

# ILD SiW ECAL Geometry

# Standard Geometry

- $R = 1843\text{mm}$
- 30 Si layers
- Cell Size = 5mm
- Si thickness = (0.5mm)

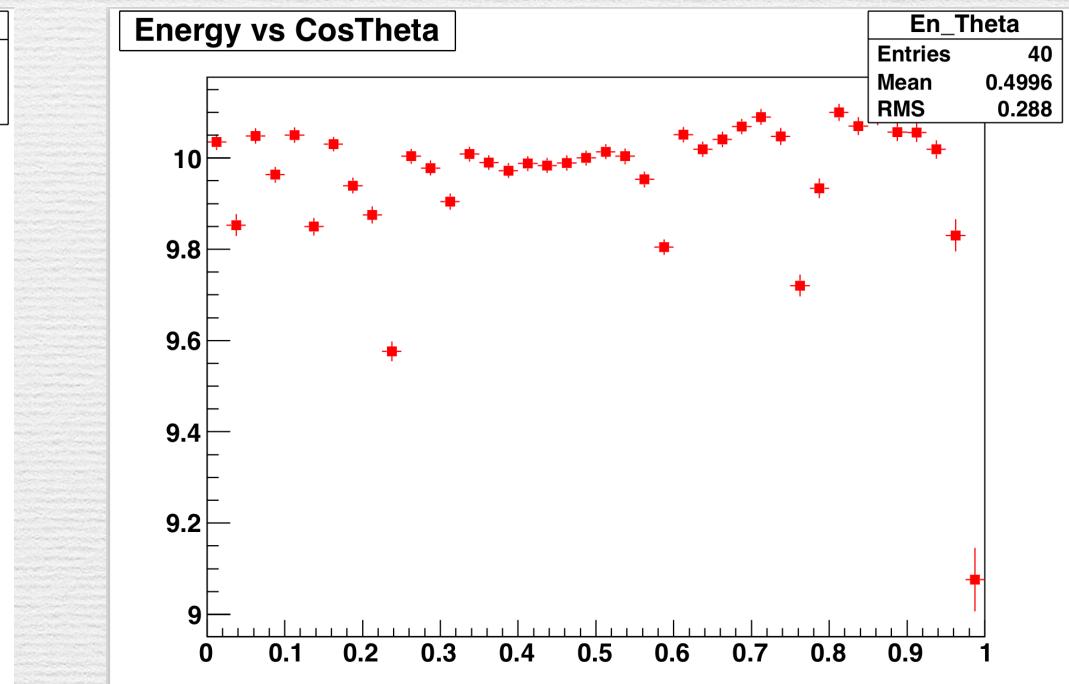

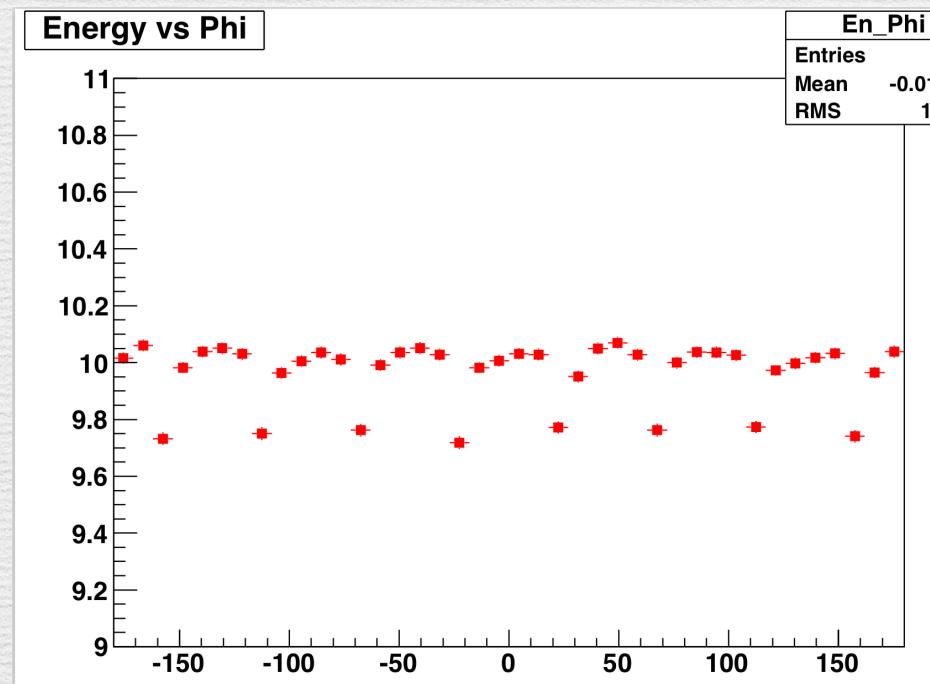

# Optimisation

- Aim: cost reduction
- Performance: energy resolution (JER)
- Parameters:
  - $R = 1843\text{mm} \longrightarrow R = 1450\text{mm}$
  - 30 Si layers  $\longrightarrow$  26 Si layers (20 Si layers)
  - Cellsize = 5mm  $\longrightarrow$  Cellsize = 2mm ??
  - Si thickness = 0.5mm  $\longrightarrow$  Si thickness = 0.7mm

