## 2h production with isotriplet scalars

*jeudi 19 mars 2015 09:40 (15 minutes)*

The double SM-like  $h$ -boson production in the models with isospin-triplet scalars is studied. It is shown that in the see-saw type II model the mode with an intermediate heavy scalar,  $pp \rightarrow H + X \rightarrow 2h + X$ , may have the cross section which is comparable with that in the Standard Model. In the Georgi-Machacek model this cross section could be much larger than in SM since the vacuum expectation value of the triplet can be large.
