

# HEAVY HADRON SPECTROSCOPY AT *LHCb*

Marco Pappagallo

University  
of Glasgow

LPNHE, Paris, 9 March 2015

# WHAT ABOUT ME?

## Education

➤ *Degree in Physics @ University of Bari*

Thesis: *Electroweak baryogenesis mediated by domain walls*

Cap. 5 Calcolo di AR con BBO

$$\delta_A^{new} = \frac{-2\epsilon_0^2(-1)^s g(-\alpha) + \epsilon_0^2(-1)^s \left[ \frac{\alpha'_s - \xi}{\alpha_s} \gamma_{+}(-\alpha_s, \alpha'_s) j + c' \gamma_{+}(\alpha_s, \alpha'_s) I'_s + C.C. \right]}{\epsilon^2 + \xi^2 - \alpha_s'^2} \quad (5.4.20)$$

$$\delta_A^{old} = \frac{-2\epsilon_0^2(-1)^s g(-\alpha) + \epsilon_0^2(-1)^s \left[ \frac{-\alpha'_s - \xi}{\alpha_s} \gamma_{+}(-\alpha_s, -\alpha'_s) + c' \gamma_{+}(\alpha_s, -\alpha'_s) I'_s + C.C. \right]}{\epsilon^2 + \xi^2 - \alpha_s'^2} \quad (5.4.21)$$

Nel caso di un domain wall i coefficienti di trasmissione e riflessione  $T^{(0)}$  e  $R^{(0)}$  sono:

$$T_{BB'}^{(0)} = T^{(0)} \left[ 1 + \sigma \frac{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 \delta_i^{new}}{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2} - \sigma \frac{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, \alpha'_s)|^2 \delta_i^{new}}{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, \alpha'_s)|^2} \right] \quad (5.4.22)$$

$$R_{BB'}^{(0)} = R^{(0)} \left[ 1 + \sigma \frac{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, -\alpha'_s)|^2 \delta_i^{old}}{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, -\alpha'_s)|^2} - \sigma \frac{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, \alpha'_s)|^2 \delta_i^{old}}{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, \alpha'_s)|^2} \right] \quad (5.4.23)$$

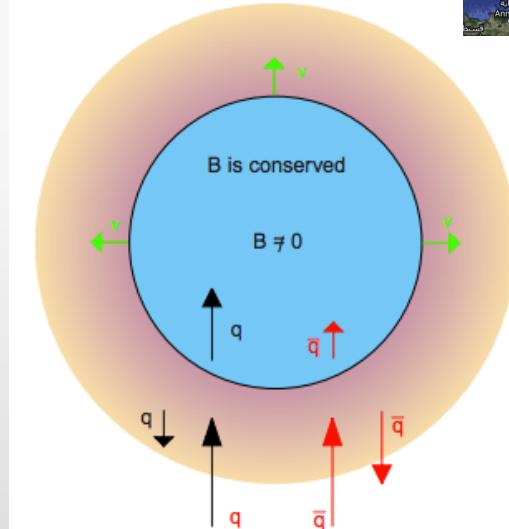

dove

$$T_{BB'}^{(0)} = \frac{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2}{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, \alpha'_s)|^2} \quad (5.4.24)$$

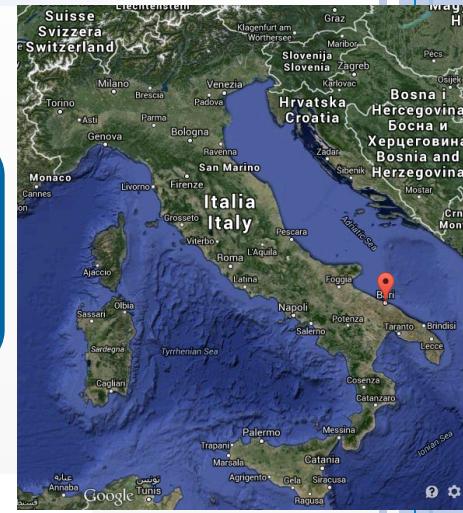

$$R_{BB'}^{(0)} = \frac{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, -\alpha'_s)|^2}{\sum_i \alpha_i |\mathcal{A}_i^{<0,s}|^2 |\gamma_{+}(\alpha_s, -\alpha'_s)|^2} \quad (5.4.25)$$

sono i coefficienti in assenza di perturbazione per cui vale ancora la relazione di unitarietà:

$$T_{BB'}^{(0)} + R_{BB'}^{(0)} = 1.$$

# OUTLINE

- The LHCb detector
- Introduction
- Excited Charmed Mesons
- Excited Beauty Mesons

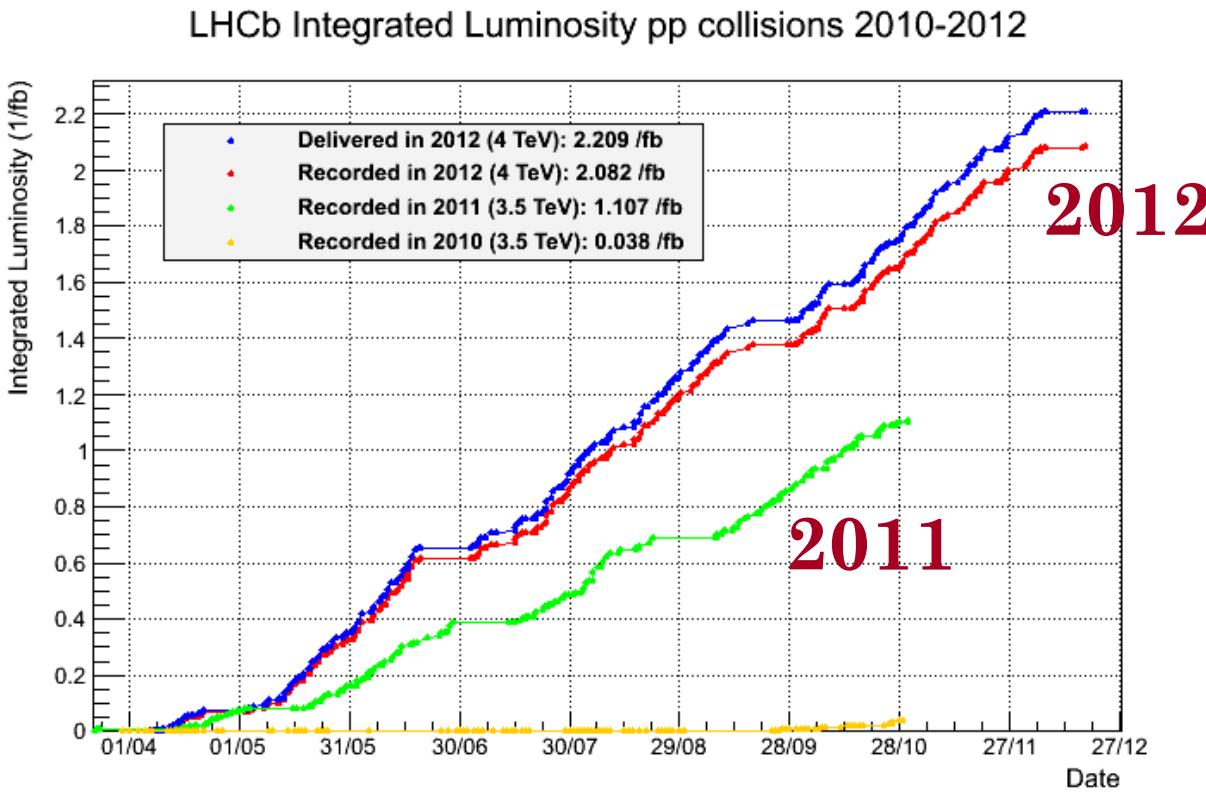

# THE LHCb DETECTOR

JINST 3 (2008) S08005

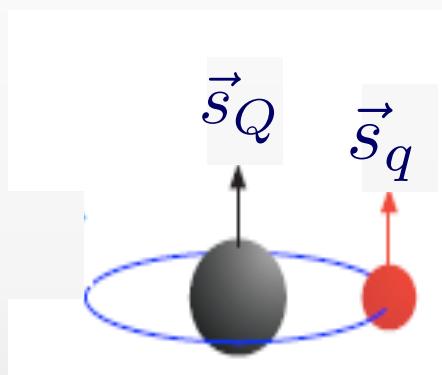

# DATASETS

LHCb collected 1.  $\text{fb}^{-1}$  at 7 TeV (2011) + 2.  $\text{fb}^{-1}$  at 8 TeV (2012)

# INTRODUCTION

- The heavy quark effective theories (HQET) predict the masses of the heavy mesons  $D_{(s)}$  and  $B_{(s)}$  by a perturbative expansion of  $\Lambda_{\text{QCD}}/m_Q \sim 0$
- Precise measurements of the excited heavy meson properties are a sensitive test of the validity of HQET

$$\vec{L}$$

$$\vec{j}_q = \vec{L} + \vec{s}_{q=u,d,s}$$

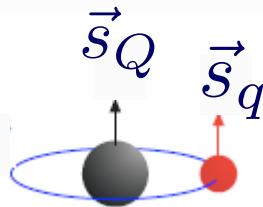

$$\vec{J} = \vec{j}_q + \vec{s}_{Q=b,c}$$

Orbital angular momentum

Angular momentum of the light quark

Total angular momentum of the heavy meson

# INTRODUCTION

$$\vec{L} = \vec{j}_q + \vec{s}_{Q=b,c}$$
$$\vec{j}_q = \vec{L} + \vec{s}_{q=u,d,s}$$

