

# TOP-QUARK MASS MEASUREMENTS WITH ALTERNATIVE METHODS

TOP LHC-FRANCE 2015

Elvire Bouvier

Institut de Physique Nucléaire de Lyon

May 18, 2015

# Introduction

## “Classical” measurements:

directly inferring  $m_{\text{top}}$  from the top-quark decay products

- ▶ are dominated by systematic errors  
 $\hookrightarrow$  most of which are correlated across channels, methods, and experiments
- ▶ give the input MC top-quark mass parameter  
 $\hookrightarrow$  a properly defined short distance mass should enter the SM fits

## “Alternative” measurements:

measuring kinematic or dynamic variables correlated to  $m_{\text{top}}$

- ▶ measurements whose systematic uncertainties are as less as possible correlated to the latter ones
- or
- ▶ analyses explicitly sensitive to the top-quark pole mass

arXiv:1403.4427

Figure 1: Input measurements and result of the world combination. The overall uncertainty is dominated by *in situ* JES and systematic uncertainties.

# Outline

## Introduction

## Measuring the input MC top-quark mass parameter

- Using the  $m_{\ell b}$  variable

- Single-top enhanced topologies

- Using exclusive b decays

- B hadron lifetime technique

- Kinematic endpoint method

- Using the stransverse mass

## Measuring the top-quark pole mass

- From the  $t\bar{t}$  cross-section

- From the  $t\bar{t} + \text{jet}$  differential cross-section

## Conclusion

# Using the invariant mass of the 2 lepton plus b-jet pairs

arXiv:1503.05427

- Among  $\sqrt{s} = 7$  TeV data ( $4.7 \text{ fb}^{-1}$ ), selecting dileptonic  $t\bar{t}$  events ( $e^+e^-$ ,  $\mu^+\mu^-$ , and  $e^\pm\mu^\mp$ ) with  $\geq 2$  jets, of which exactly 2 are b-tagged
- For each event, computing  $m_{\ell b}$  for the 2 top-quarks, considering the jet assignment leading to the lowest average mass  
 $\hookrightarrow$  correct in 77% of the cases
- Performing a likelihood fit for Gaussian + Landau templates generated for 7 values of  $m_{\text{top}}^{\text{MC}}$  between 165 and 180  $\text{GeV}/c^2$

Figure 2: Fitted  $m_{\ell b}$  distribution in data. The inset shows the  $-2$  log likelihood profile as a function of the fitted top-quark mass.

$$m_{\text{top}} = 173.09 \pm 0.64 \text{ (stat.)} \pm 1.50 \text{ (syst.) GeV}/c^2$$

Main systematic sources:

JES, bJES, and b-tagging efficiency

# Using the invariant mass of a lepton plus b-jet pair

- Among  $\sqrt{s} = 8$  TeV data ( $19.7 \text{ fb}^{-1}$ ), selecting  $e^{\pm}\mu^{\mp}$  dileptonic  $t\bar{t}$  events with  $\geq 2$  jets, of which at least 1 is b-tagged
- For each event, computing  $m_{\ell b}$  for only 1 of the top-quarks: the b-jet of highest  $p_T$  is associated to one of the leptons, so that the lowest invariant mass is obtained  
 $\hookrightarrow$  correct in 85% of the cases
- Top-quark mass derived by comparison ( $\chi^2$  minimization) of the experimentally observed yields in individual bins of the  $m_{\ell b}$  distribution with the prediction for different values of  $m_{\text{top}}^{\text{MC}}$  between 166.5 and 178.5  $\text{GeV}/c^2$

CMS PAS TOP-14-014

Figure 3: Normalized event yields for  $t\bar{t}$  production, presented as a function of  $m_{\ell b}$ . The inset shows the  $\chi^2$  distribution as a function of the MC simulation parameter.

$$m_{\text{top}} = 172.3 \pm 1.3 \text{ GeV}/c^2$$

Main systematic sources:  
JES, bJES, and b-tagging efficiency

# Single-top enhanced topologies

- Among  $\sqrt{s} = 8$  TeV data ( $20.3 \text{ fb}^{-1}$ ), selecting single-top events with 1 lepton and 2 jets, of which 1 is b-tagged (t-channel)  
 $\hookrightarrow$  color reconnection and  $Q^2$  scale very different from the  $t\bar{t}$  decays
- Defining signal and control regions to train a 3-layer feed-forward neural network with a preprocessing of 12 input variables.  
 $\hookrightarrow$  a requirement on the neural-network based discriminant increases the proportion of t-channel events from 13% to 47%
- Performing a likelihood fit of the  $m_{\ell b}$  distribution for Gaussian + Landau templates generated for 7 values of  $m_{\text{top}}^{\text{MC}}$  between 165 and  $180 \text{ GeV}/c^2$

