

# Probing the Universe with cosmological electromagnetic cascades

---

Thomas Fitoussi  
(PhD student - 1st year)

Supervisors and collaborators:

Renaud Belmont, Julien Malzac, Pierre Jean (IRAP)

Alexandre Marcowith, Johann Cohen Tanugi (LUPM)

- 1 Cosmological cascades
  - Cosmological cascades
  - Intergalactic Magnetic Field (IGMF)
  - Extragalactic light
- 2 Expected observables effects
  - Energy redistribution
  - Halo effect
  - Time delay
- 3 Thesis works
  - Monte Carlo simulation
  - Compare to analytic results
  - Future works
- 4 Conclusion

- Distant source of  $\gamma$ -rays (100GeV to 100TeV)
- Pairs production ( $e^-/e^+$ ) on EBL (IR  $\rightarrow$  UV)
- Inverse Compton scattering on CMB
- EGMF  $\Rightarrow$  lepton trajectory deflected

# Intergalactic Magnetic Field (IGMF)

## In galaxies

- Strong magnetic field ( $B \approx 10^{-5} \text{ G}$ )
- Generated by dynamo effect
- Required a seed to exist

## EGMF generation

- Created during the inflation
- Created during phase transition (QCD or electroweak decoupling)
- Associated to large structure development

Models predict  $B \approx 10^{-25}$  to  $10^{-9} \text{ G} !!$

Durrer & Neronov 2013

## 1 CMB

- Black body at  $T_0 = 2.725K$

## 2 EBL: light from star:

- $0.1 \rightarrow 1000\mu m$
- History of stellar formation
- Galactic evolution
- Depends on redshift

lepton trajectory deflected by EGMF  $\Rightarrow$

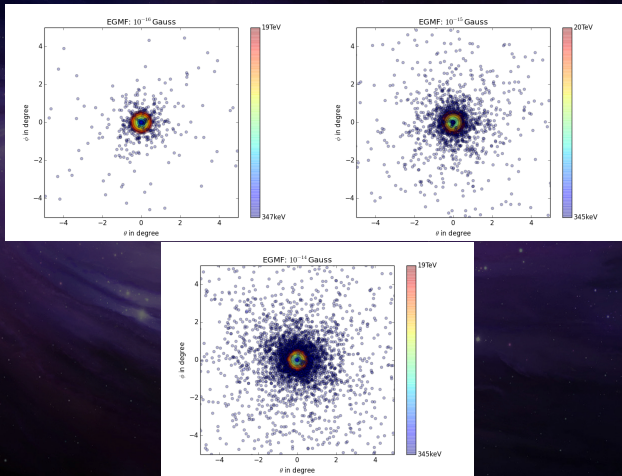

- Energy redistributed from TeV to GeV

Vovk et Al. (2012): Blazar 1ES 0229+200

lepton trajectory deflected by EGMF  $\Rightarrow$

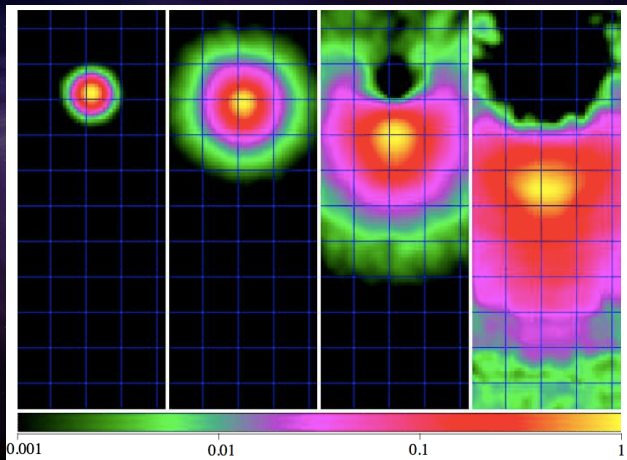

- Halo effects = size of the source extended

One direction and monokinetic jet ( $10^5 \text{ GeV}$ )

lepton trajectory deflected by EGMF  $\Rightarrow$

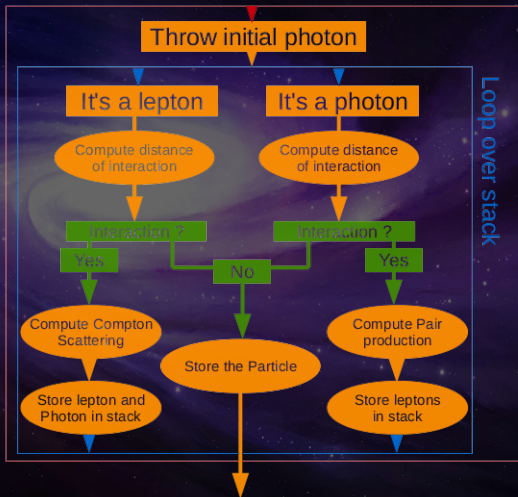

- Time delay in the arrival of the particles

$B \approx 10^{-16} G$  (Source: Neronov & al. 2010)

# Monte Carlo simulation

# Compare to analytic results

One direction and monokinetic jet ( $10^5$  GeV)

- Explore parameter space, make predictions for observables
- Compare with Fermi, and HESS data, predictions for CTA
- Model the capture, transport and annihilation of cascade positrons in our galaxy, compare with INTEGRAL 511 keV maps.

Cosmological cascades could improve our knowledge on

- Extragalactic magnetic field and its origin
- Spectrum and physics of  $\gamma$ -rays sources
- Extragalactic background light  
⇒ Evolution of galaxies
- Annihilation of galactic positrons