Orbital angular momentum

Angular momentum of the light quark

Total angular momentum of the heavy meson

$$\text{Parity } P = (-1)^{L+1}$$

Intrinsic parity of  $q\bar{q}$

$$J^P = 0^+, 1^-, 2^+, 3^- \dots, (-1)^J$$

$$J^P = 0^-, 1^+, 2^-, 3^+ \dots, (-1)^{J+1}$$

# NOMENCLATURE

## Spectroscopy notation

Radial quantum number

$$n^{2S+1}L_J$$

Sum of quark spins

$L = 0, 1, 2, \dots \rightarrow S, P, D$

## PDG notation

Natural spin-parity

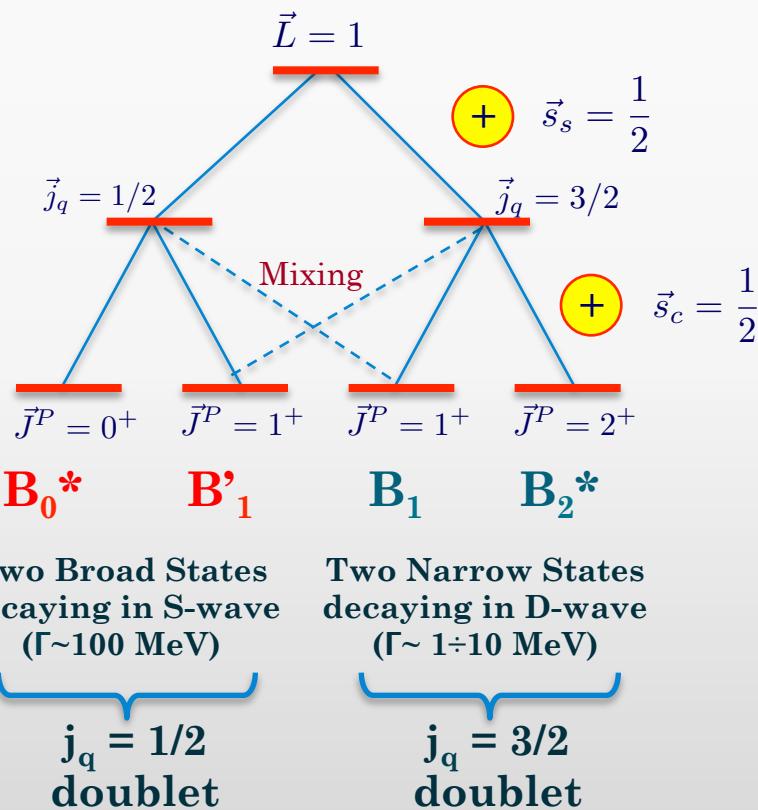

$$D^*_J(m)^{0/\pm} \text{ or } B^*_J(m)^{0/\pm}$$

Mass

# EXCITED HEAVY MESONS

For  $L>0$ , there are four different possible  $(J, j_q)$  combinations

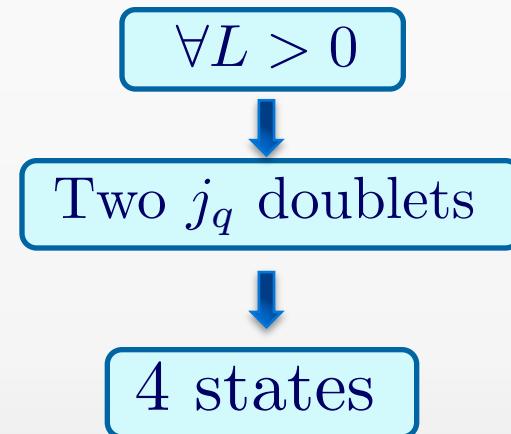

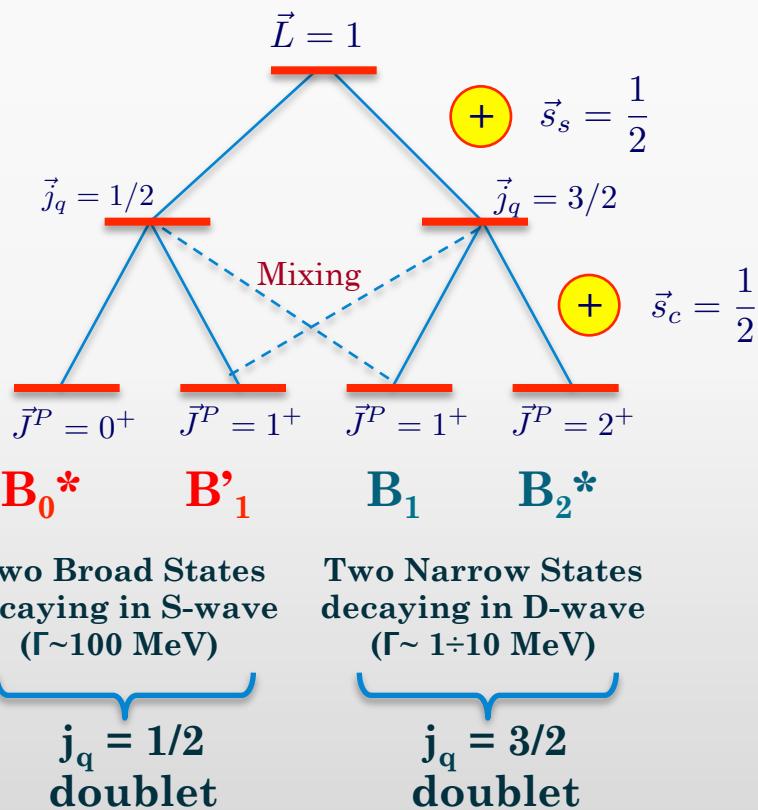

E.g. Orbitally  $L=1$  excited  $B^{**} \rightarrow B^{(*)}\pi$

# EXCITED HEAVY MESONS

For  $L>0$ , there are four different possible  $(J, j_q)$  combinations

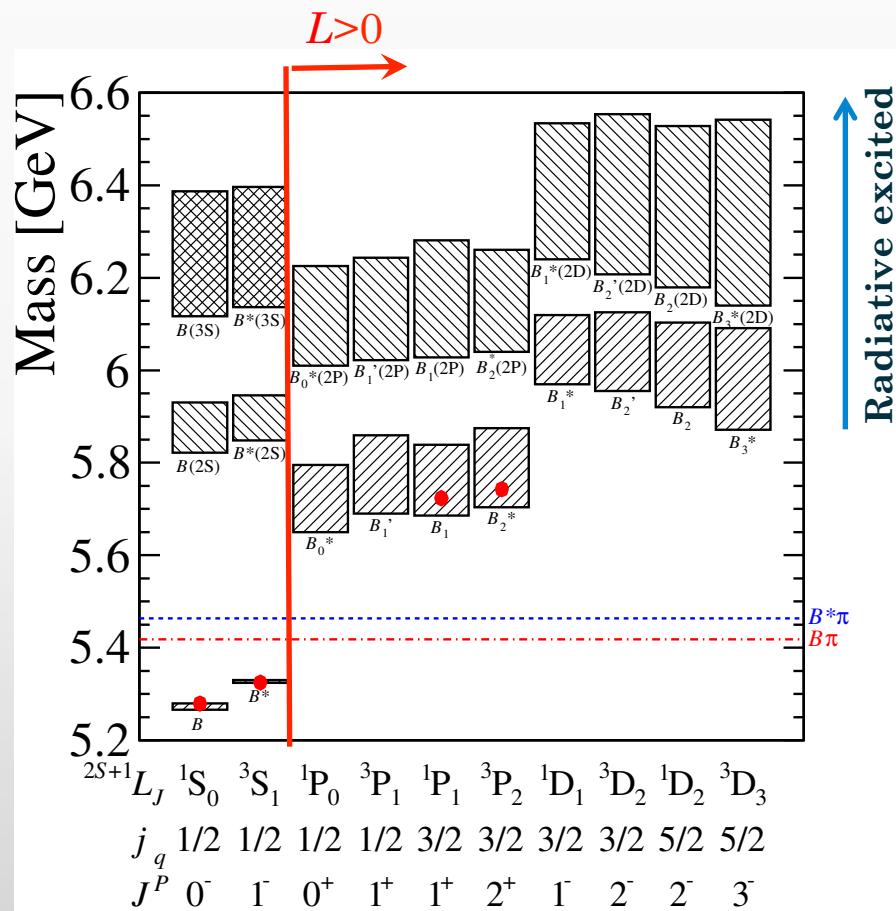

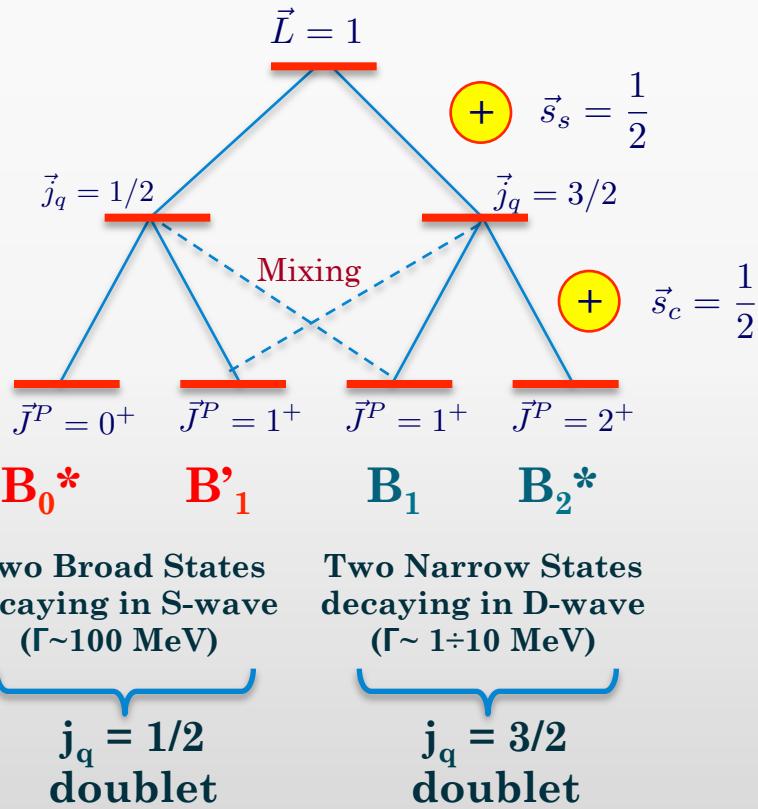

E.g. Orbitally  $L=1$  excited  $B^{**} \rightarrow B^{(*)}\pi$

# EXCITED HEAVY MESONS

For  $L>0$ , there are four different possible  $(J, j_q)$  combinations

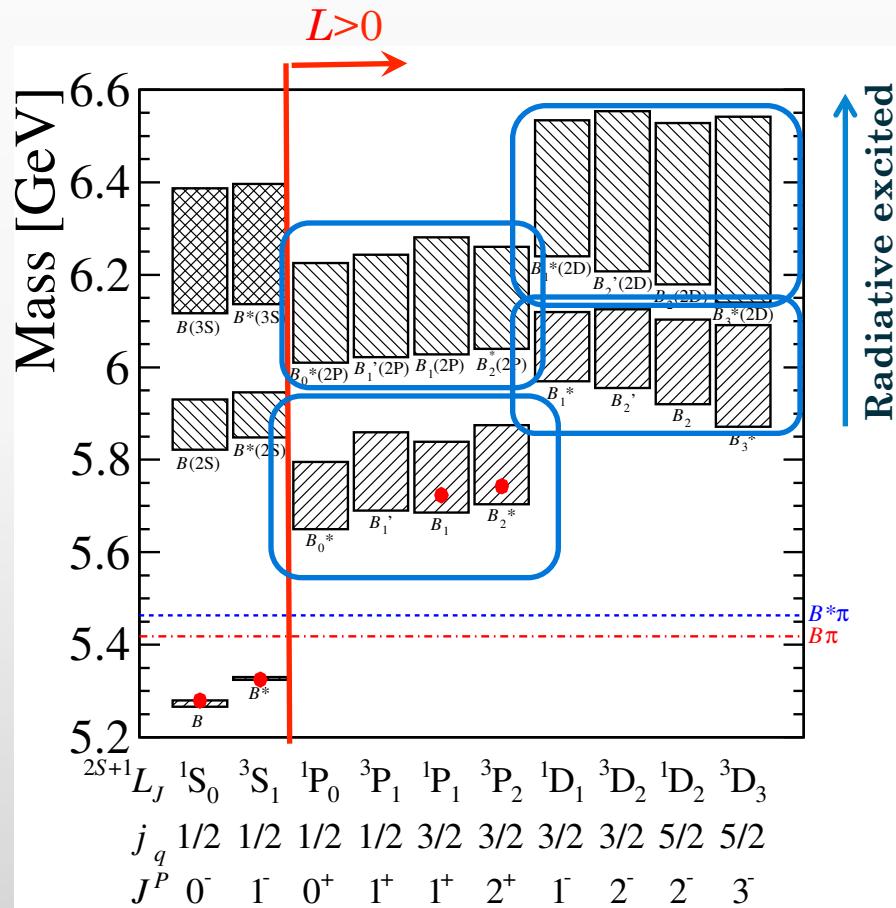

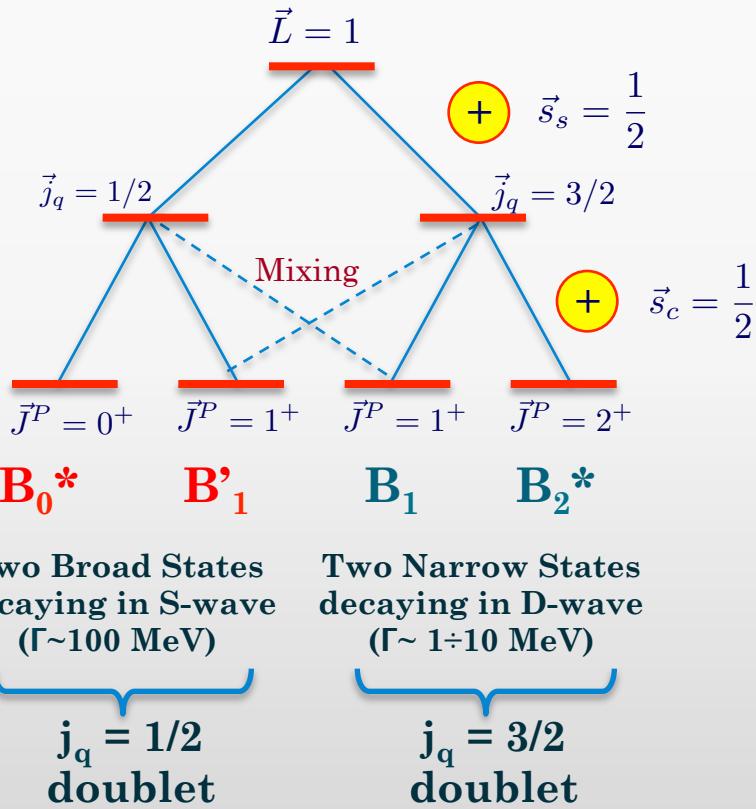

E.g. Orbitally  $L=1$  excited  $B^{**} \rightarrow B^{(*)}\pi$

# EXCITED HEAVY MESONS

For  $L>0$ , there are four different possible  $(J, j_q)$  combinations

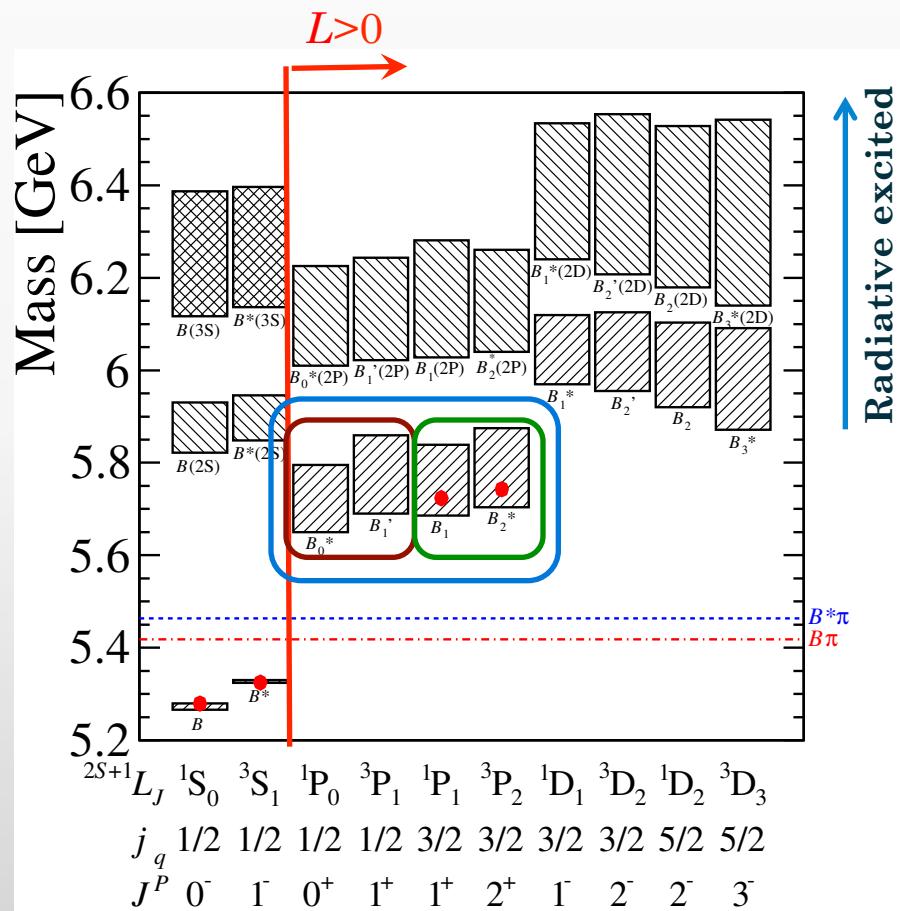

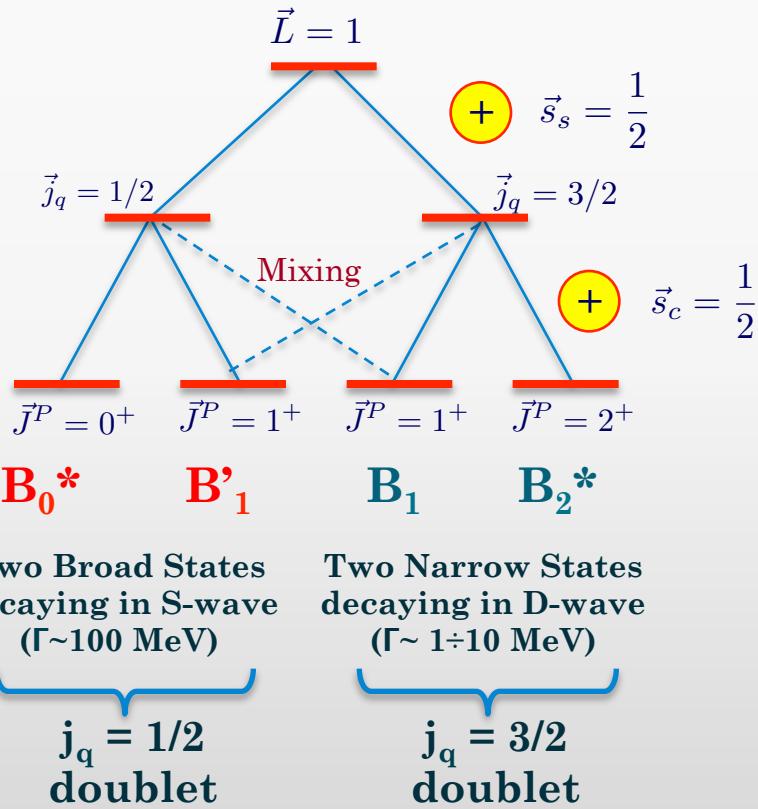

E.g. Orbitally  $L=1$  excited  $B^{**} \rightarrow B^{(*)}\pi$

# EXCITED HEAVY MESONS

For  $L>0$ , there are four different possible  $(J, j_q)$  combinations

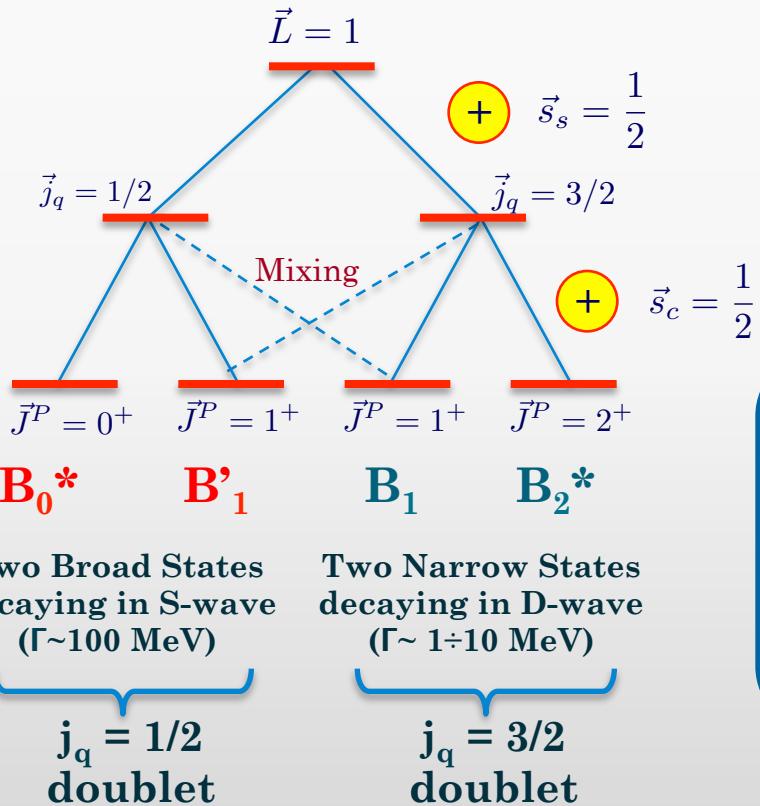

E.g. Orbitally  $L=1$  excited  $B^{**} \rightarrow B^{(*)}\pi$

# DECAYS OF EXCITED HEAVY MESONS

For  $L>0$ , there are four different possible  $(J, j_q)$  combinations

E.g. Orbitally  $L=1$  excited  $B^{**} \rightarrow B^{(*)}\pi$

	$j_q$	$J^P$	Allowed decay mode	
			$B\pi$	$B^*\pi$
$B_0^*$	1/2	0 <sup>+</sup>	yes	no
$B'_1$	1/2	1 <sup>+</sup>	no	yes
$B_1$	3/2	1 <sup>+</sup>	no	yes
$B_2^*$	3/2	2 <sup>+</sup>	yes	yes

The four states come in doublets and within each doublet :

- ✓ 1 natural state ( $B_2^*$ ) decaying to  $B\pi$  and  $B^*\pi$
- ✓ 1 unnatural state ( $B_1$ ) decaying to  $B^*\pi$

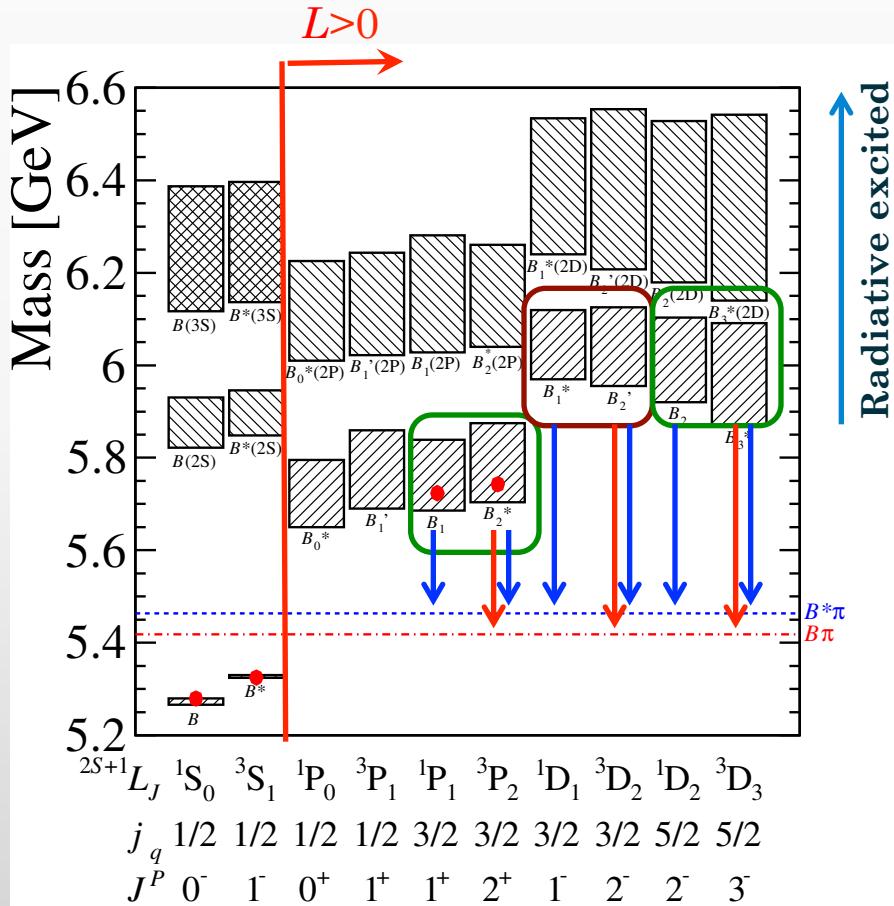

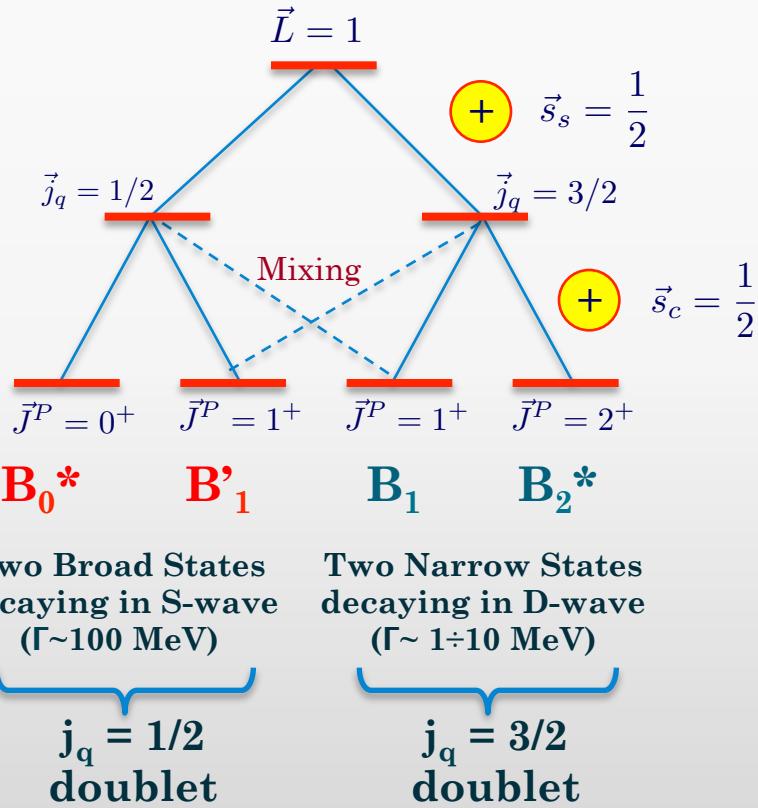

(Only exception is the  $(0^+, 1^+)$  doublet above)

Similar scenario for the excited  $B_s^{**} \rightarrow B^{(*)}K$ ,  $D^{**} \rightarrow D^{(*)}\pi$ ,  $D_s^{**} \rightarrow D^{(*)}K$