ATLAS CONF 2014-055

Figure 4: Fitted  $m_{\ell b}$  distribution in data with the normalization and  $m_{\text{top}}$  being the best fit values. The inset show the  $-2 \log$  likelihood profile as a function of the top-quark mass.

$$m_{\text{top}} = 172.2 \pm 0.7 \text{ (stat.)} \pm 2.0 \text{ (syst.) GeV}/c^2$$

Main systematic uncertainties:  
JES and hadronization

## Leptonic final states with $b \rightarrow J/\psi + X \rightarrow \mu^+ \mu^- + X$

- ▶ Using the correlation between the top-quark mass and the invariant mass of the  $J/\psi + \ell$  combination  $\rightarrow$  CERN/LHCC92-3 (1992) 90
- ▶ Systematic uncertainties mainly imputable to b-fragmentation, not impacted by jet-related sources or b-tagging
- ▶ Low branching ratio:  $BR(\bar{t}\bar{t} \rightarrow (W^+b)(W^-\bar{b}) \rightarrow (\bar{\ell} \nu_{\ell} J/\psi X)(qq'\bar{b})) \sim 0.55\%$   
Considering only  $J/\psi \rightarrow \mu^+ \mu^-$  and  $\ell \in \{e, \mu\}$ :  $BR \sim 2.1 \cdot 10^{-4}$   
 $\hookrightarrow$  1<sup>st</sup> time this method is tried, with 8 TeV data

Analysis in progress at LPNHE by F. Derue

Analysis in progress at IPNL

# Leptonic final states with $b \rightarrow J/\psi + X \rightarrow \mu^+ \mu^- + X$

- ▶ Selecting events with 1(2) isolated lepton(s) (e or  $\mu$ ), 1 opposite-sign di-muon pair whose invariant mass is around the  $J/\psi$  one, and satisfying a jet criterion, among  $\sqrt{s} = 8$  TeV data ( $19.8 \text{ fb}^{-1}$ )
- ▶ MC samples for calibration available since last week

Figure 5: Normalized differential production cross-section of  $J/\psi$  candidates in  $t\bar{t}$  events, as function of the relative  $p_T$  measured with respect to the jet axis direction.

Figure 6: Di-muon invariant mass after requiring 1 isolated lepton (e or  $\mu$ ), a di-muon pair, and a jet criterion.

- ▶ Studies on b-fragmentation also on-going to reduce systematic uncertainties

## B hadron lifetime technique ( $L_{xy}$ )

- ▶ Selecting  $t\bar{t}$  events among  $\sqrt{s} = 8$  TeV data ( $19.6 \text{ fb}^{-1}$ )
  - ▶ events with 1 charge isolated lepton (e or  $\mu$ ),  $\geq 4$  jets
  - ▶ events with 1 electron, 1 muon, and  $\geq 2$  jets
- ▶ Based on the fact that, in the rest frame of the top-quark, the top-quark decay products momenta are correlated to  $m_{\text{top}}$
- ▶ Considering the B-hadron decay length  $L_{xy}$  to be analogously correlated to  $m_{\text{top}}$  as most of the energy is transferred from the b-quark to the B-hadron

- ▶ Selecting the secondary vertex with the largest  $L_{xy}$  and the median  $\widehat{L}_{xy}$  of the distribution of secondary vertices with maximal  $L_{xy}$

- ▶ Exploiting the linear dependency of  $\widehat{L}_{xy}$  on the top-quark mass of  $O(0.0025 - 0.0030 \text{ cm})$  per  $\text{GeV}/c^2$

$$m_{\text{top}} = 173.5 \pm 1.5 \text{ (stat.)} \pm 1.3 \text{ (syst.)} \pm 2.6 (p_T(t)) \text{ GeV}/c^2$$

Main systematic uncertainties:  
background normalization,  
hadronization,  $p_T(t)$  modeling

CMS PAS TOP-12-030

Figure 7:  $\widehat{L}_{xy}$  as a function of  $m_{\text{top}}$  from simulation (left) and inclusive fit to the flavour content of a dijet sample based on the secondary vertex mass distribution (right).

