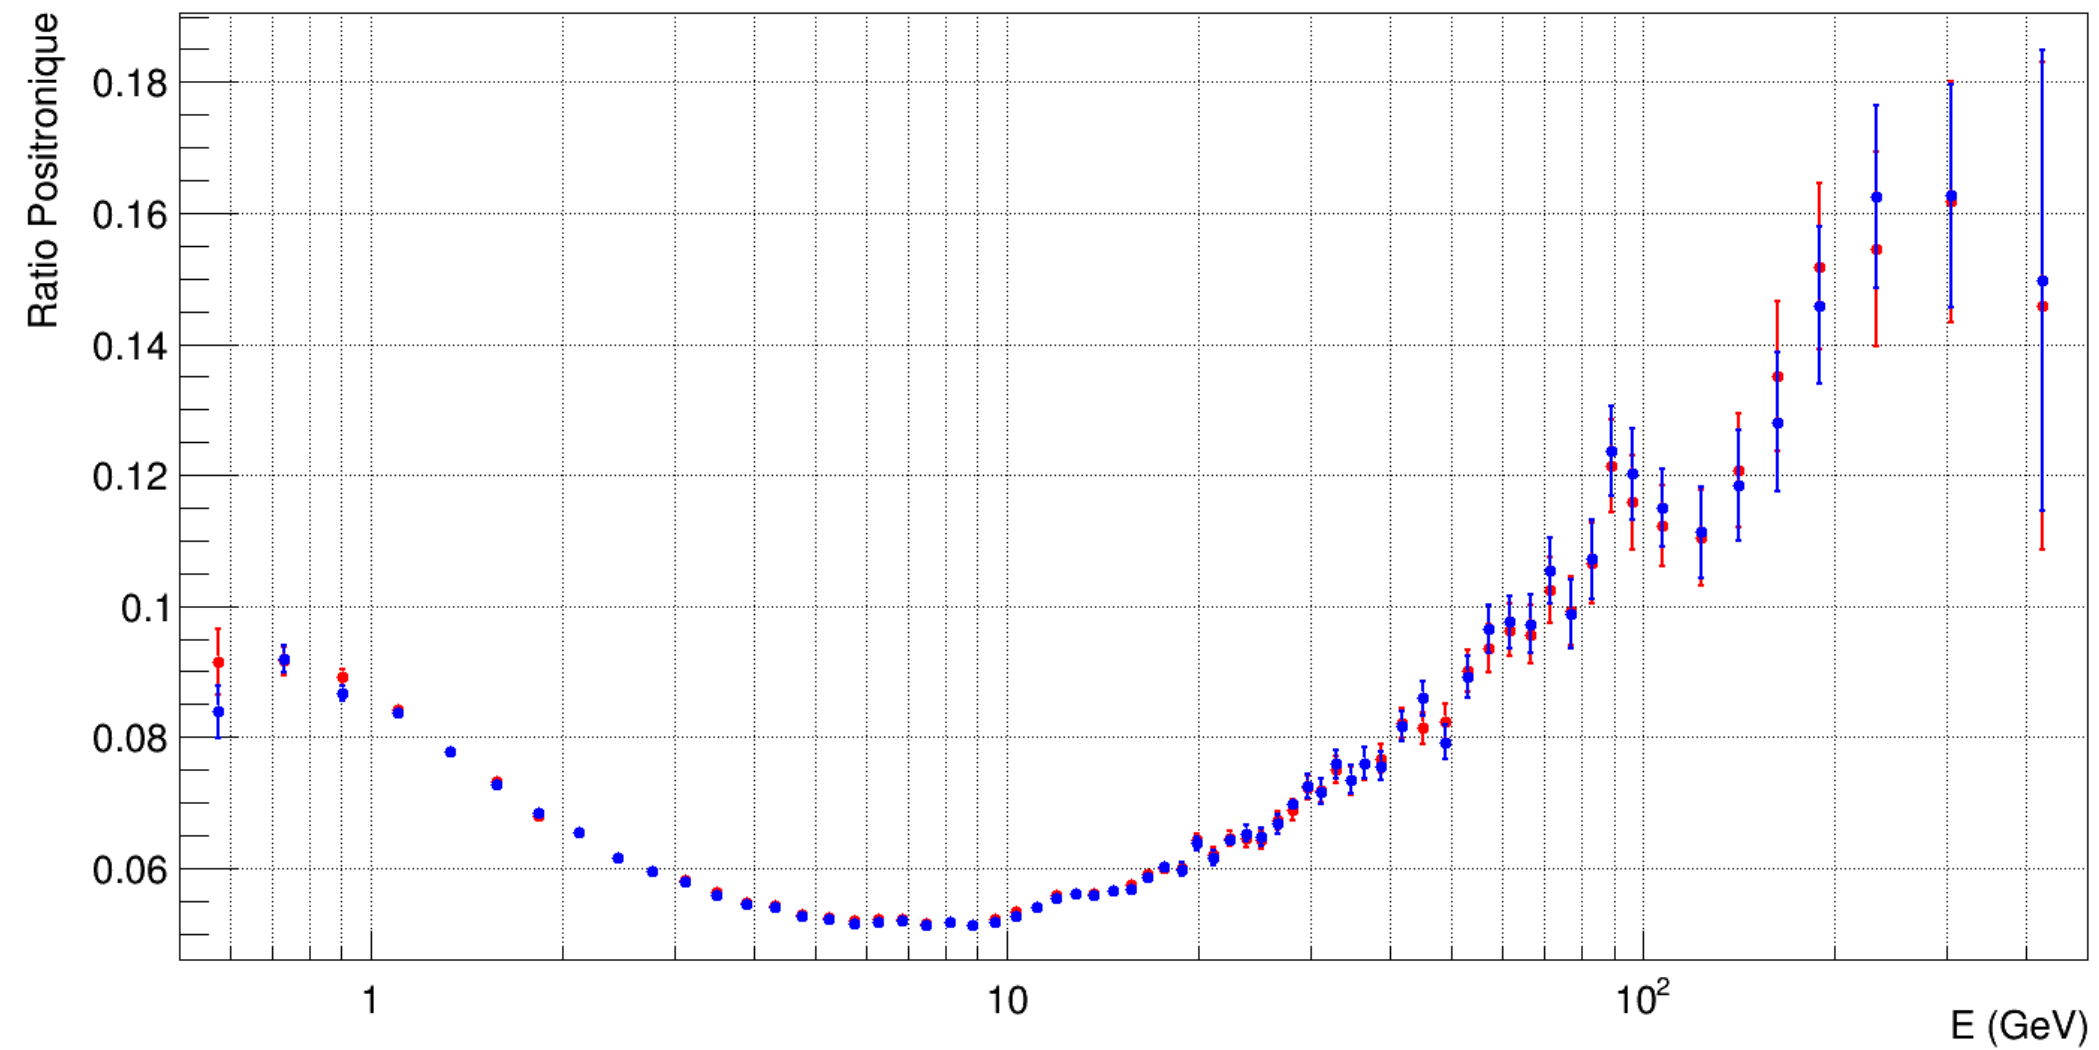

Seems to be Bin to Bin