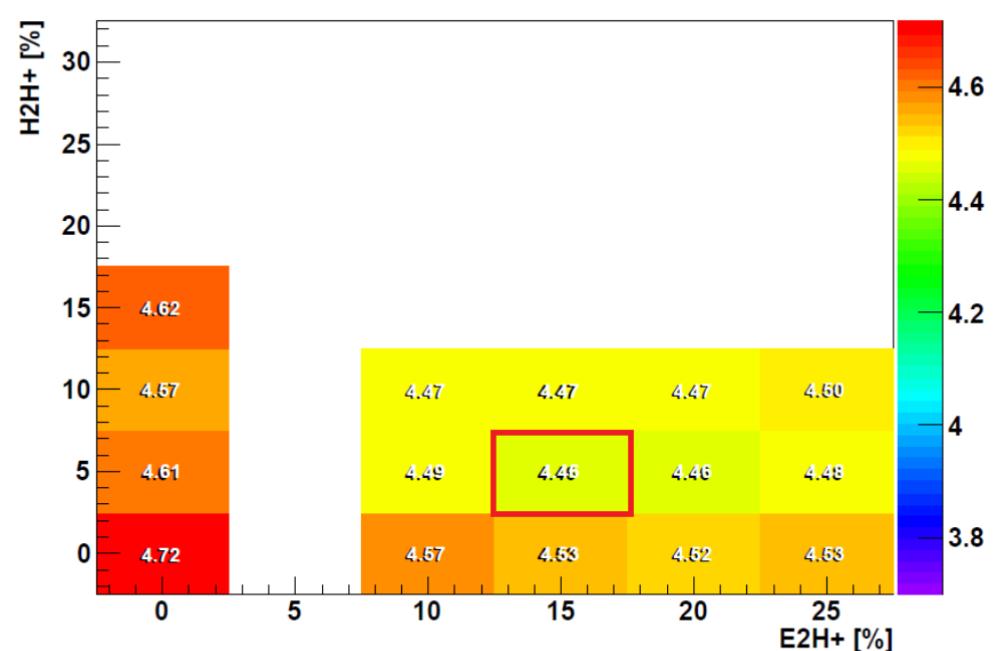

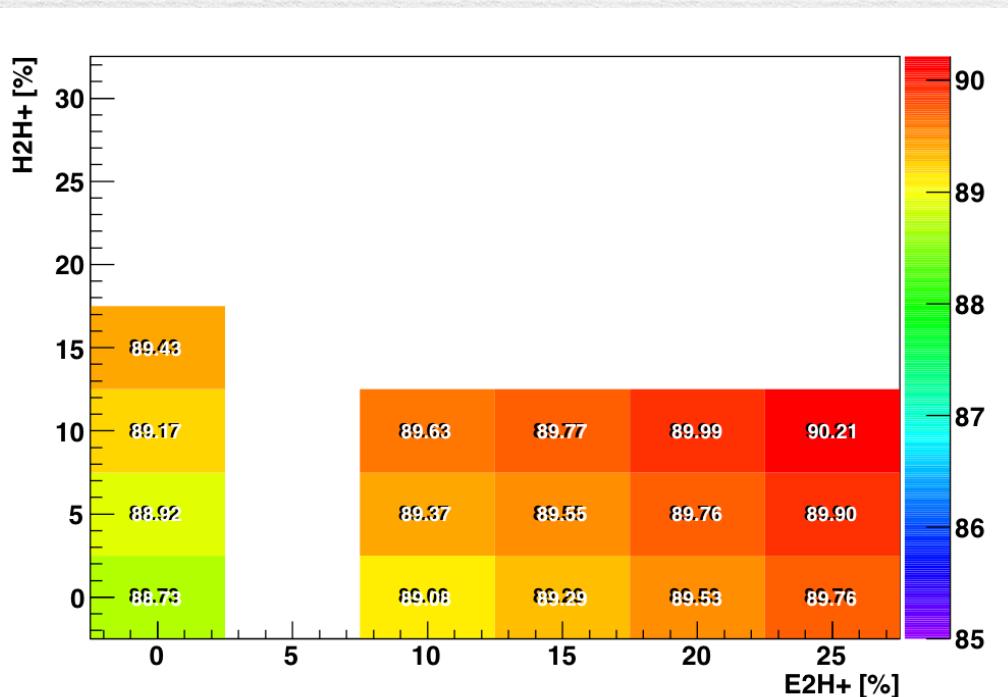

# Former works

- Geometry: ILD\_o2\_v06
- Reconstruction: PandoraPFA v00-09-02
- Events: 10000 uds events at 91GeV, 140GeV, 200GeV, 360GeV, 500 GeV
- JER: rms90
- Calibration: Sampling fraction + Angular correction (charged & neutral PFO) + hadronic shower (E2H & H2H)