# DECAYS OF EXCITED HEAVY MESONS

For  $L>0$ , there are four different possible  $(J, j_q)$  combinations

E.g. Orbitally  $L=1$  excited  $B^{**} \rightarrow B^{(*)}\pi$

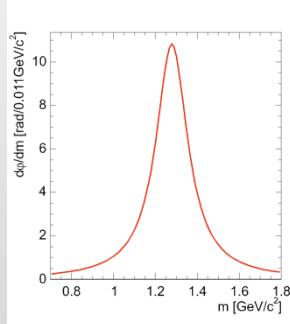

# HOW TO DO SPECTROSCOPY?

## “Inclusive Analysis”

(e.g.  $e^+e^- \rightarrow D^{**}(\rightarrow D\pi) + X$  or  $pp \rightarrow B_s^{**}(\rightarrow BK) + X$ )

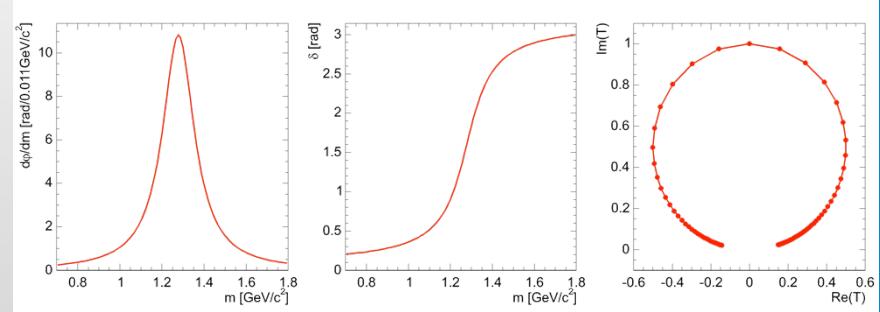

- Large cross sections 😊
- Large combinatorial background 😞
- Resonances appear as bumps
- Hard to disentangle broad structures
- Difficult to assess spin due to the unknown initial polarization 😰

## “Exclusive Analyses”

(e.g.  $B \rightarrow D^{**}(\rightarrow D\pi)\pi$  or  $B_c \rightarrow B_s^{**}(\rightarrow BK)\pi$ )

- Limited statistics 😞
- Small background 😊
- Resonance characterized by amplitude (i.e. bump) AND phase (i.e. interference) 😊
- Suitable to study broad resonances
- Spin-parity assignment by amplitude analysis 😰

# DOUBLETS IN EXCLUSIVE ANALYSES

## Exclusive analysis

$$B^- \rightarrow D^{(*)+} \pi^- \pi^-$$

[Belle: Phys.Rev.D69 (2004) 112002]

(e.g) L=1,  $j_q=3/2$  doublet

- 1 peak in  $D\pi$
- 2 peaks in  $D^*\pi$

$j_q$	$J^P$	Allowed decay mode	
		$D\pi$	$D^*\pi$
$D_0^*$	$1/2$	$0^+$	yes      no
$D_1'$	$1/2$	$1^+$	no      yes
$D_1$	$3/2$	$1^+$	no      yes
$D_2^*$	$3/2$	$2^+$	yes      yes

# DOUBLETS IN EXCLUSIVE ANALYSES

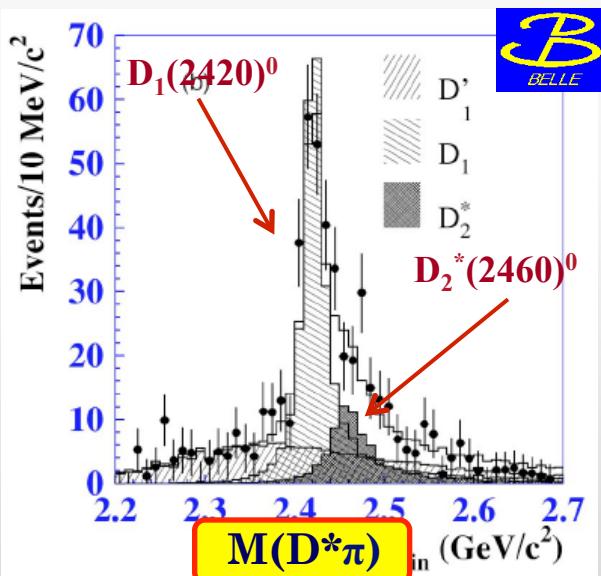

## Exclusive analysis

$$B^- \rightarrow D^{(*)+} \pi^- \pi^-$$

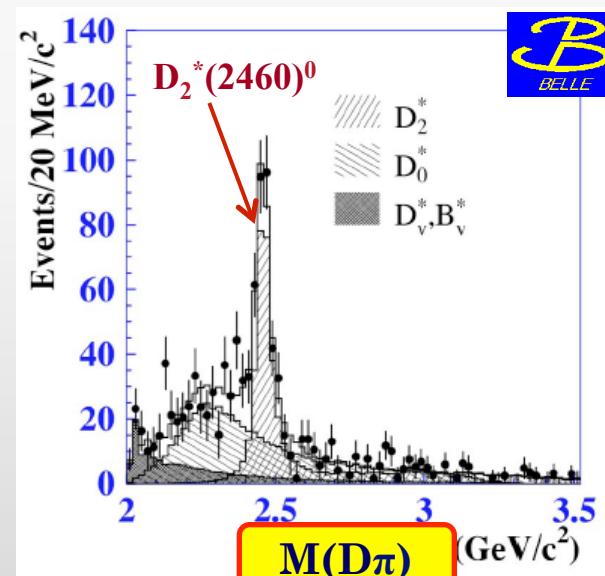

[Belle: Phys.Rev.D69 (2004) 112002]

(e.g)  $L=1, j_q=3/2$  doublet

- 1 peak in  $D\pi$
- 2 peaks in  $D^*\pi$  } as expected

$j_q$	$J^P$	Allowed decay mode	
		$D\pi$	$D^*\pi$
$D_0^*$	$1/2$	$0^+$	yes no
$D_1'$	$1/2$	$1^+$	no yes
$D_1$	$3/2$	$1^+$	no yes
$D_2^*$	$3/2$	$2^+$	yes yes

Broad states of the  $j=1/2$  doublets also revolved by an amplitude analysis

# DOUBLETS IN INCLUSIVE ANALYSES

## Inclusive analysis

$$pp \rightarrow D^{(*)+} \pi^- + X$$

[LHCb: JHEP 09 (2013) 145]

(e.g) L=1,  $j_q=3/2$  doublet

- 1 peak in  $D\pi$
- 2 peaks in  $D^*\pi$

$j_q$	$J^P$	Allowed decay mode	
		$D\pi$	$D^*\pi$
$D_0^*$	$1/2$	$0^+$	yes      no
$D_1'$	$1/2$	$1^+$	no      yes
$D_1$	$3/2$	$1^+$	no      yes
$D_2^*$	$3/2$	$2^+$	yes      yes

# DOUBLETS IN INCLUSIVE ANALYSES

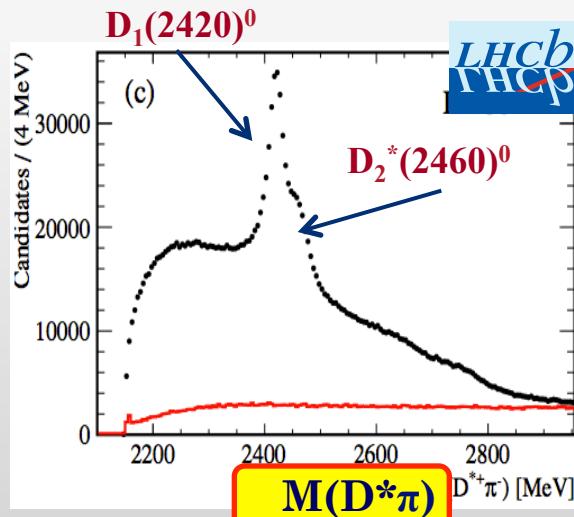

## Inclusive analysis

$$pp \rightarrow D^{(*)+} \pi^- + X$$

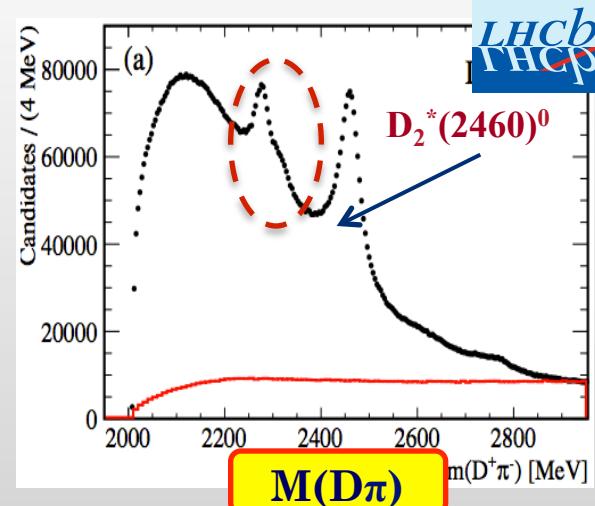

[LHCb: JHEP 09 (2013) 145]

(e.g) L=1,  $j_q = 3/2$  doublet

- 1 peak in  $D\pi$  3 peaks in  $D\pi$ ?
- 2 peaks in  $D^*\pi$

$j_q$	$J^P$	Allowed decay mode	
		$D\pi$	$D^*\pi$
$D_0^*$	$1/2$	$0^+$	yes no
$D_1'$	$1/2$	$1^+$	no yes
$D_1$	$3/2$	$1^+$	no yes
$D_2^*$	$3/2$	$2^+$	yes yes

# FEED-DOWNS OF $D_1/D_2^* \rightarrow D^*\pi$ DECAYS INTO $D\pi$ MASS SPECTRUM

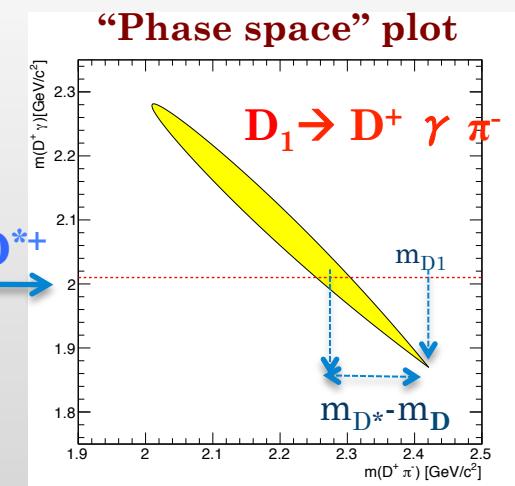

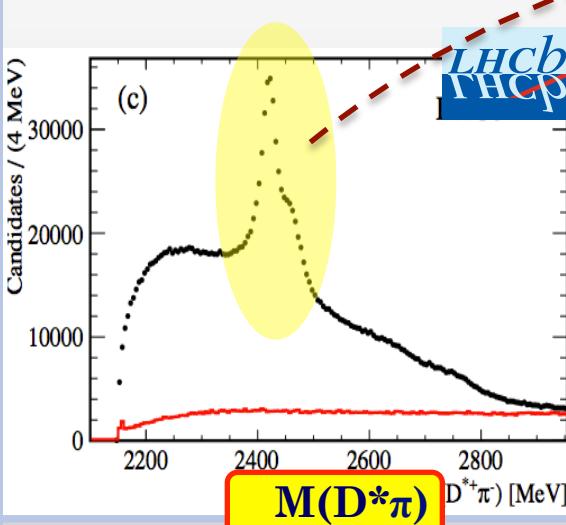

## Inclusive analysis

$$pp \rightarrow D^{(*)+} \pi^- + X$$

[LHCb: JHEP 09 (2013) 145]

$j_q = 3/2$  doublet

- 3 peaks in  $D\pi$ 
  - ✓  $D_2^* \rightarrow D\pi$
  - ✓  $D_1 \rightarrow D^*\pi$  feed-down } overlapped if  $\Gamma > m(D^*) - m(D)$
  - ✓  $D_2^* \rightarrow D^*\pi$  feed-down }
- 2 peaks in  $D^*\pi$

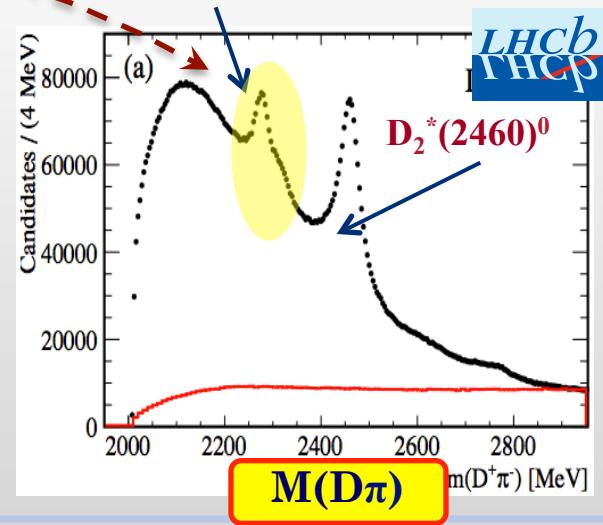

$j_q$	$J^P$	Allowed decay mode		
		$D\pi$	$D^*\pi$	
$D_0^*$	$1/2$	$0^+$	yes	no
$D_1'$	$1/2$	$1^+$	no	yes
$D_1$	$3/2$	$1^+$	no	yes
$D_2^*$	$3/2$	$2^+$	yes	yes

$D_1(2420)^0 / D_2^*(2460)^0$  feed-down

↳  $D^{*+} \pi^-$

↳  $D^+ \gamma/\pi^0$

# EXCITED D<sub>(s)</sub> STATES

- The charmed excited states studied in inclusive analyses and into B decays
- The orbitally L=1 excited D<sub>(s)</sub><sup>\*\*</sup> states observed first
- Masses and properties well predicted by theory (before the states were observed)

**D<sup>\*\*</sup> (L=1)**

**j<sub>q</sub> = 1/2 doublet**

**j<sub>q</sub> = 3/2 doublet**

	Mass (MeV)	Width (MeV)
$D_0^*(2400)^0$	$2318 \pm 29$	$267 \pm 40$
$D_0^*(2400)^\pm$	$2403 \pm 40$	$283 \pm 40$
$D_1(2430)^0$	$2427 \pm 40$	$384^{+130}_{-110}$
$D_1(2430)^\pm$	—	—
<hr/>		
$D_1(2420)^0$	$2421.4 \pm 0.6$	$27.4 \pm 2.5$
$D_1(2420)^\pm$	$2423.2 \pm 2.4$	$25 \pm 6$
<hr/>		
$D_2^*(2460)^0$	$2462.6 \pm 0.6$	$49.0 \pm 1.3$
$D_2^*(2460)^\pm$	$2464.3 \pm 1.6$	$37 \pm 6$

**D<sub>s</sub><sup>\*\*</sup> (L=1)**

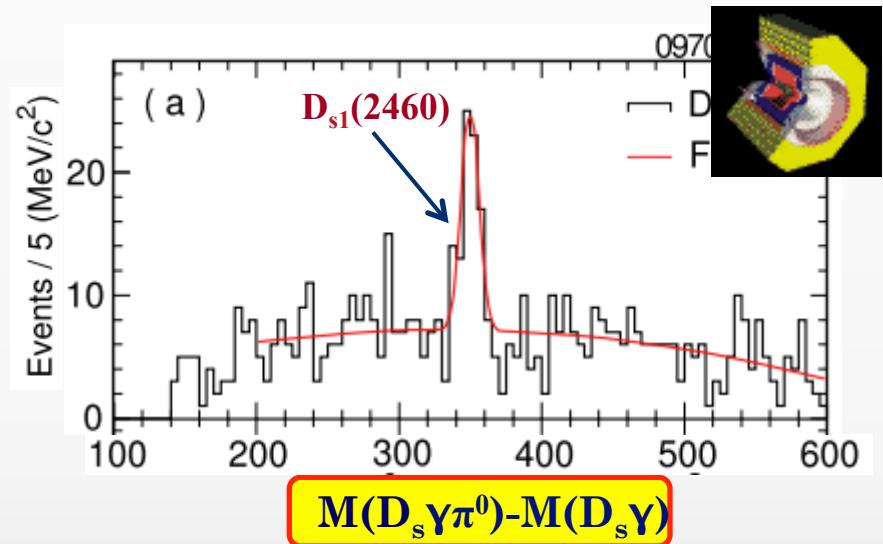

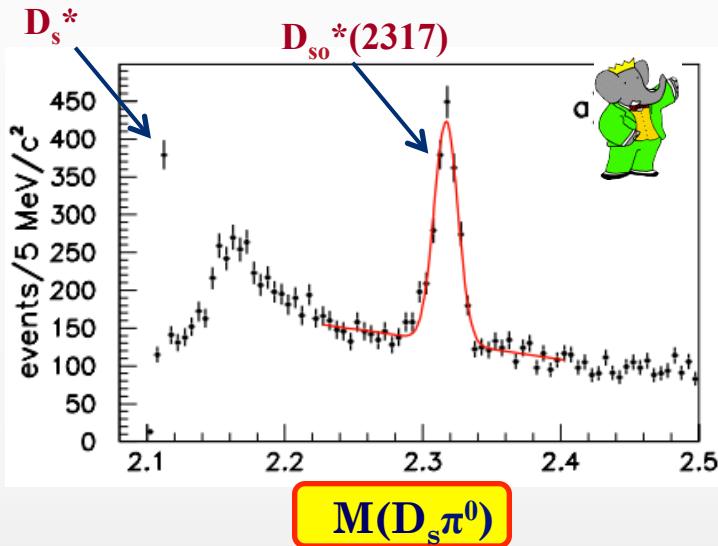

**j<sub>q</sub> = 3/2 doublet**

	Mass (MeV)	Width (MeV)
$D_{s0}^*$	—	—
$D'_{s1}$	—	—
<hr/>		
$D_{s1}(2536)^\pm$	$2535.10 \pm 0.08$	$0.92 \pm 0.05$
$D_{s2}^*(2573)^\pm$	$2571.9 \pm 0.8$	$17 \pm 4$

D<sub>s0</sub><sup>\*</sup> and D<sub>s1</sub>' states expected broad and to be studied in B<sub>s</sub> decays...