migration

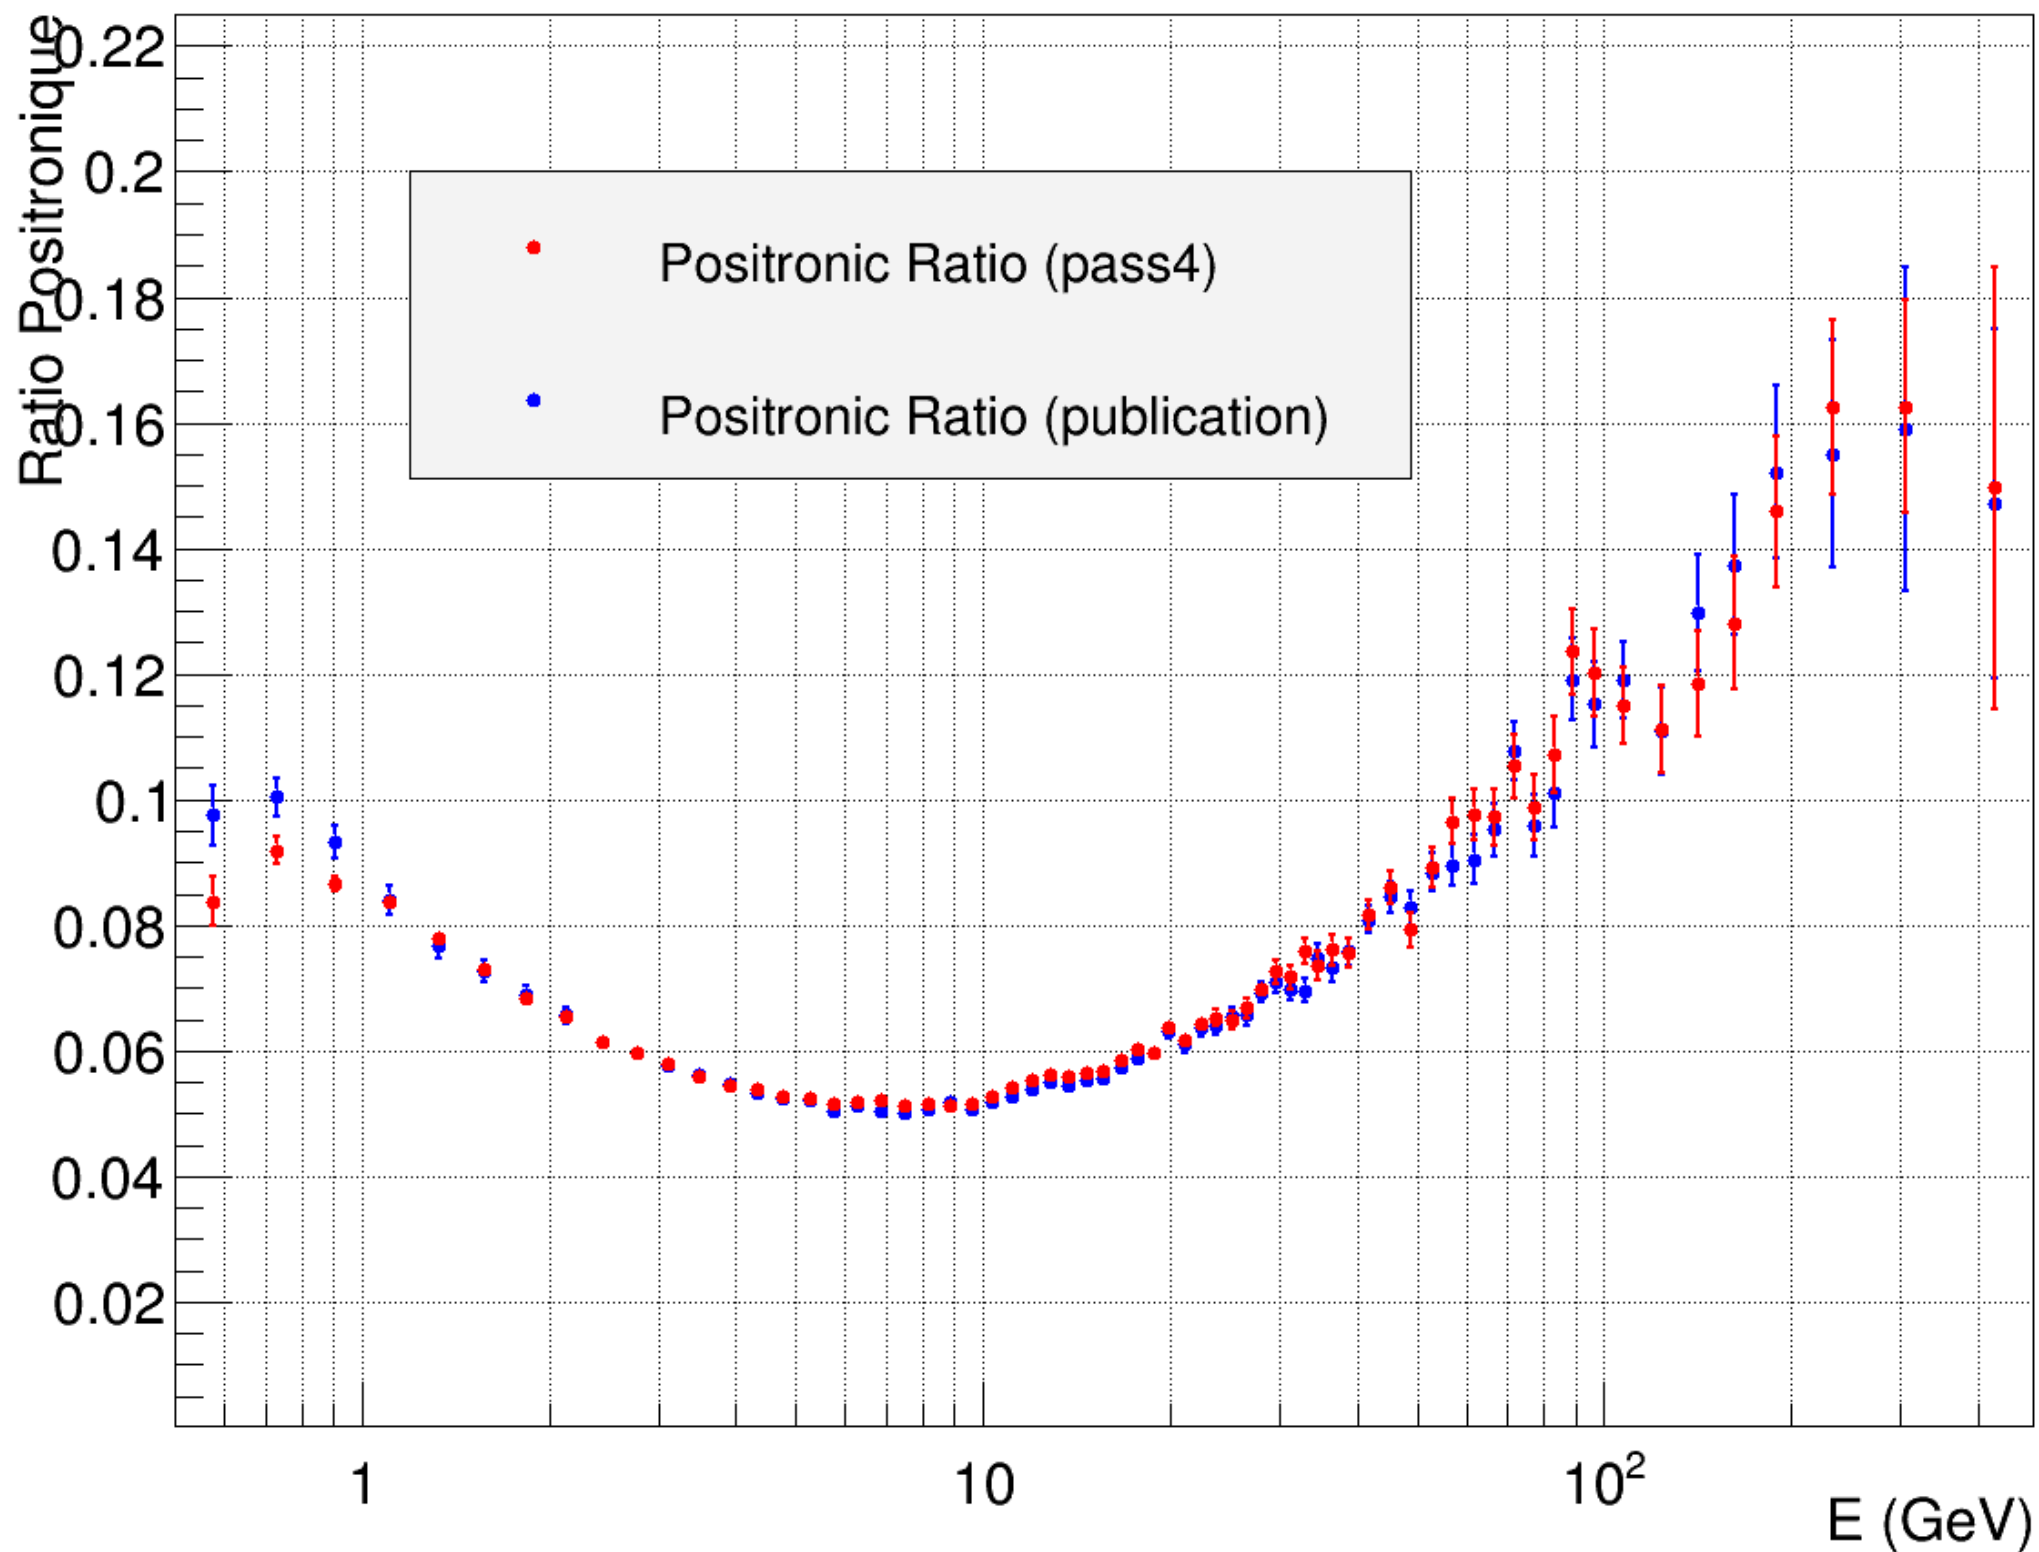

Fiducial Cut principally reduce Bin to bin migration

Ratio Positronique

Positronic Ratio on the border of calorimeter

Proportion Ne+Ana/Ne+AMS