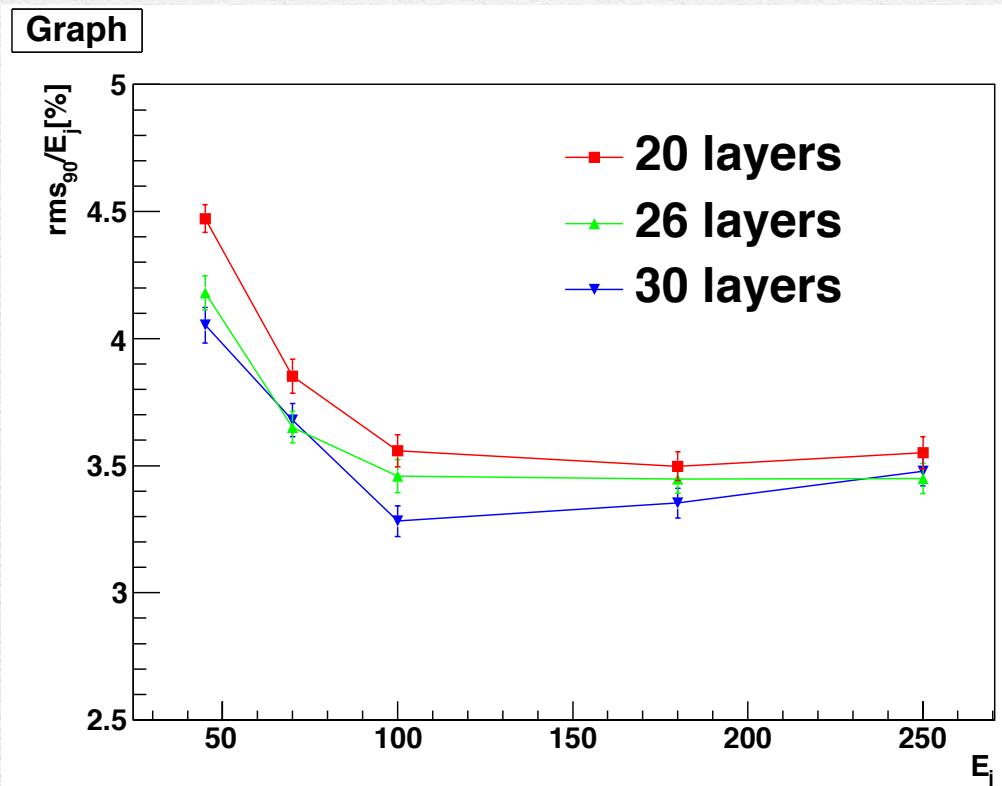

# Former works

- Calibration: Sampling fraction + Angular correction (charged & neutral PFO) + hadronic shower (E2H & H2H)

# Cellsize

From M. Thomson's presentation meeting 2014, Oshu

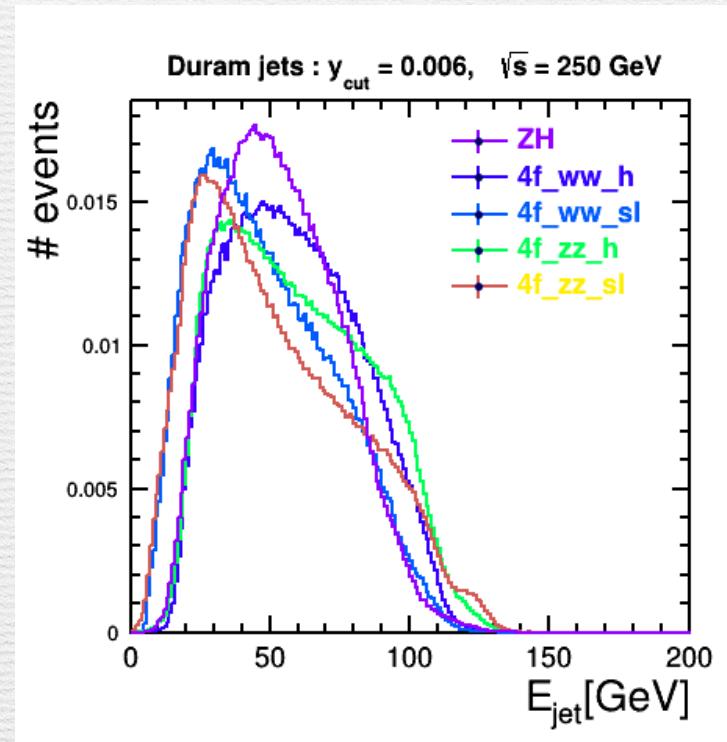

# JER thickness dependence

- Geometry: ILD\_o2\_v06
- Reconstruction: PandoraPFA v00-09-02
- Events: 10000 uds events at 91GeV, 140GeV, 200GeV, 360GeV, 500 GeV
- JER: rms90
- Calibration:

# Summary

- JER degradation for Si layers number: 10 % (45GeV)
- JER improvement for Si thickness: 8 %(45GeV)
- Q: A solution for both cost and performance?