# PUZZLE: EXCITED $D_s$ MESONS: $L=1$ , $j_q = 1/2(?)$

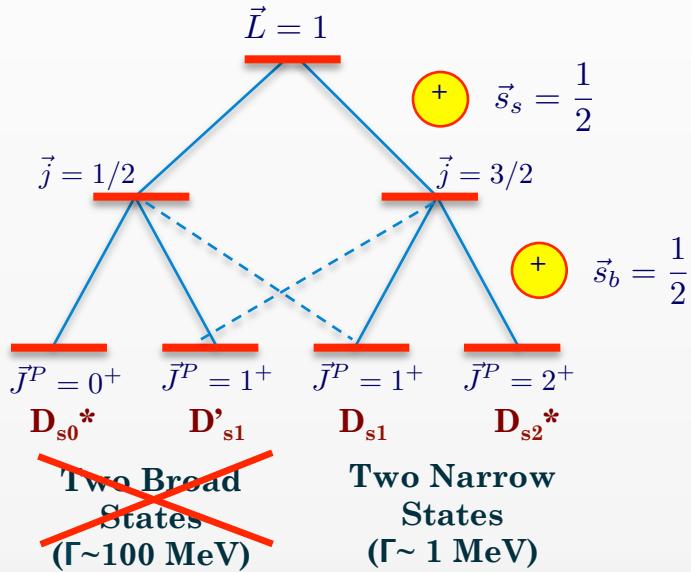

Inclusive studies of  $D_s^{(*)}\pi^0$   
 [BaBar, PRL90, 242001][CLEO, PRD68, 032002]

PDG	Mass (MeV)	Width (MeV)
$D_{s0}^*(2317)^{\pm}$	$2317.7 \pm 0.6$	$< 3.8$
$D_{s1}(2460)^{\pm}$	$2459.5 \pm 0.6$	$< 3.5$

Surprisingly  
narrow!

# PUZZLE: EXCITED D<sub>s</sub> MESONS: L=1, j<sub>q</sub> = 1/2(?)

~~$M(D_{s0}^{*+}) > m(D^0) + m(K^+)$~~

~~$M(D_{s1}^{*+})$~~ 
 ~~$M(D_{s1})$~~ 
 ~~$M(D_{s2}^{*+})$~~ 

$$\left. \begin{array}{l} M(D_{s1}^{*+}) \\ M(D_{s1}) \\ M(D_{s2}^{*+}) \end{array} \right\} > m(D^{*0}) + m(K^+)$$

$j_q$	$J^P$	Allowed decay mode	
		$D^0 K^+$	$D^{*0} K^+$
$D_{s0}^{*+}$	$1/2$	$0^+$	no
$D'_{s1}^{*+}$	$1/2$	$1^+$	no
$D_{s1}^{*+}$	$3/2$	$1^+$	no
$D_{s2}^{*+}$	$3/2$	$2^+$	yes

( $1^+ \rightarrow 0^- 0^-$  Forbidden)

- $D_{s0}^*/D_{s1}' \rightarrow D^{(*)} K$  kinematically forbidden
- Isospin violation decays:  $D_{s0}^* \rightarrow D_s \pi^0$  and  $D'_{s1} \rightarrow D_s^* \pi^0$

# PUZZLE:

## EXCITED D<sub>s</sub> MESONS: L=1, j<sub>q</sub> = 1/2(?)

- Spin-Parity J<sup>P</sup> = (0<sup>+</sup>, 1<sup>+</sup>) as expected for the L=1, j<sub>q</sub>=1/2 states
- B → DD<sub>s0</sub>\* branching ratios below expectations (i.e. ~1) for a q<sup>-</sup>q state [PLB572, 164 (2003)][PRD69, 054002 (2004)]

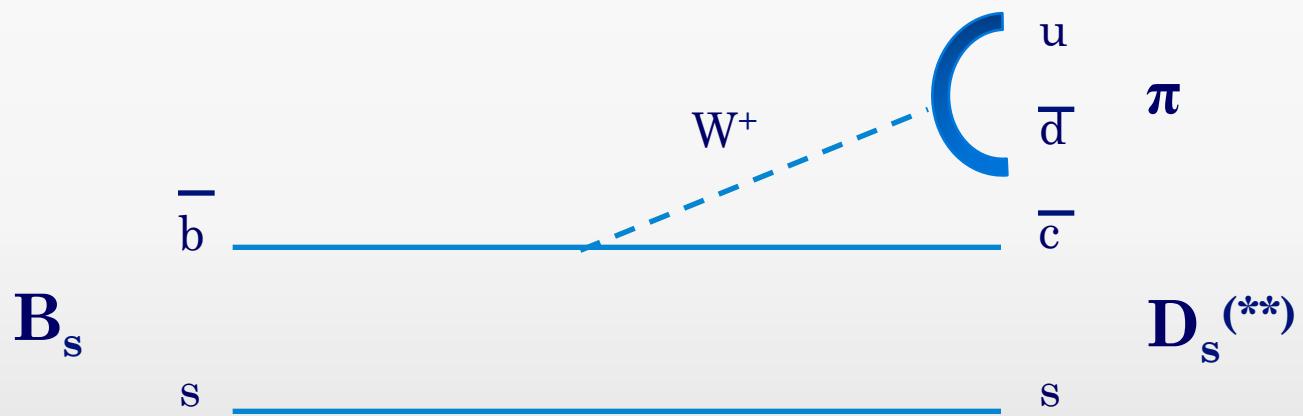

$$\frac{\mathcal{B}(B^+ \rightarrow \bar{D}^0 D_{s0}^{*+})}{\mathcal{B}(B^+ \rightarrow \bar{D}^0 D_s^+)} = 0.081^{+0.032}_{-0.025}$$
$$\frac{\mathcal{B}(B^0 \rightarrow D^- D_{s0}^{*+})}{\mathcal{B}(B^0 \rightarrow D^- D_s^+)} = 0.13 \pm 0.04$$

- Many alternative interpretations:  
DK or D<sub>s</sub> π molecule, q<sup>-</sup>q + tetraquark/DK mixing

No D<sub>s</sub><sup>+</sup>π<sup>±</sup> partners have been observed in inclusive studies [BaBar: PRD74 (2006) 032007] or in B decays [Belle: R.Chistov@ EPS-HEP, Stockholm, Sweden (18 July 2013)]

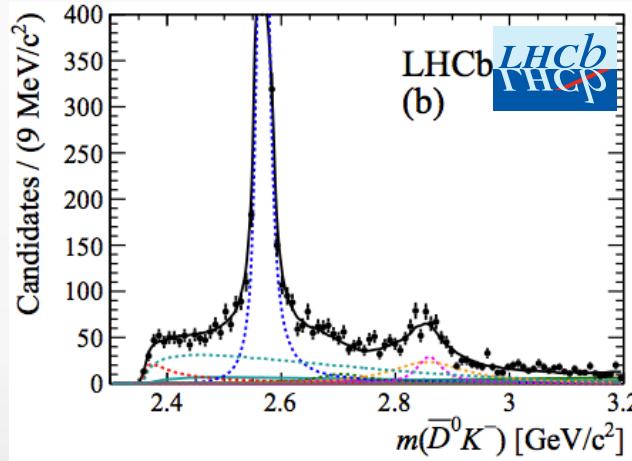

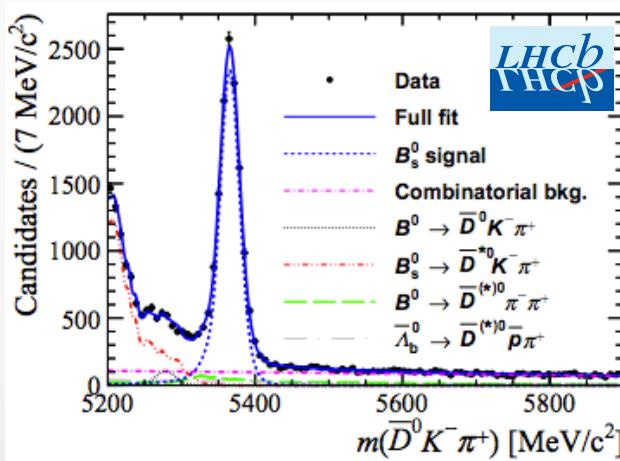

# SEARCH FOR “ $D_{s0}^*$ ” IN $B_s$ DECAYS

If the  $D_{s0}^*(2317)$  is not the  $L=1, j_q=1/2$  excited  $D_s$  state, then a broad  $D_{s0}^*$  state above the DK threshold should appear in  $B_s$  decays

# SEARCH FOR “ $D_{s0}^*$ ” IN $B_s$ DECAYS

Amplitude analysis of  $B_s \rightarrow \bar{D}^0 K^- \pi^+$

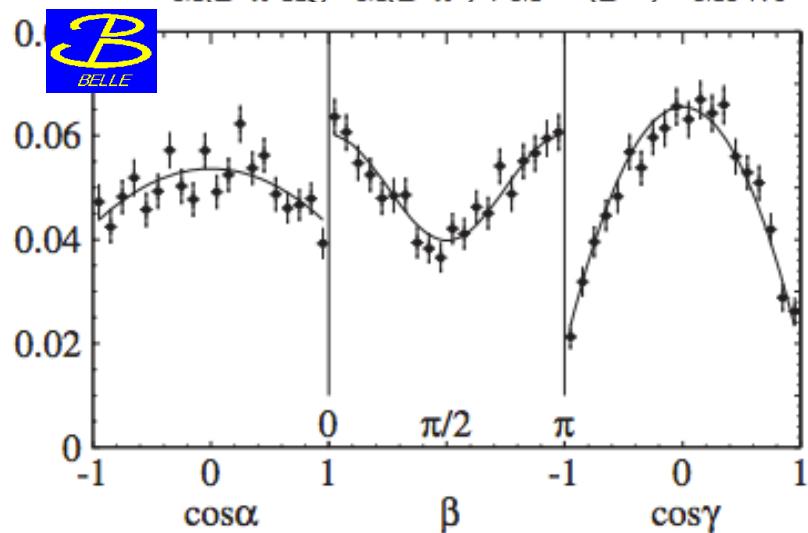

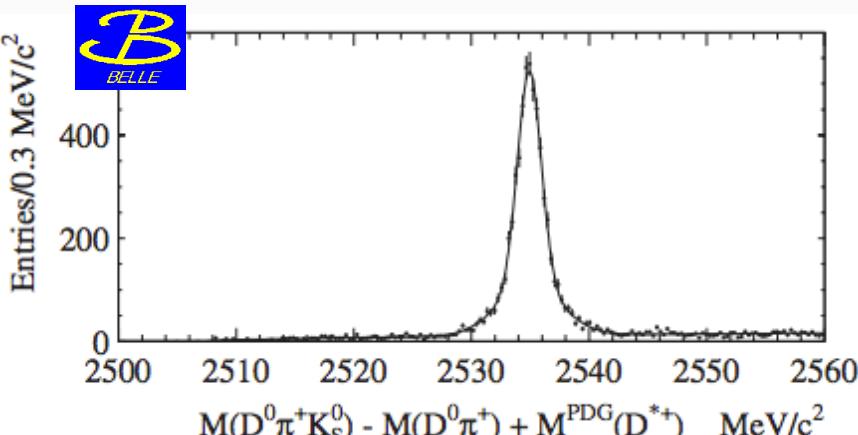

No evidence for such a broad  $D_{s0}^*$  state

[LHCb: PRL 113, 162001 (2014)]  
 [LHCb: PRD 90, 072003 (2014)]

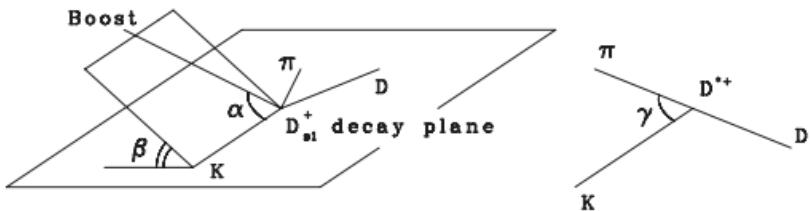

Resonance	Fit fraction (%)
$\bar{K}^*(892)^0$	$28.6 \pm 0.6$
$\bar{K}^*(1410)^0$	$1.7 \pm 0.5$
LASS nonresonant	$13.7 \pm 2.5$
$\bar{K}_0^*(1430)^0$	$20.0 \pm 1.6$
LASS total	$21.4 \pm 1.4$
$\bar{K}_2^*(1430)^0$	$3.7 \pm 0.6$

# INTERPRETATION

[LHCb, JHEP 09 (2013) 145]

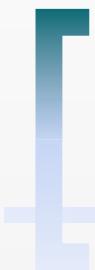

$D_J(2580)$  could be identified with the  $D(2S)$  (e.g.  $D_0(2558)$ )

$D_J^*(2650)$  could be identified as the  $J^P=1^-$   $D^*(2S)$  (i.e.  $D_1^*(2618)$ )

$D_J(2740)$  could be identified as the  $J^P=2^-$   $D_2(1D)$  (i.e.  $D_2(2801)$ )

$D_J^*(2760)$  could be identified as the  $J^P=1^-$   $D_1^*(1D)$  (i.e.  $D_1^*(2796)$ )

Study of  $D^{(*)}\pi$  spectrum from B decays  
needed to establish spin-parity

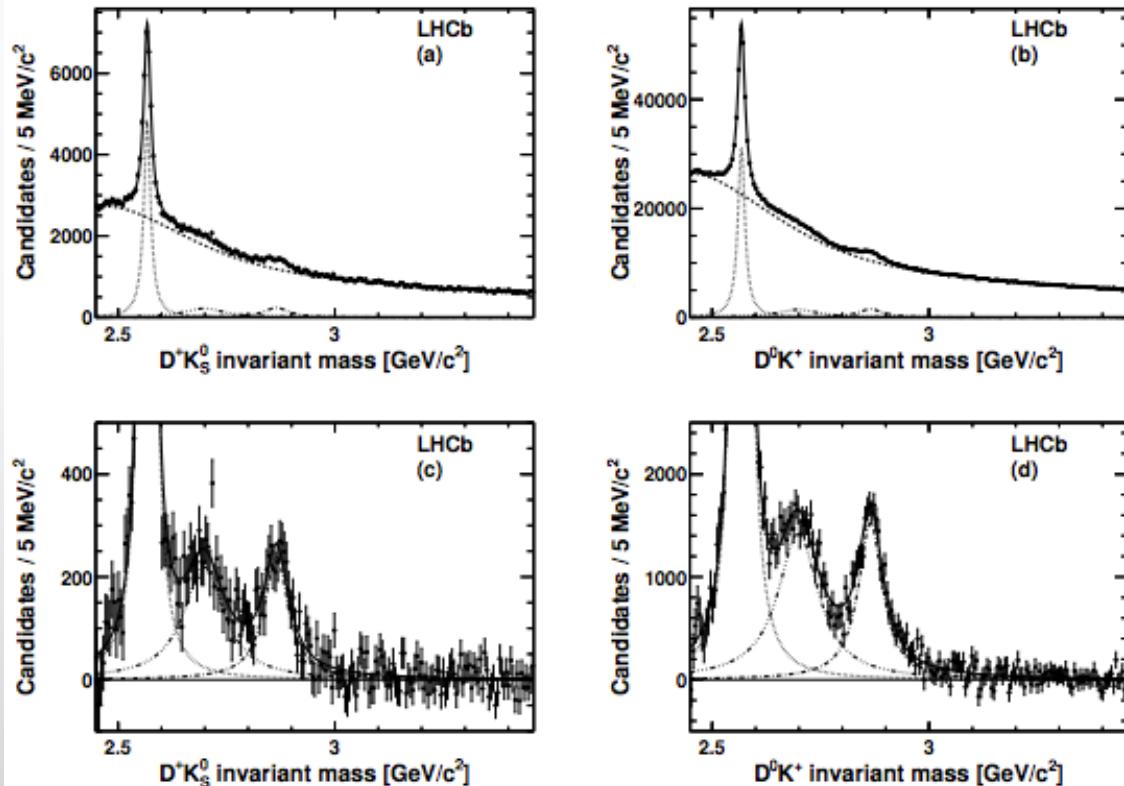

# Excited $D_s^{**} \rightarrow DK$ @ LHCb

# EXCITED D<sub>sJ</sub> STATES

[LHCb, JHEP 10 (2012) 151]

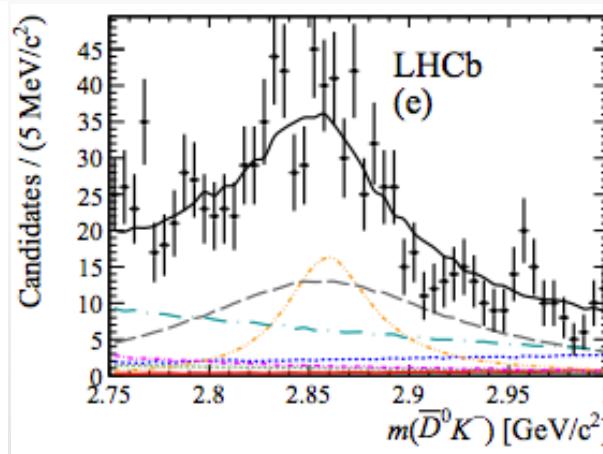

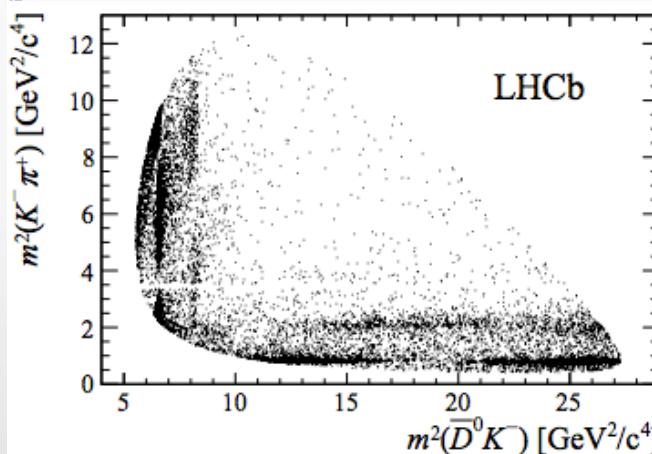

LHCb collaboration has recently confirmed 2 broad states decaying to DK:  
 $D_{s1}^*(2700)^+$  &  $D_{sJ}^*(2860)^+$

# EXCITED D<sub>sJ</sub> STATES

[LHCb: PRL 113, 162001 (2014)]  
 [LHCb: PRD 90, 072003 (2014)]

- LHCb has performed a Dalitz Plot analysis of  $B_s \rightarrow \bar{D}^0 K \pi$
- D<sub>sJ</sub><sup>\*</sup>(2860)<sup>+</sup> consist of (at least) 2 overlapping states J<sup>P</sup>=1<sup>-</sup> & 3<sup>-</sup>

