

W and DY cross sections with FEWZ 3.1

- Cross section table from wiki:
 - DY: 4 925 pb (LO)
 - W: 49 4972 pb (LO)
- FEWZ 3.1: Cross sections @ 13 TeV (with full acceptances: no minimum Pt requirements):
 - DY: 3 654 pb (LO)
 - W: 44 286 pb (LO)
- Lorenzo's calculations with FEWZ (version?) seemed to give reasonable results for LO
 - What am I doing wrong?