# Kinematic endpoint method

- ▶ Selecting dileptonic  $t\bar{t}$  events among  $\sqrt{s} = 7$  TeV data ( $5.0 \text{ fb}^{-1}$ )
- ▶ Testing mass determination method that may be used in beyond SM physics scenarios  
 $\hookrightarrow$  topological resemblance: 2 cascade decays ending in invisible particles

- ▶ Underconstrained system  
 $\hookrightarrow \mu_{bb}$ : variable designed on purpose, weakly-correlated to the invariant mass  $M_{b\ell}$
- ▶  $\mu_{bb}^{\max}$  and  $M_{b\ell}^{\max}$  correlated to the top-quark mass
- ▶ Assuming  $m_\nu = 0$  and  $M_W = 80.4 \text{ GeV}/c^2$  in the joint unbinned likelihood fit procedure

- ▶ No MC calibration needed
- ▶ Main systematic uncertainties: fit range, JER

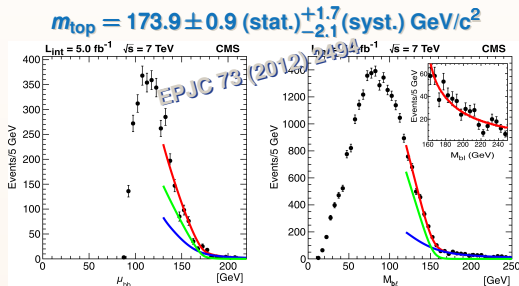

Figure 8: Simultaneous fit of the  $\mu_{bb}$  (left) and  $M_{b\ell}$  (right) distributions. The red line is the full fit, while the blue and green curves are for the background and signal shapes.

## Using the transverse mass

- Among  $\sqrt{s} = 7$  TeV data ( $4.7 \text{ fb}^{-1}$ ), selecting  $e^{\pm}\mu^{\mp}$  dileptonic  $t\bar{t}$  events with  $\geq 2$  jets
- Defining the transverse mass  $m_{T2}$ , a kinematic variable used in pair-production events where each parent particle decays into visible particles and one undetected particle (cf. [Phys. Rev. D81 \(2010\) 031102](#))  
 $\hookrightarrow \vec{p}_T^{\text{miss}}$  and 4-vectors of the 2 leptons and 2 b-jets are used,  $m_\nu$  is set to 0
- Using the dependence of the mean value  $\bar{m}_{T2}$  of the  $m_{T2}$  distribution on the top-quark mass  
 $\hookrightarrow$  MC samples with varied input  $m_{\text{top}}^{\text{MC}}$  are used to create a calibration curve

ATLAS CONF 2012-082

Figure 9: Calibration curve based on Monte Carlo simulation of  $t\bar{t}$  events at different input top-quark masses including all expected backgrounds.

$$m_{\text{top}} = 175.2 \pm 1.6 (\text{stat.})_{-2.8}^{+3.1} (\text{syst.}) \text{ GeV}/c^2$$

Main systematic sources:  
JES, bJES, generator model,  
and color reconnection

## From the $t\bar{t}$ cross-section

### Contribution from F. Déliot (IRFU)

- ▶ Using the measurement of  $\sigma_{t\bar{t}}$  derived at  $\sqrt{s} = 7$  TeV, through a multivariate analysis, from data collected in the  $e^{\pm}\mu^{\mp}$  dileptonic channel ( $35 \text{ pb}^{-1}$ )
- ▶ Theoretical predictions at approximate NNLO or NLO+NNLL, dependence on  $m_{\text{top}}^{\text{pole}}$  described by a 3<sup>rd</sup>-order polynomial divided by  $(m_{\text{top}}^{\text{pole}})^4$
- ▶ Using kinematical distributions from lepton and jet observables and information from b-tagging, feeding a profile likelihood

$$m_{\text{top}}^{\text{pole}} = 166.4_{-7.3}^{+7.8} \text{ GeV}/c^2$$

ATLAS CONF 2011-054

Figure 10: Comparison of the predicted cross-section and the experimentally measured cross-section as function of the top-quark mass.