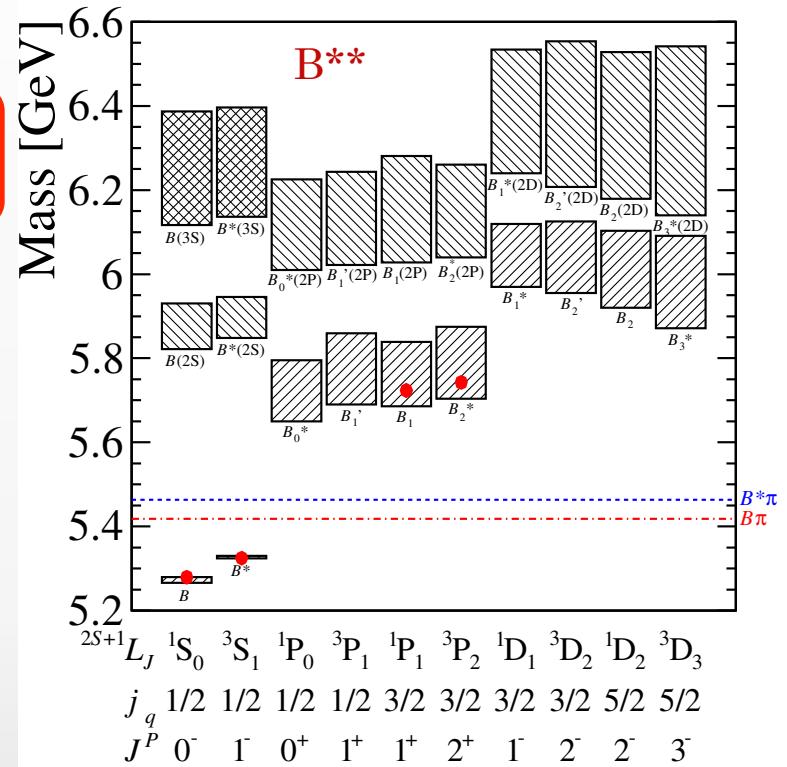

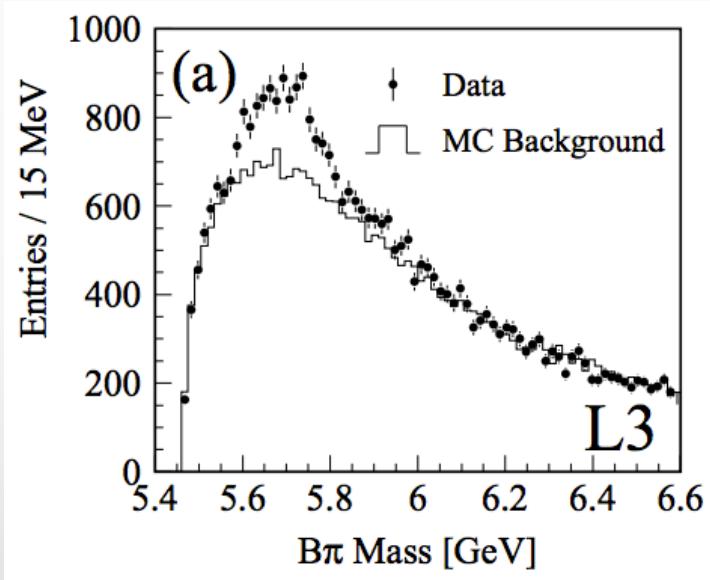

Resonance	Fit fraction (%)
$\bar{K}^*(892)^0$	$28.6 \pm 0.6$
$\bar{K}^*(1410)^0$	$1.7 \pm 0.5$
LASS nonresonant	$13.7 \pm 2.5$
$\bar{K}_0^*(1430)^0$	$20.0 \pm 1.6$
LASS total	$21.4 \pm 1.4$
$\bar{K}_2^*(1430)^0$	$3.7 \pm 0.6$
$\bar{K}^*(1680)^0$	$0.5 \pm 0.4$
$\bar{K}_0^*(1950)^0$	$0.3 \pm 0.2$
$D_{s2}^*(2573)^-$	$25.7 \pm 0.7$
$D_{s1}^*(2700)^-$	$1.6 \pm 0.4$
$D_{s1}^*(2860)^-$	$5.0 \pm 1.2$
$D_{s3}^*(2860)^-$	$2.2 \pm 0.1$
Nonresonant	$12.4 \pm 2.7$
$D_{sv}^*$	$4.7 \pm 1.4$
$D_{s0v}^*(2317)^-$	$2.3 \pm 1.1$
$B_v^{*-}$	$1.9 \pm 1.2$
Total fit fraction	$124.3$

Resonance	Mass ( $\text{MeV}/c^2$ )	Width ( $\text{MeV}/c^2$ )
$D_{s2}^*(2573)^-$	$2568.39 \pm 0.29$	$16.9 \pm 0.5$
$D_{s1}^*(2860)^-$	$2859 \pm 12$	$159 \pm 23$
$D_{s3}^*(2860)^-$	$2860.5 \pm 2.6$	$53 \pm 7$

# Excited $B^{**} \rightarrow B\pi$ @ LHCb

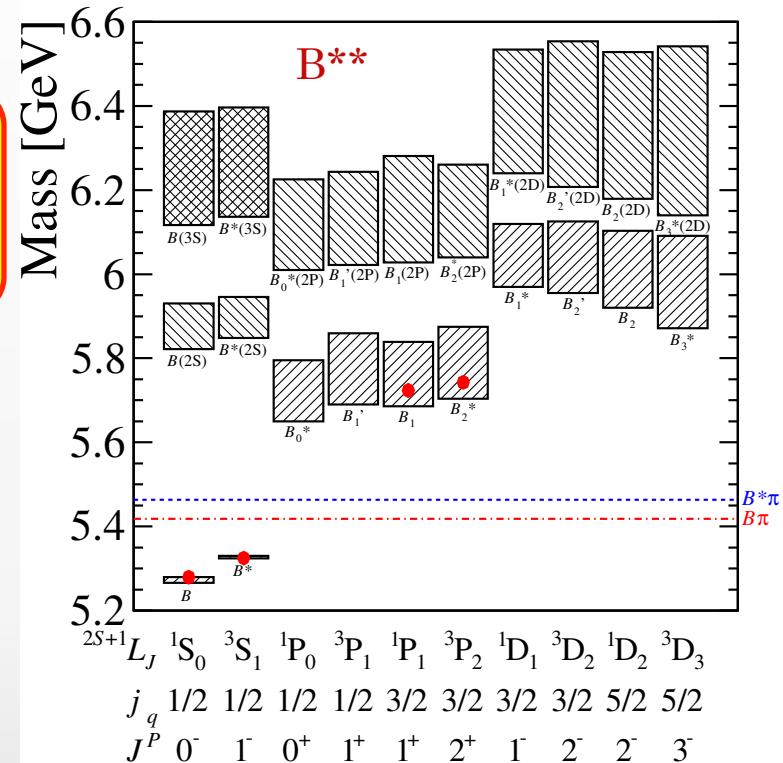

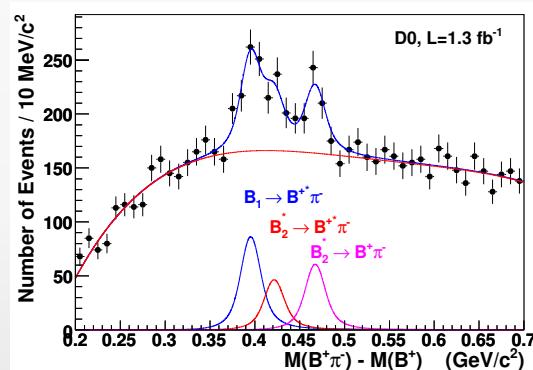

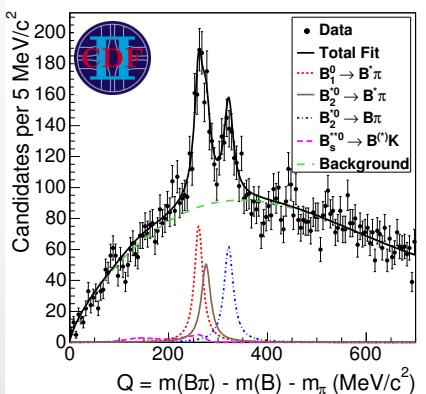

# THE EXCITED B STATES

- LEP experiments observed a single broad structure ( $\Gamma > 100$  MeV) in  $B^+\pi^-$ :  $B_J^*(5732)$

# THE EXCITED B STATES

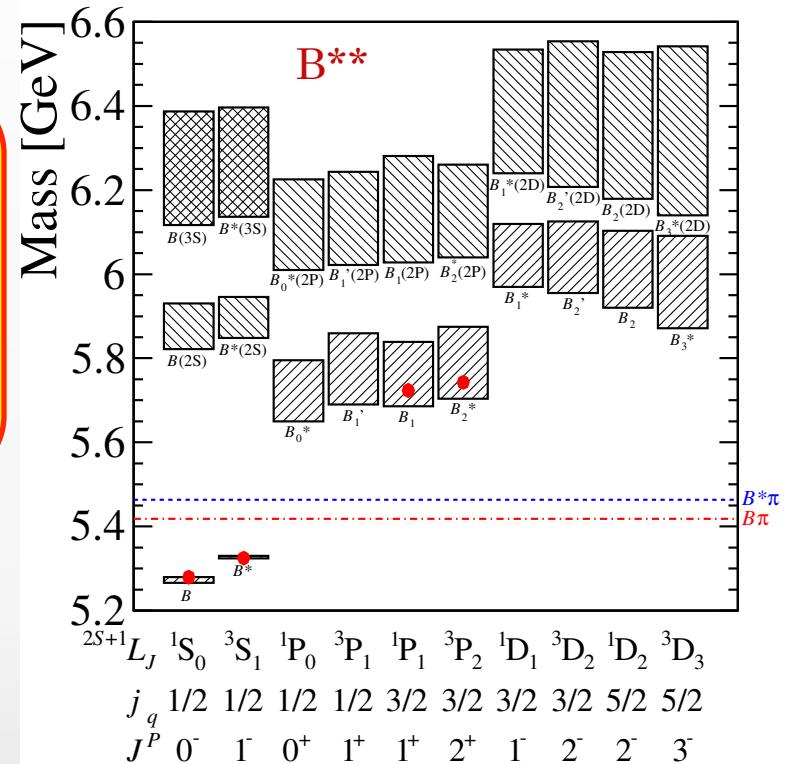

- LEP experiments observed a single broad structure ( $\Gamma > 100$  MeV) in  $B^+\pi$ :  $B_J^{**}(5732)$
- Tevatron experiments resolved it into 2 structures and interpreted the former as the overlap of  $B_1^{*0}/B_2^{*0} \rightarrow B^{*+}\pi^-$

# THE EXCITED B STATES

- LEP experiments observed a single broad structure ( $\Gamma > 100$  MeV) in  $B^+\pi$ :  $B_J^*(5732)$
- Tevatron experiments resolved it into 2 structures and interpreted the former as the overlap of  $B_1^0/B_2^{*0} \rightarrow B^{*+}\pi^-$
- LHCb reported the first observation of the charged  $B_1^+$  and  $B_2^{*+}$  [LHCb-CONF-2011-053]
- CDF reported the evidence of a broad state:  $B(5970)^{0,+}$

	Mass (MeV)	Width (MeV)
$B(5970)^0$	$5978 \pm 5 \pm 12$	$70_{-20}^{+30} \pm 30$
$B(5970)^+$	$5961 \pm 5 \pm 12$	$60_{-20}^{+30} \pm 40$

In previous analyses, fit models made use of several external inputs:  
 $m(B^*) - m(B)$  (exp.),  $\text{Br}(B_2^* \rightarrow B^*\pi)/\text{Br}(B_2^* \rightarrow B\pi)$  (theor.),  $\Gamma(B_1)/\Gamma(B_2^*)$  (theor.)

# INCLUSIVE STUDY OF THE $B^+\pi^-$ AND $B^0\pi^+$ MASS SPECTRA

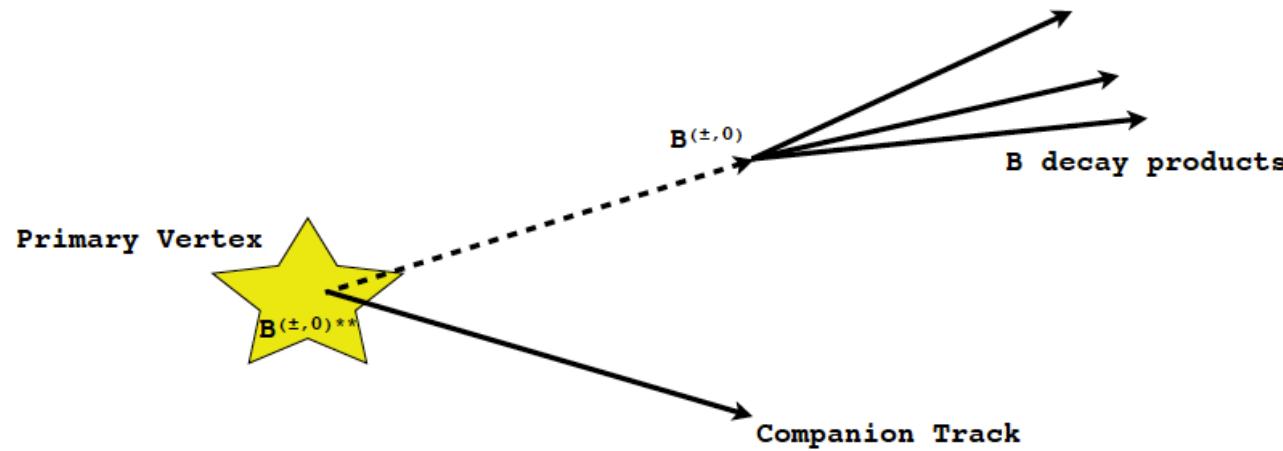

[LHCb-PAPER-2014-067; arXiv:1502.02638]

## Analysis strategy

- 2011+2012 data sample corresponding to  $\mathcal{L} = 3.0 \text{ fb}^{-1}$
- Selection of a high purity  $B^+$  and  $B^0$  samples
- The  $B^+$  ( $B^0$ ) candidates combined with  $\pi^- (\pi^+)$  originating from the interaction point
- Analysis carried out by fitting the  $Q$  distributions:

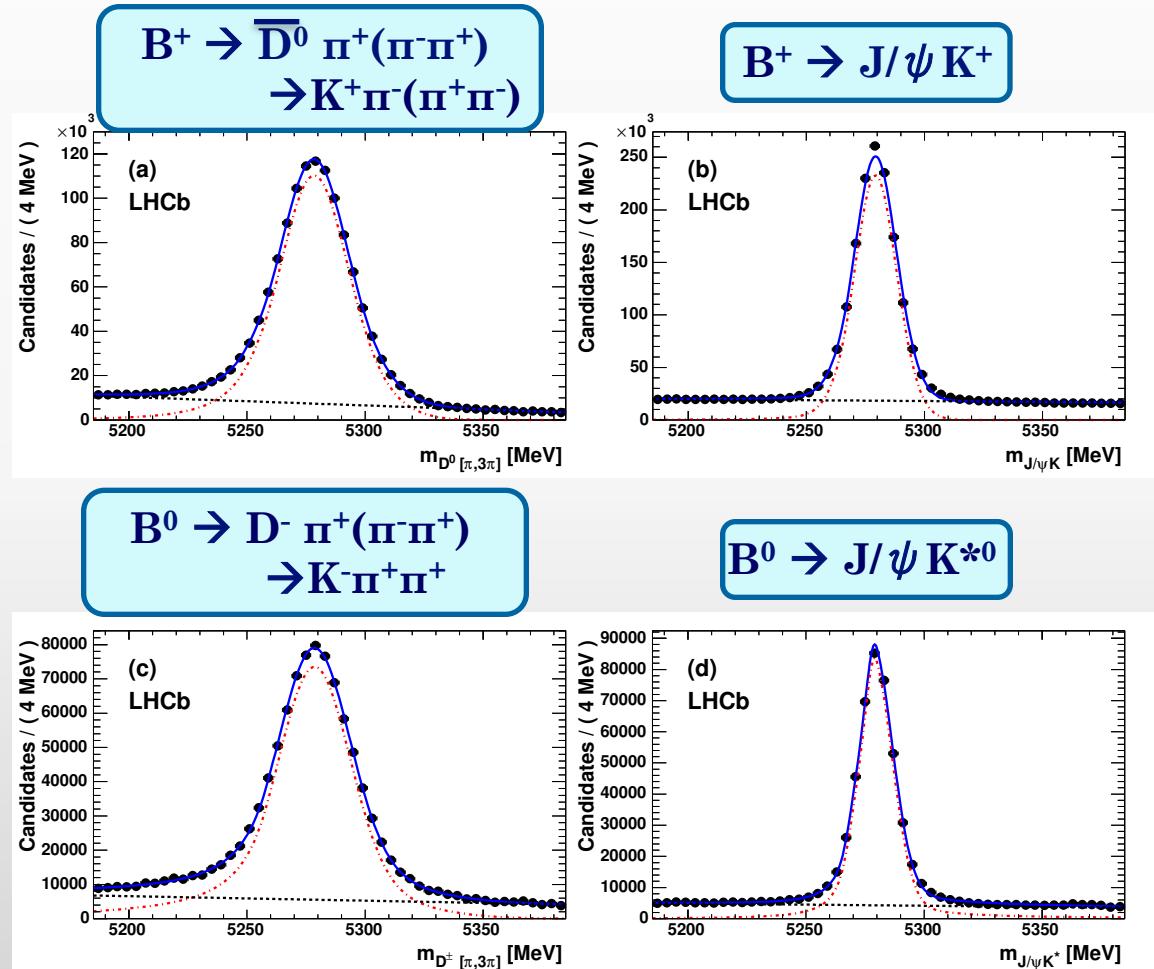

$$Q \equiv m(B\pi) - m(B) - m(\pi)$$

# B<sup>0,+</sup> CANDIDATES

[LHCb-PAPER-2014-067; arXiv:1502.02638]

- Purity of B samples > 80%
- ~2.5M of B<sup>+</sup> candidates and 1.2M of B<sup>0</sup> candidates in 3.0 fb<sup>-1</sup>

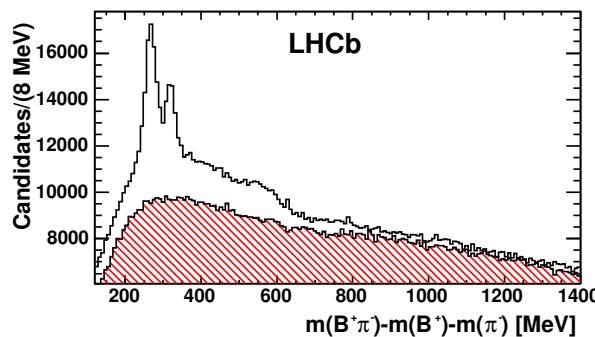

J/ $\psi$ /D<sup>0</sup>/D<sup>-</sup> masses constrained to their known values to improve signal resolutions

# SPECTRUM OF $m(B\pi)$ - $m(B)$ - $m(\pi)$ MASS DIFFERENCES

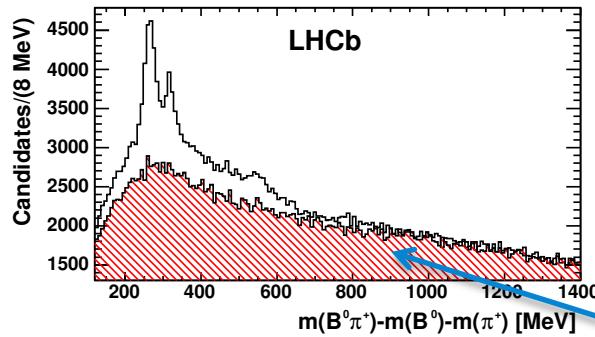

[LHCb-PAPER-2014-067; arXiv:1502.02638]

- Two narrow peaks are seen in both  $B^+\pi^-$  and  $B^0\pi^+$  spectra interpreted as the decays of  $B_1(5721)\rightarrow B^*\pi$  and  $B_2^*(5747)\rightarrow B^{(*)}\pi$
- An excess of RS over WS combinations around  $Q \sim 500$  MeV. Particularly prominent when  $p_T$  of companion pion  $> 2$  GeV
- Furthermore a comparison with the WS shows a very broad excess of RS lying under the resonances (Associated Production)

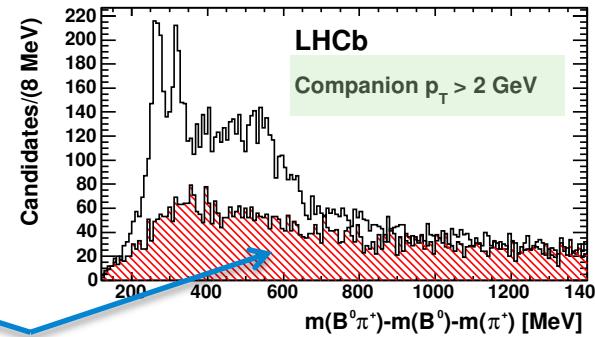

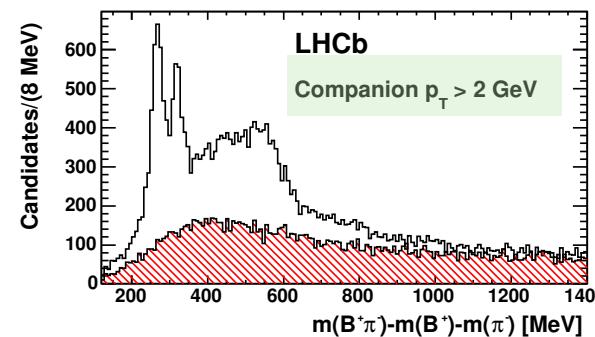

$B^+\pi^-$

$B^0\pi^+$

WS

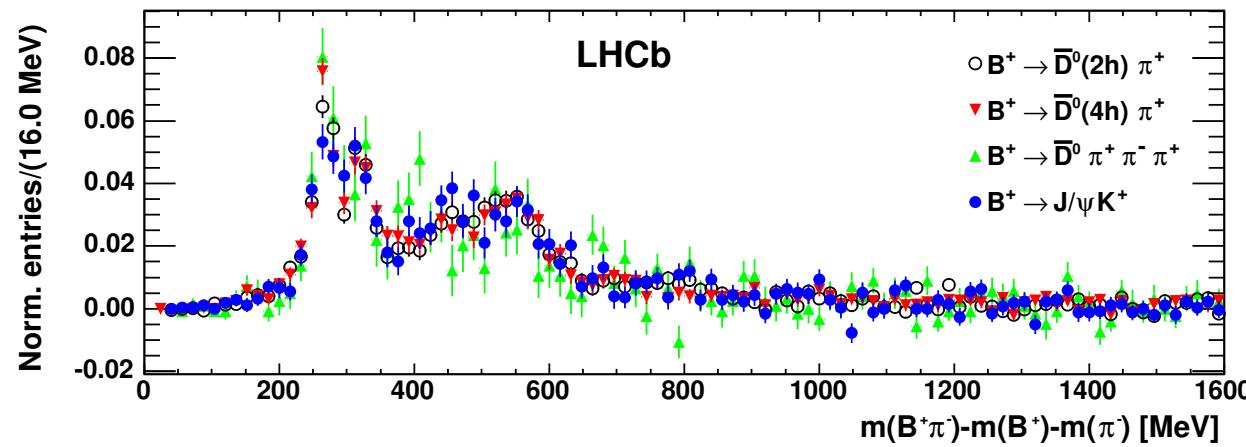

# SPECTRUM OF $m(B\pi)$ - $m(B)$ - $m(\pi)$ MASS DIFFERENCES

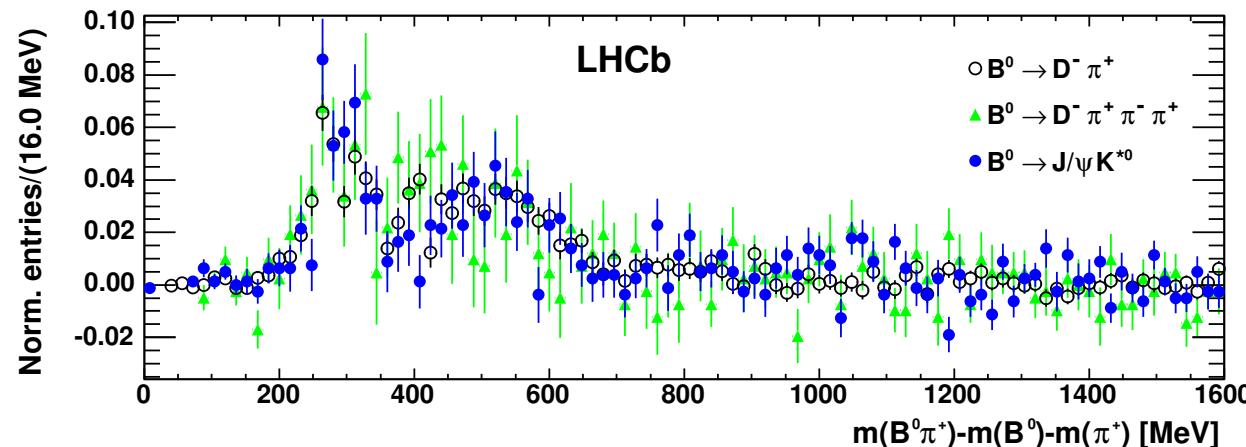

[LHCb-PAPER-2014-067; arXiv:1502.02638]

- Normalized WS subtracted Q value spectra
- Compatibility of the observed signals in all decay modes

$B^+\pi^-$

$B^0\pi^+$

# FIT MODEL

[LHCb-PAPER-2014-067; arXiv:1502.02638]

Empirical Model  $\equiv$  Minimal choice

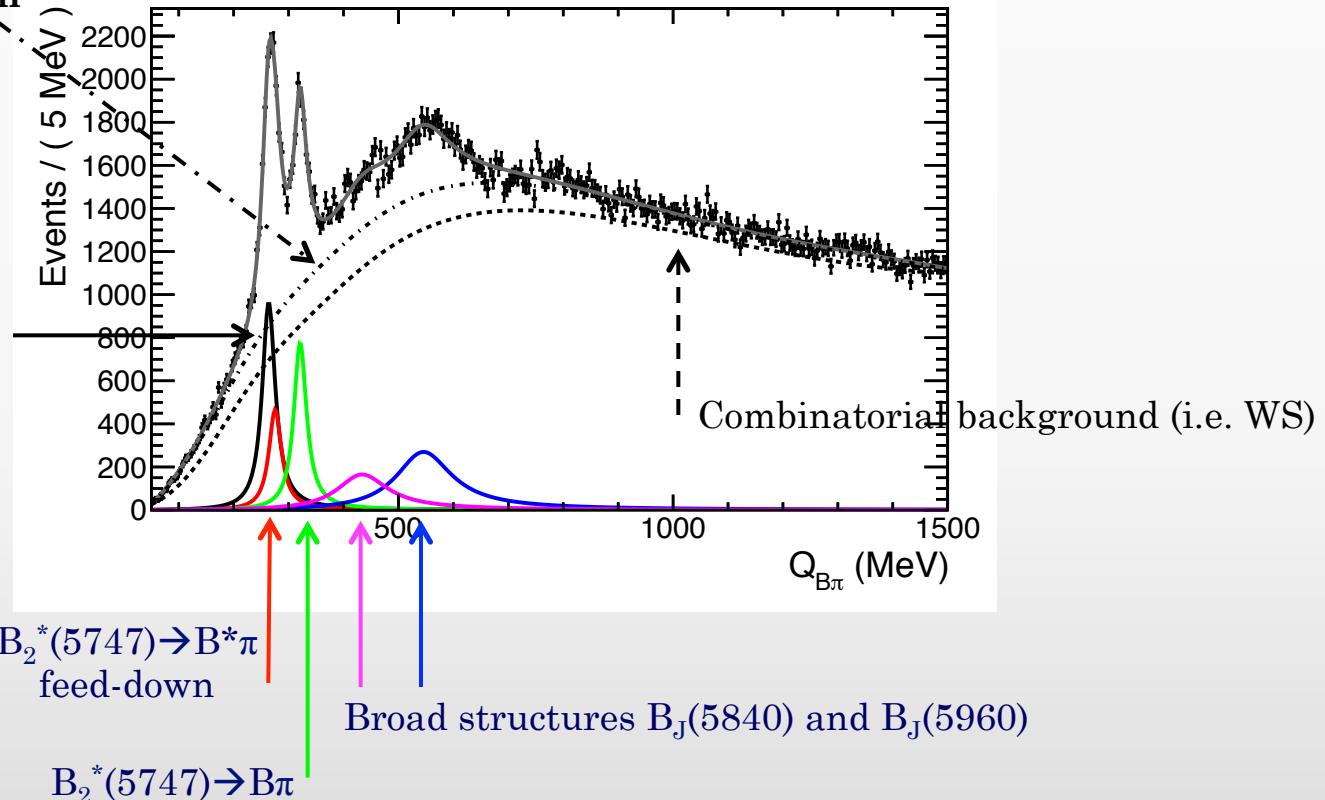

## Associated Production

(Broad resonances

$+$

correlated nonresonant  
production of  $B$  and  $\pi$  in the  
fragmentation chain)

$B_1(5721) \rightarrow B^*\pi$   
feed-down

Alternative fit models ( $\equiv$  Quark Model) consider the two broad states belonging to the same doublet. Then an extra fit function is added for the  $B_J \rightarrow B^*\pi$  feed-down

# FIT MODEL

[LHCb-PAPER-2014-067; arXiv:1502.02638]

	Fit function	Constraints
Signals	Relativistic Breit-Wigner (RBW) [Negligible resolutions $\sim 2$ MeV]	$m(B^*) - m(B)$ for $B^{**} \rightarrow B^* \pi$ feed-downs
Combinatorial Background	Linear combination of spline polynomials	From WS (event mixing as cross check)
Associated Production	Polynomial + Broad RBW shape	From simulation

- Binned  $\chi^2$  fit for  $B^+\pi^-$  and  $B^0\pi^+$  (Bin size = 1 MeV)
- Data samples split in 3 companion  $p_T$  bins [ $0.5 < p_T < 1$  GeV;  $1 < p_T < 2$  GeV,  $p_T > 2$  GeV]
- Fitting steps:
  - ✓ Fit the WS shapes
  - ✓ Simultaneous fit by fixing the combinatorial background from WS and the AP from simulation + broad RBW shape (varied appropriately for systematics)
- Signals parameters (masses and widths) shared between companion  $p_T$  bins
- No theoretical constraints

# NOMINAL FIT RESULTS BY $P_T$ BIN

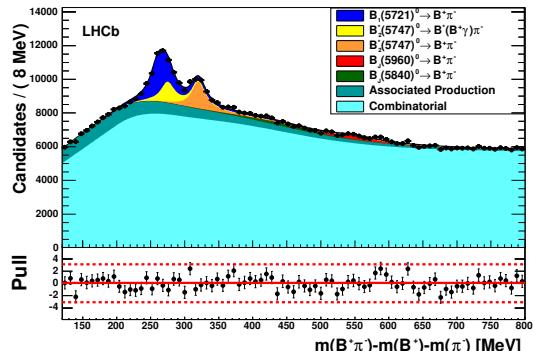

[LHCb-PAPER-2014-067; arXiv:1502.02638]

$0.5 < p_T < 1 \text{ GeV}$

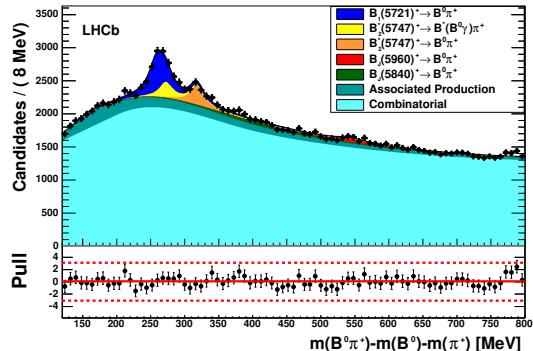

$1 < p_T < 2 \text{ GeV}$

$p_T > 2 \text{ GeV}$

$B^+\pi^-$

$B^0\pi^+$

  $B_s(5721)^0 \rightarrow B^{++}(B^+\gamma)\pi^-$   
  $B_s(5747)^0 \rightarrow B^{++}(B^+\gamma)\pi^-$   
  $B_s(5747)^0 \rightarrow B^+\pi^-$

  $B_s(5960)^+ \rightarrow B^0\pi^+$   
  $B_s(5840)^+ \rightarrow B^0\pi^+$   
 Associated Production  
 Combinatorial

# NOMINAL FIT RESULTS

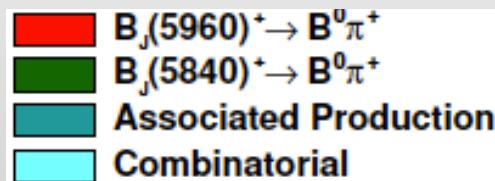

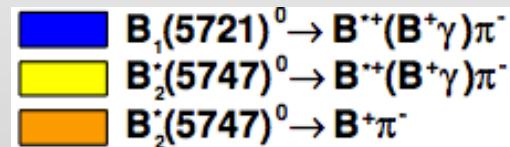

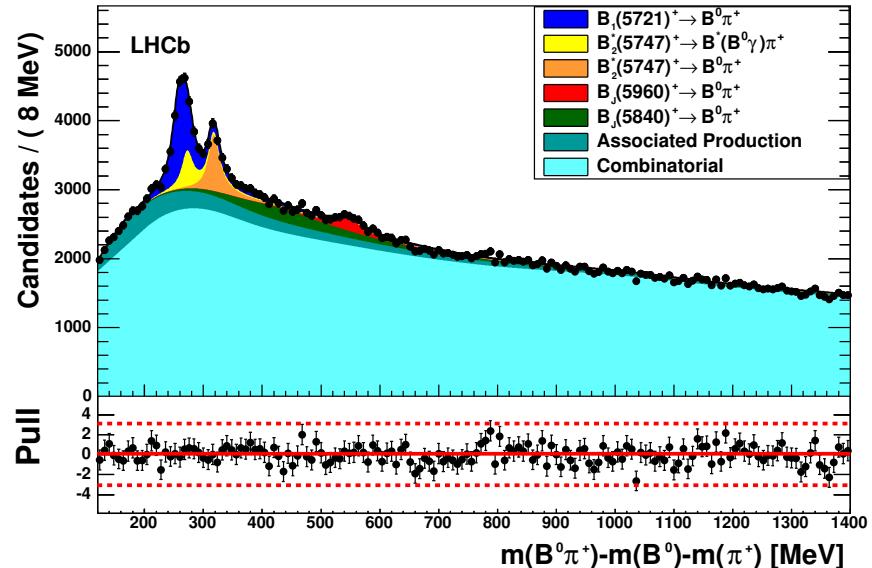

[LHCb-PAPER-2014-067; arXiv:1502.02638]

Candidates integrated over the 3  $p_T$  bins

$B^+\pi^-$

$B^0\pi^+$

# FINAL RESULTS:

## $B_1(5721)^{0,+}$ AND $B_2^*(5747)^{0,+}$

[LHCb-PAPER-2014-067; arXiv:1502.02638]

Q values converted into absolute masses by adding the known B,  $\pi$  and  $B^*$ -B masses

		stat.		syst.		B mass		B*-B mass	
$m_{B_1(5721)^0}$	=	5727.7	$\pm$	0.7	$\pm$	1.4	$\pm$	0.17	$\pm$ 0.4 MeV ,
$m_{B_2^*(5747)^0}$	=	5739.44	$\pm$	0.37	$\pm$	0.33	$\pm$	0.17	MeV ,
$m_{B_1(5721)^+}$	=	5725.1	$\pm$	1.8	$\pm$	3.1	$\pm$	0.17	$\pm$ 0.4 MeV ,
$m_{B_2^*(5747)^+}$	=	5737.20	$\pm$	0.72	$\pm$	0.40	$\pm$	0.17	MeV ,
$\Gamma_{B_1(5721)^0}$	=	30.1	$\pm$	1.5	$\pm$	3.5			MeV ,
$\Gamma_{B_2^*(5747)^0}$	=	24.5	$\pm$	1.0	$\pm$	1.5			MeV ,
$\Gamma_{B_1(5721)^+}$	=	29.1	$\pm$	3.6	$\pm$	4.3			MeV ,
$\Gamma_{B_2^*(5747)^+}$	=	23.6	$\pm$	2.0	$\pm$	2.1			MeV .