## From the $t\bar{t}$ cross-section

- ▶ Using the measurement of  $\sigma_{t\bar{t}}$  derived at  $\sqrt{s} = 7$  TeV and  $\sqrt{s} = 8$  TeV from data collected in the  $e^{\pm}\mu^{\mp}$  dileptonic channel ( $4.6 \text{ fb}^{-1}$  and  $20.3 \text{ fb}^{-1}$ )
- ▶ Extraction performed by maximizing a Bayesian likelihood from the expected  $\sigma_{t\bar{t}}$ :
  - ▶ expected  $\sigma_{t\bar{t}}$  calculated to NNLO by the program TOP++ 2.0
  - ▶ soft-gluon resummation being performed at NNLL accuracy
  - ▶ dependence on  $m_{\text{top}}^{\text{pole}}$  described by a 2<sup>nd</sup>-order polynomial divided by  $(m_{\text{top}}^{\text{pole}})^4$

$$m_{\text{top}}^{\text{pole}} = 172.9^{+2.5}_{-2.6} \text{ GeV}/c^2$$

EPJC 74 (2014) 3109

Figure 11: Predicted NNLO+NNLL  $t\bar{t}$  production cross-section at 7 and 8 TeV as a function of the top-quark pole mass, using several PDF sets, compared to the cross-section measured by ATLAS assuming  $m_{\text{top}} = m_{\text{top}}^{\text{pole}}$ .

## From the $t\bar{t}$ cross-section

- ▶ Using the measurement of  $\sigma_{t\bar{t}}$  derived at  $\sqrt{s} = 7$  TeV from data collected in the dileptonic decay channel ( $2.3 \text{ fb}^{-1}$ )  
 $\rightarrow$  JHEP11 (2012) 067
- ▶ Constraining  $\alpha_s$  at the scale of the Z-boson mass to the current world average and assuming that the measured  $\sigma_{t\bar{t}}$  is not affected by non-SM physics
- ▶ Constructing a Bayesian prior from the expected  $\sigma_{t\bar{t}}$  :
  - ▶ expected  $\sigma_{t\bar{t}}$  calculated to NNLO by the program TOP++ 2.0
  - ▶ soft-gluon resummation performed at NNLL accuracy
  - ▶ dependence on  $m_{\text{top}}^{\text{pole}}$  described by a 3<sup>rd</sup>-order polynomial divided by  $(m_{\text{top}}^{\text{pole}})^4$

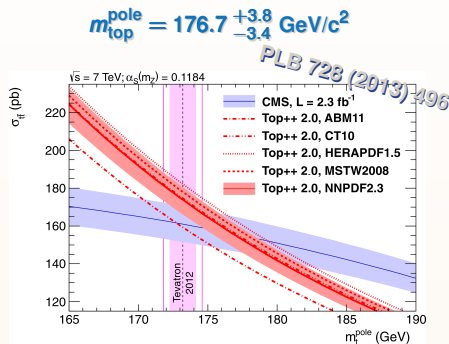

Figure 12: Predicted  $t\bar{t}$  cross-section at NNLO+NNLL as a function of the top-quark pole mass, using 5 different NNLO PDF sets, compared to the cross-section measured by CMS assuming  $m_{\text{top}} = m_{\text{top}}^{\text{pole}}$ .

# From the $t\bar{t}$ + jet differential cross-section

ATLAS CONF 2014-053

- ▶ Among  $\sqrt{s} = 7$  TeV data ( $4.6 \text{ fb}^{-1}$ ), selecting semileptonic  $t\bar{t}$  events with 1 lepton,  $\geq 2$  b-tagged jets,  $\geq 3$  other non b-tagged jets
- ▶ Based on the large dependence of gluon radiation on  $m_{\text{top}}$
- ▶ Measuring the differential cross-section of top-quark pair production in association with a high- $p_T$  jet:

$$\mathcal{R}(m_{\text{top}}^{\text{pole}}, \rho_s) = \frac{1}{\sigma_{t\bar{t}+\text{jet}}} \frac{d\sigma_{t\bar{t}+\text{jet}}}{d\rho_s}$$

$$\text{with } \rho_s = 2m_0/\sqrt{s_{t\bar{t}+\text{jet}}},$$

- ▶ Correcting for detector effects and hadronization after background subtraction
- ▶ Comparing to NLO+PS prediction using the least square method