Most precise measurements of the  $B_1(5721)$  and  $B_2^*(5747)$  masses and widths

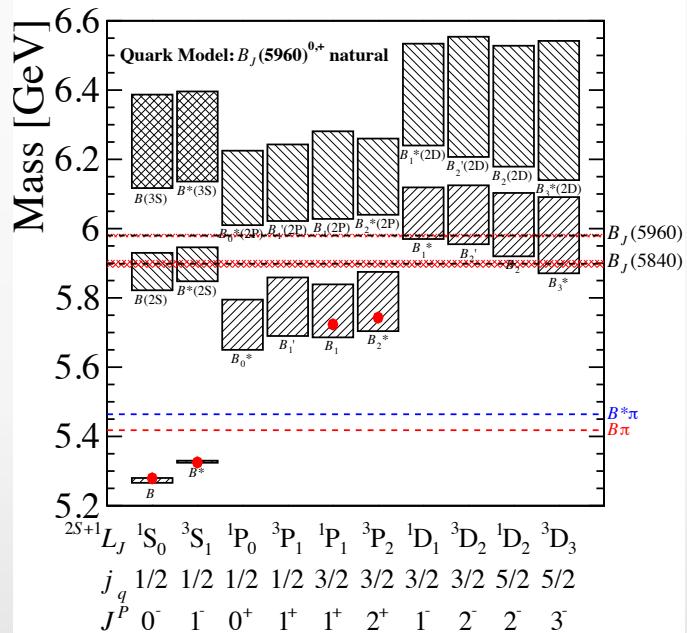

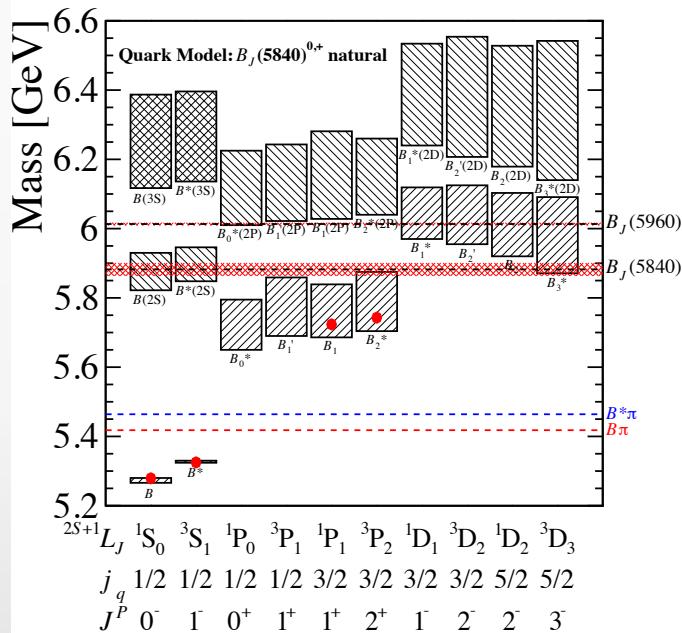

$$\begin{aligned} \frac{\mathcal{B}(B_2^*(5747)^0 \rightarrow B^{*+}\pi^-)}{\mathcal{B}(B_2^*(5747)^0 \rightarrow B^+\pi^-)} &= 0.71 \pm 0.14 \pm 0.30, \\ \frac{\mathcal{B}(B_2^*(5747)^+ \rightarrow B^{*0}\pi^+)}{\mathcal{B}(B_2^*(5747)^+ \rightarrow B^0\pi^+)} &= 1.0 \pm 0.5 \pm 0.8, \end{aligned}$$

First evidence of the  
 $B_2^*(5747)^0 \rightarrow B^{*+}\pi^-$  ( $3.7\sigma$ )!

# FINAL RESULTS: $B_J(5840)^{0,+}$ AND $B_J(5960)^{0,+}$

[LHCb-PAPER-2014-067; arXiv:1502.02638]

The properties of the  $B_J(5960)^{0,+}$  states are consistent with and more precise than those obtained by the CDF collaboration when assuming decay only to  $B\pi$

If the  $B_J(5840)^{0,+}$  and  $B_J(5960)^{0,+}$  states are considered under the quark model hypothesis, their properties are consistent with those expected for the  $B(2S)$  and  $B^*(2S)$  radially excited states

# SIGNIFICANCE DETERMINATION: $B_J(5840)^{0,+}$ AND $B_J(5960)^{0,+}$

[LHCb-PAPER-2014-067; arXiv:1502.02638]

Lack of knowledge of the AP shape  $\Rightarrow$  Large systematic uncertainty on the yields

Are  $B_J(5840)$  and  $B_J(5960)$  an artefact of the non-resonant AP?

- Generation of pseudoexperiments without any high mass states included
- Fitting with and without an additional high mass state
- Comparing the  $\chi^2$  difference to that obtained from the corresponding fits to data
- Generation of pseudoexperiments with a single mass state to investigate the significance of a 2<sup>nd</sup> state

$B^+\pi^-$ :  $9.6\sigma$  for at least one resonance,  $7.5\sigma$  for two  
 $B^0\pi^+$ :  $4.8\sigma$  for at least one resonance,  $4.6\sigma$  for two

Consistent with the interpretation of 4 states given the expected isospin symmetry

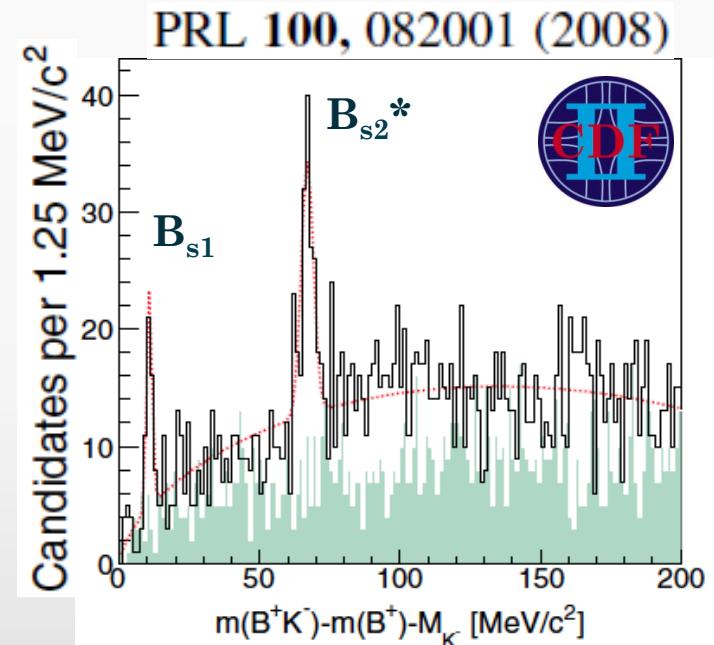

# Excited $B_s^{**} \rightarrow BK$ @ LHCb

# EXPERIMENTAL STATUS: $B_{s1}(5830)^0$ AND $B_{s2}^*(5840)^0$

- Two narrow peaks observed in the  $B^+K^-$  by CDF
- $B_{s2}^*$  is the only narrow state expected. What is the nature of the second signal?

$j_q$	$J^P$	Allowed decay mode	
		$B^+K^-$	$B^{*+}K^-$
$B_{s0}^*$	$1/2$	$0^+$	yes      no
$B'_{s1}$	$1/2$	$1^+$	no      yes
$B_{s1}$	$3/2$	$1^+$	no <b>yes</b>
$B_{s2}^*$	$3/2$	$2^+$	yes      yes

- It is interpreted as a feed-down of the  $B_{s1} \rightarrow B^{*+}K^-$  decay followed by  $B^{*+} \rightarrow B^+ \gamma$ , where the photon is not observed
- Swapping the identification would lead to a large mass splitting of the  $j=3/2$  doublet
- The  $B_{s1}$  state is not confirmed by D0

# SEARCH FOR $B_{s1}$ AND $B_{s2}^*$ AT LHCb

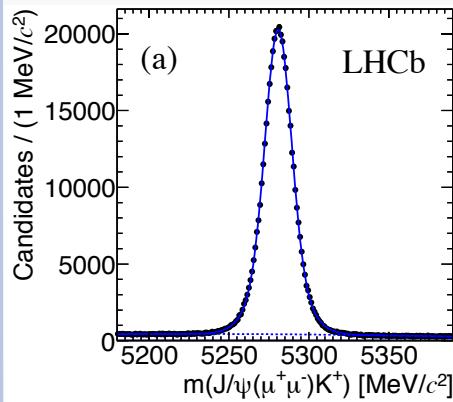

## Analysis strategy

- 2011 data sample corresponding to  $\mathcal{L} = 1.0 \text{ fb}^{-1}$
- Selection of a high purity  $B^+$  sample
- The  $B^+$  candidates are combined with a track of opposite charge that is identified as a kaon
- Optimization of the  $B_{s1}$  and  $B_{s2}^*$  in the  $B^+K^-$  mass spectrum

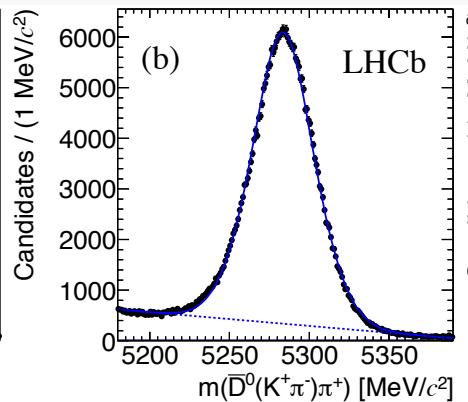

# B<sup>+</sup> CANDIDATES

- B<sup>+</sup> samples with purity ~85% - 95%
- ~1M of B<sup>+</sup> candidates

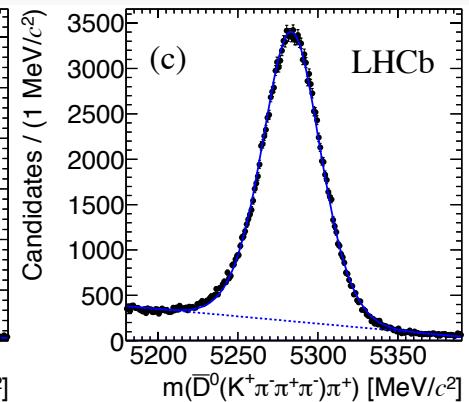

$B^+ \rightarrow J/\psi K^+$

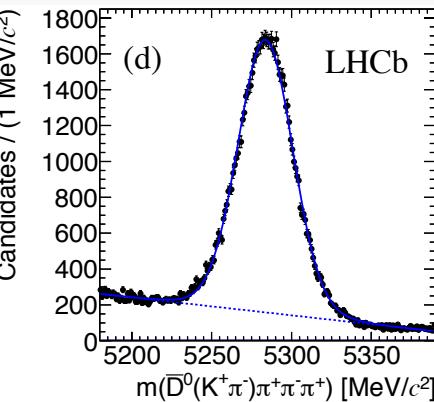

$B^+ \rightarrow \bar{D}^0 \pi^+ \rightarrow K^+ \pi^-$

$B^+ \rightarrow \bar{D}^0 \pi^+ \rightarrow K^+ \pi^-\pi^+\pi^+$

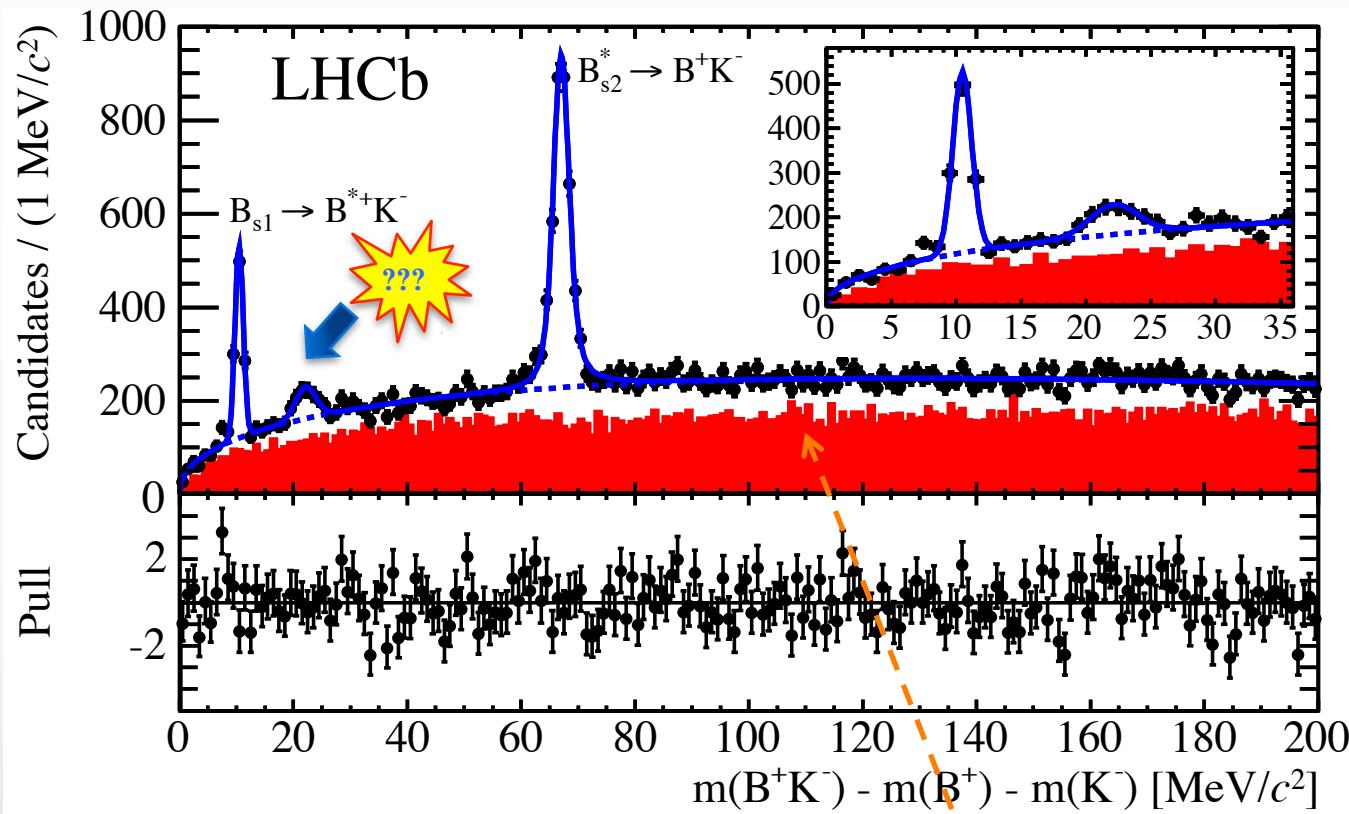

$B^+ \rightarrow \bar{D}^0 \pi^+\pi^-\pi^+ \rightarrow K^+ \pi^-$

- B<sup>+</sup> candidates, within a  $\pm 2\sigma$  mass region, combined with K<sup>-</sup>
- The B<sup>+</sup>K<sup>-</sup> candidates are refitted:
  - ✓ Primary vertex constraint (i.e. B<sup>+</sup> and K<sup>-</sup> are forced to come from the primary vertex)
  - ✓ B<sup>+</sup> and J/ψ (D<sup>0</sup>) mass constraint

# SPECTRUM OF $M(BK) - M(B) - M(K)$ MASS DIFFERENCE

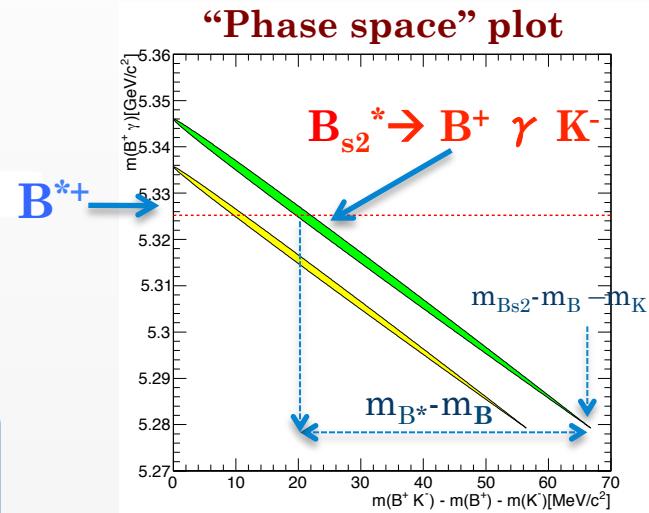

- The two narrow peaks corresponding to the  $B_{s1} \rightarrow B^{*+} K^-$  and  $B_{s2}^* \rightarrow B^+ K^-$  signals are observed
- A new smaller structure seen around 20 MeV
- No peaking structures in the  $B^+ K^+$  combinations

# SPECTRUM OF $M(BK) - M(B) - M(K)$ MASS DIFFERENCE

$j_q$	$J^P$	Allowed decay mode	
		$B^+ K^-$	$B^{*+} K^-$
$B_{s0}^*$	$1/2$	$0^+$	yes
$B'_{s1}$	$1/2$	$1^+$	no
$B_{s1}$	$3/2$	$1^+$	no
$B_{s2}^*$	$3/2$	$2^+$	yes

The  $B_{s2}^* \rightarrow B^{*+} K^-$  decay could manifest itself in the  $B^+ K^-$  mass spectrum in a similar fashion to the corresponding  $B_{s1}$  meson decay

- ✓ Distance between the two peaks returns  $m(B^{*+}) - m(B^+)$  (without detecting the photon  $\rightarrow$  smaller systematic uncertainty)
- ✓  $B_{s2}^* \rightarrow BK$  and  $B_{s2}^* \rightarrow B^* K \rightarrow B_{s2}^*$  is a natural state.  $J^P = 2^+$  favored
- ✓ Likely  $(B_{s1}, B_{s2}^*)$  belong to the  $L=1$   $j_q=3/2$  doublet

# FIT RESULTS

Parameter	Fit result	Best previous measurement
$m(B_{s1}) - m(B^{*+}) - m(K^-)$	$10.46 \pm 0.04_{stat} \pm 0.04_{syst}$ MeV/ $c^2$	$10.73 \pm 0.21 \pm 0.14$ MeV/ $c^2$
$m(B_{s2}^*) - m(B^+) - m(K^-)$	$67.06 \pm 0.05_{stat} \pm 0.11_{syst}$ MeV/ $c^2$	$66.96 \pm 0.39 \pm 0.14$ MeV/ $c^2$
$m(B^{*+}) - m(B^+)$	$45.01 \pm 0.30_{stat} \pm 0.23_{syst}$ MeV/ $c^2$	$45.6 \pm 0.8$ MeV/ $c^2$
$\Gamma(B_{s2}^*)$	$1.56 \pm 0.13_{stat} \pm 0.47_{syst}$ MeV/ $c^2$	
$\frac{\mathcal{B}(B_{s2}^* \rightarrow B^{*+} K^-)}{\mathcal{B}(B_{s2}^* \rightarrow B^+ K^+)}$	$(9.3 \pm 1.3_{stat} \pm 1.2_{syst})\%$	
$\frac{\sigma(pp \rightarrow B_{s1} X) \mathcal{B}(B_{s1} \rightarrow B^{*+} K^-)}{\sigma(pp \rightarrow B_{s2}^* X) \mathcal{B}(B_{s2}^* \rightarrow B^+ K^-)}$	$(23.2 \pm 1.4_{stat} \pm 1.3_{syst})\%$	

- Confirmation of the  $B_{s1}$  state
- Most precise measurement of the  $B_{s1}$ ,  $B_{s2}^*$  and  $B^*$  masses
- First observation of the  $B_{s2}^* \rightarrow B^{*+} K^-$  decay (Significance =  $8.\sigma$ )
- First measurement of the  $B_{s2}^*$  natural width

# COMPARISON WITH THEORETICAL PREDICTIONS

$$\Gamma_{B_{s2}^*} = 1.56 \pm 0.13_{\text{stat}} \pm 0.47_{\text{syst}} \text{ MeV}$$

$$\frac{\mathcal{B}(B_{s2}^* \rightarrow B^{*+} K^-)}{\mathcal{B}(B_{s2}^* \rightarrow B^+ K^-)} = (9.3 \pm 1.3_{\text{stat}} \pm 1.2_{\text{syst}})\%$$

Table 1: The strong decay widths of  $B_{s1}$  and  $B_{s2}^*$  in units of MeV.

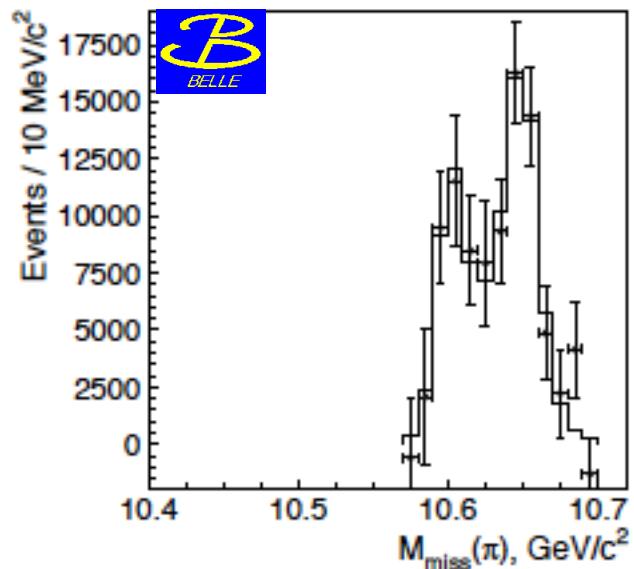

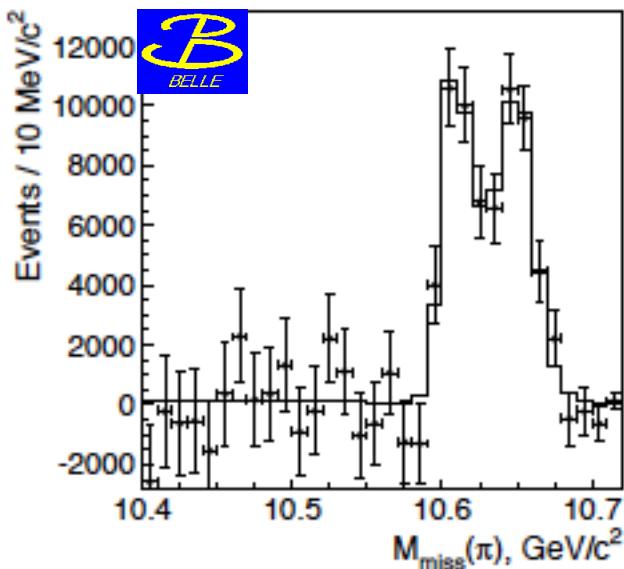

Mode	PLB706(2012)389	PRD43(1991)1679	PRD79(2009)074020	PRD86(2012)054024	PRD78(2008)014029
$B_{s1} \rightarrow B^* \bar{K}$	$0.041 \pm 0.011$	—	0.098	$0.016 \pm 0.002$	$0.4 \sim 1$
$B_{s2}^* \rightarrow B \bar{K}$	$1.55 \pm 0.43$	2.6 (1.9)	4.6	—	2
$B_{s2}^* \rightarrow B^* \bar{K}$	$0.148 \pm 0.084$	0.07 (0.05)	0.4	—	0.12
$B_{s2}^*$				$0.9 \pm 0.1$	

$$\frac{\mathcal{B}(B_{s2}^* \rightarrow B^{*+} K^-)}{\mathcal{B}(B_{s2}^* \rightarrow B^+ K^-)} = 0.070 \pm 0.005$$

# THE $B^{*+}$ MASS MEASUREMENT AND THE $Z_b^{+}$ 'S

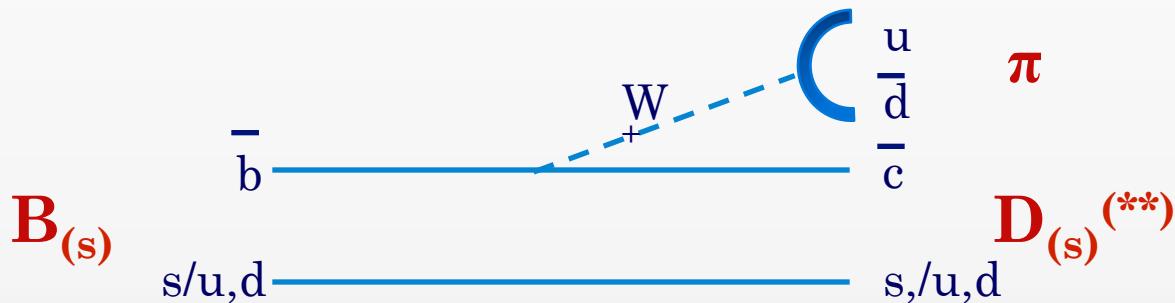

- Observation of charged bottomonium-like  $Z_b(10610)^+$  and  $Z_b(10650)^+$  (**Belle collaboration, PRL 108 (2012) 122001**)
- $B\bar{B}^*$  and  $B^*\bar{B}^*$  molecules? (**A. Bondar et al., PRD84 (2011) 054010**)

Using the  $B^{*+}$  mass measured in this analysis, we compute that the  $Z_b(10610)^+$  and  $Z_b(10650)^+$  masses are  $3.69 \pm 2.05 \text{ MeV}/c^2$  and  $3.68 \pm 1.71 \text{ MeV}/c^2$  above the  $B\bar{B}^*$  and  $B^*\bar{B}^*$  thresholds respectively

# PROSPECTS: EXCITED D<sub>(s)</sub> MESONS

Proliferation of excited charmed states observed in inclusive analyses. Determination of spin parity by amplitude analyses of B decays

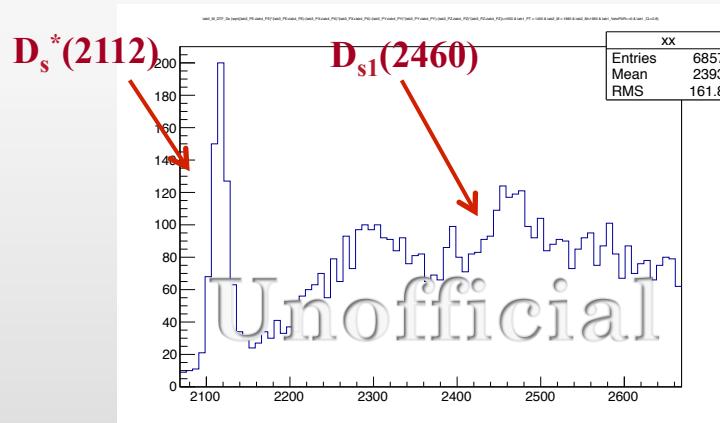

- ✓  $B \rightarrow D\pi\pi$
- ✓  $B_s \rightarrow D\bar{K}\pi$

# PROSPECTS: NATURE OF $D_{s0}^*(2317)$ AND $D_{s1}(2460)$

- Search for new decay modes (likely some  $D_{s1}(2460)$  decay modes are missing)
- Measurements of branching ratios in  $B_s$  decays (same suppression observed in  $B$  decays?)

✓  $B_s \rightarrow D_s \pi^0 \pi^+$   
✓  $B_s \rightarrow D_s \gamma \pi^+$

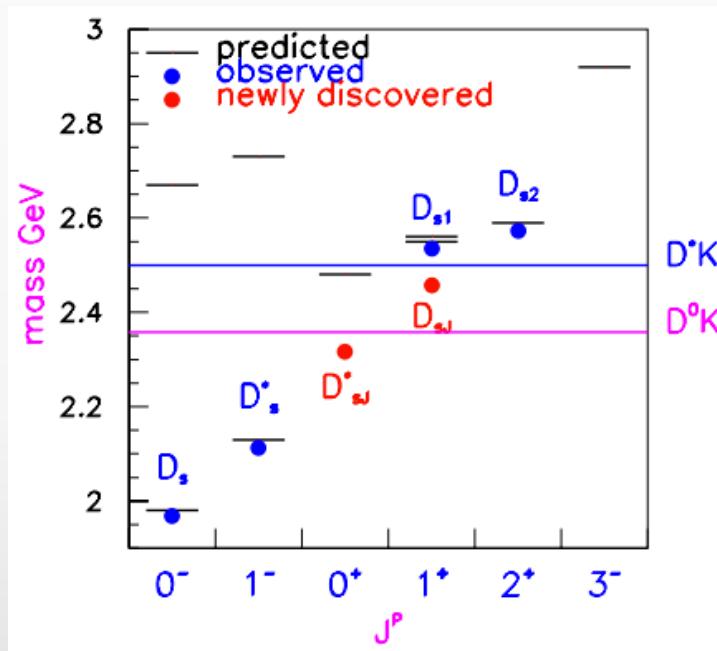

Measurements of the  $D_{s0}^*/D_{s1}'$  production relative to  $D_s^*$  (2112)

If the  $D_{s0}^*/D_{s1}'$  are tetraquarks, the production should be highly suppressed

# PROSPECT: SEARCH FOR $B_{s0}^*$ AND $B_{s1}'$

The  $D_{s0}^*(2317)$  and  $D_{s1}(2460)$  should have “flavour partners”:  $B_{s0}^*$  and  $B_{s1}'$ . Same surprising low masses as  $D_{s0}^*$  and  $D_{s1}$ ?

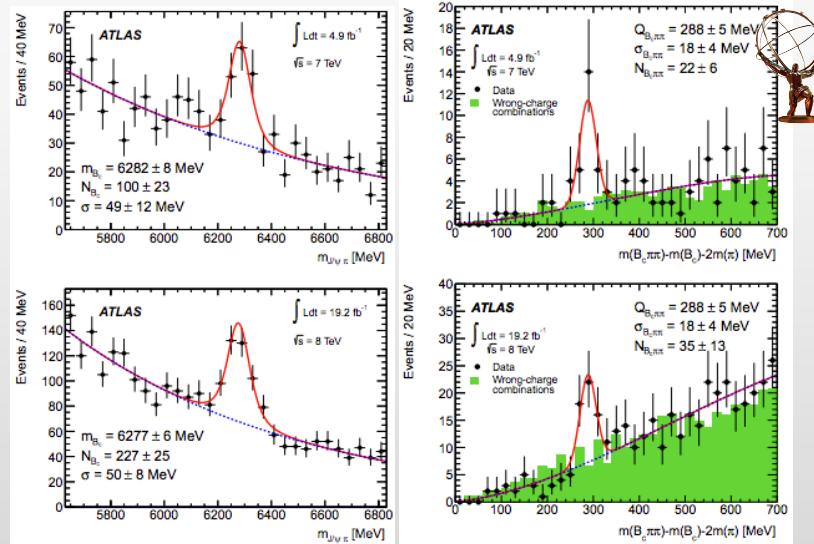

$j_q$	$J^P$	Allowed decay mode		
		$B^+ K^-$	$B^{*+} K^-$	
$B_{s0}^*$	1/2	0 <sup>+</sup>	yes	no
$B'_{s1}$	1/2	1 <sup>+</sup>	no	yes
$B_{s1}$	3/2	1 <sup>+</sup>	no	yes
$B_{s2}^*$	3/2	2 <sup>+</sup>	yes	yes

Broad structures are observed n B<sub>n</sub>. BK? B<sup>0</sup>K<sup>0</sup><sub>S</sub>?

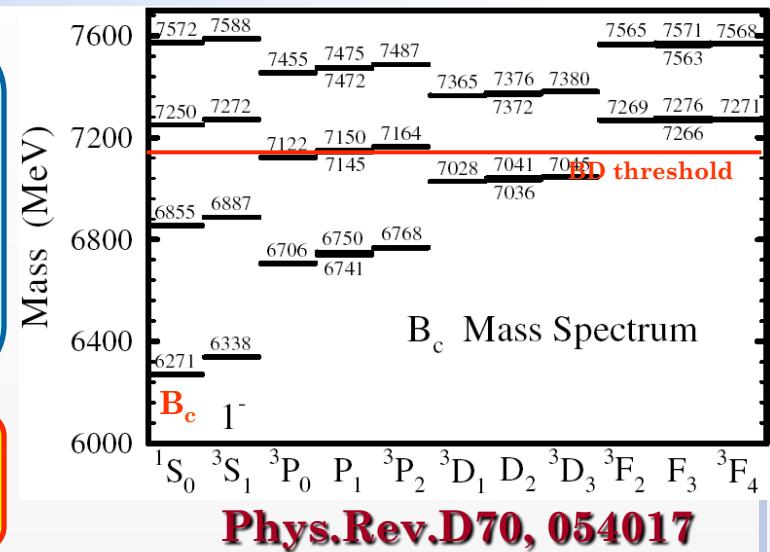

# PROSPECT: EXCITED $B_c$

- $B_c$  is the only meson in SM formed by two different heavy flavour quarks
- Many excited states predicted below the BD threshold
- $B_c^{**} \rightarrow B_c + X$  where  $X = \gamma, \pi^+\pi^-, \dots$

Recently ATLAS found a peak in the  $B_c \pi^+\pi^-$  mass spectrum identified as  $B_c(2S)$

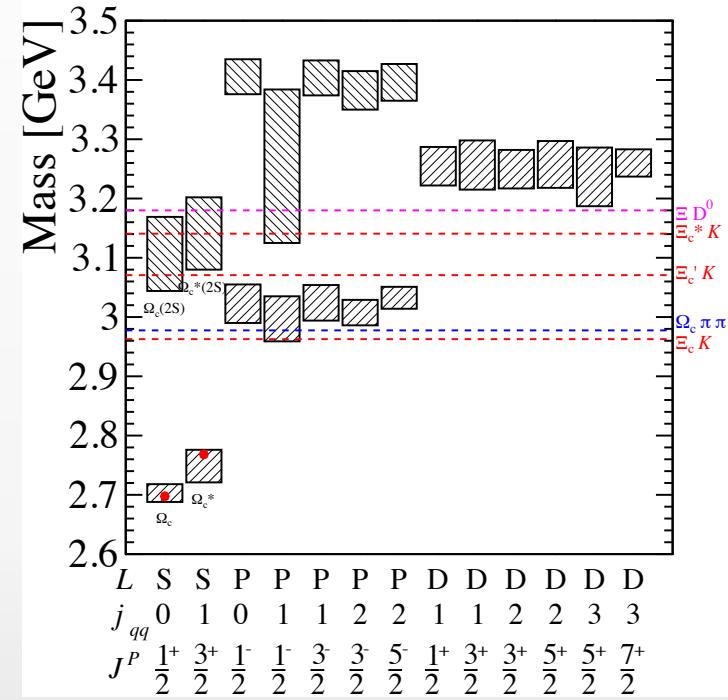

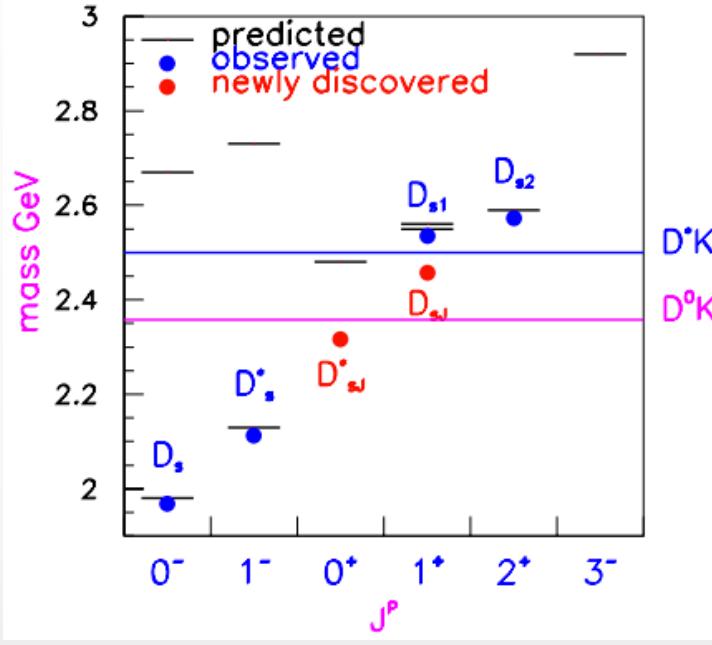

[ATLAS, arXiv:1407.1032]

$M = 6842 \pm 4 \pm 5 \text{ MeV}$   
 $\Gamma \ll \text{resolution}$

- Large relative yield  $N(B_c(2S))/N(B_c)$
- What about the the  $B_c^*(2S) \rightarrow B_c^*\pi\pi$ ?  
 $(\sigma(B_c^*(2S))/\sigma(B_c(2S))=3)$

# PROSPECT: $\Omega_c$ SPECTROSCOPY

Some surprising low mass  $\Omega_c^{**}$  states?

# SUMMARY

- LHCb is very active into studying excited heavy mesons
  - Inclusively: New states, new decay modes
  - Exclusively: New states, determination of quantum numbers
- Properties of  $B_{s1}$  and  $B_{s2}^*$  states well predicted (as it was for  $D_{s1}$  and  $D_{s2}^*$ )
- Further studies of  $B_{(s)}^{**}$  states from decays are unlikely until we collect a large sample of  $B_c$ 's
- Search for the missing  $B_{s0}^*$  and  $B_{s1}'$  states. Same surprising low masses as  $D_{s0}^*$  and  $D_{s1}'$ ?
- Investigation of the nature of  $D_{s0}^*$  and  $D_{s1}'$  states: production studies, search for new decays modes, measurements of BR's from  $B_s$  decays...
- Decays with neutral as decay products could be investigated

- ✓ Spectroscopy will play a more important role in the near future
- ✓ RUN I data not fully exploited so far. Many systems still unexplored...
- ✓ ...and RUN II is ahead (expected 5-10  $\text{fb}^{-1}$ )

# SELECTION OF THE $B\pi$ CANDIDATES

[LHCb-PAPER-2014-067; arXiv:1502.02638]

- $B^+(B^0)$  candidates, within a  $\pm 25(50)$  MeV mass region, combined with  $\pi^-(\pi^+)$
- The wrong sign (WS) combinations  $B^+\pi^+$  and  $B^0\pi^-$  are also selected for background studies
- $B^+\pi^-$  candidates refitted with
  - ✓ Primary vertex constraint (i.e.  $B$  and  $\pi$  are forced to originate from the primary vertex)
  - ✓  $B^+$  and  $J/\psi/D^0/D^-$  mass constraints

- Selection tuning of companion pions:
  - ✓  $p_T > 0.5$  GeV (suppression of combinatorial background)
  - ✓ PID requirements (suppression of misidentified decays: e.g.  $B_s^{**} \rightarrow BK$  where  $K \not\sim \pi$ )
  - ✓ Small IP relative to the PV associated to the  $B$  candidates
- Selection tuning of the  $B$  candidates:
  - ✓  $B^0$  decay time  $< 0.2$  ps (suppression of peaking signals in the WS due to the oscillations of the  $B^0$ 's)