Figure 13:  $\mathcal{R}$ -distribution at parton level corrected for detector and hadronization effects after the background subtraction.

$$m_{\text{top}}^{\text{pole}} = 173.7 \pm 1.5 \text{ (stat.)} \pm 1.4 \text{ (syst.)}_{-0.5}^{+1.0} \text{ (theo.) GeV}/c^2$$

Main systematic uncertainties:  
JES and ISR/FSR

## Conclusion and outlook

- ▶ Plenty more data to be taken in the next years:
  - ▶ Using  $5 \text{ fb}^{-1}$  of data at  $\sqrt{s} = 7 \text{ TeV}$  as a baseline for the projection
  - ▶ Assuming cross-section increase compensates trigger efficiency decrease
  - ▶ Assuming detector upgrade helps keeping PU under control
  - ▶ Assuming data constrain systematic sources
- ▶ NLO-multileg generators expected to provide a finer description
- ▶ b-JES, soft QCD, and more generally models expected to be better constrained by data

Figure 14: Projection of the top-quark-mass precision obtained with different measurement methods, for various integrated luminosity.

## Using the b-jet energy spectrum

- ▶ The  $E_b^{\text{lab}}$  distribution is peaking at:

$$E_b^{\text{rest}} = \frac{m_{\text{top}}^2 - m_W^2 + m_b^2}{2m_{\text{top}}}$$

robust wrt  $\sqrt{s}$ , top-quark boost, and ISR variations

- ▶ Generating pseudo-experiments for  $e^\pm \mu^\mp$   $t\bar{t}$  events at  $m_{\text{top}}^{\text{MC}} = 173 \text{ GeV}/c^2$ , assuming a luminosity of  $5 \text{ fb}^{-1}$  at  $\sqrt{s} = 7 \text{ TeV}$

- ▶ Fitting  $x = E_b^{\text{lab}}/E_b^{\text{rest}}$  with:

$$f(x) = K_1^{-1}(p) \exp \left[ -\frac{p}{2} \left( x + \frac{1}{x} \right) \right],$$

$p$  being a parameter and  $K_1(p)$  a modified Bessel function

- ▶ Purely kinematic method, needing precise detection of only one decay product

Phys.Rev. D88 (2013) 5, 057701

Figure 15: Fit of the energy distribution of the b-jets in a pseudo-experiment between 30 and 150 GeV.

For 100 pseudo-experiments, using the Delphes 1.9 detector simulation:  
 $\langle m_{\text{top}} \rangle = 173.1 \pm 2.5 \text{ GeV}/c^2$

# Bi-Event Subtraction Technique (BEST)

- ▶ testing mass determination method that may be used in beyond SM physics scenarios
- ▶ subtracting combinatorial background due to inclusion of particles which do not come from the cascade decay of interest
  - ↪ combining jet information from a different event several times for the same decay chain reconstruction
  - ▶  $m_{jj}^{\text{same}}$  dijet invariant mass distribution from one sample
  - ▶  $m_{jj}^{\text{bi}}$  dijet invariant mass distribution from a bi-event sample not coming from a W
  - ▶  $m_{jj}^{\text{BEST}} = m_{jj}^{\text{same}} - C_{jj}^{\text{BEST}} \cdot m_{jj}^{\text{bi}}$  showing a W-boson mass peak almost without combinatorial background

Figure 16: Dijet invariant mass distribution (left) and W+b invariant mass distribution (right) using BEST.

Phys. Lett. B 703:475 (2011)

# The top-quark mass in the Standard Model:

## How fundamental is this parameter ?

- ▶ key role in the prediction of many observables either directly or via electroweak radiative corrections  
 $\hookrightarrow BR(B_s \rightarrow \mu^+ \mu^-), m_W = f(m_{\text{top}}^2, \ln m_H)$
- ▶ key input to electroweak fit, which enables comparisons between experimental results and predictions within and beyond the SM
- ▶ highest Yukawa coupling to the Higgs boson: probe for the stability of the electroweak vacuum and Higgs boson properties

<http://cern.ch/Gfitter>

Figure 22: Contours of 68% and 95% confidence level obtained from scans of fits with fixed variable pairs  $M_W$  vs  $m_{\text{top}}$ . The narrower blue and larger grey allowed regions are the results of the fit including and excluding the  $M_H$  measurements respectively.
