WHAT IS THE CMDB ?

The configuration management database (CMDB) as conceptual IT model which reflects the infrastructure and service structural configuration (anatomy of the service).

- **CMDB** is containing the characteristics of each *configuration item* (CI) of an IT infrastructure and the relationships between the items.
- The **relationships** between the CIs can be any (important) logical expression which involved two CIs, evaluates to true and reflects a structural information.
- CMDB content is under the control of Configuration Management process

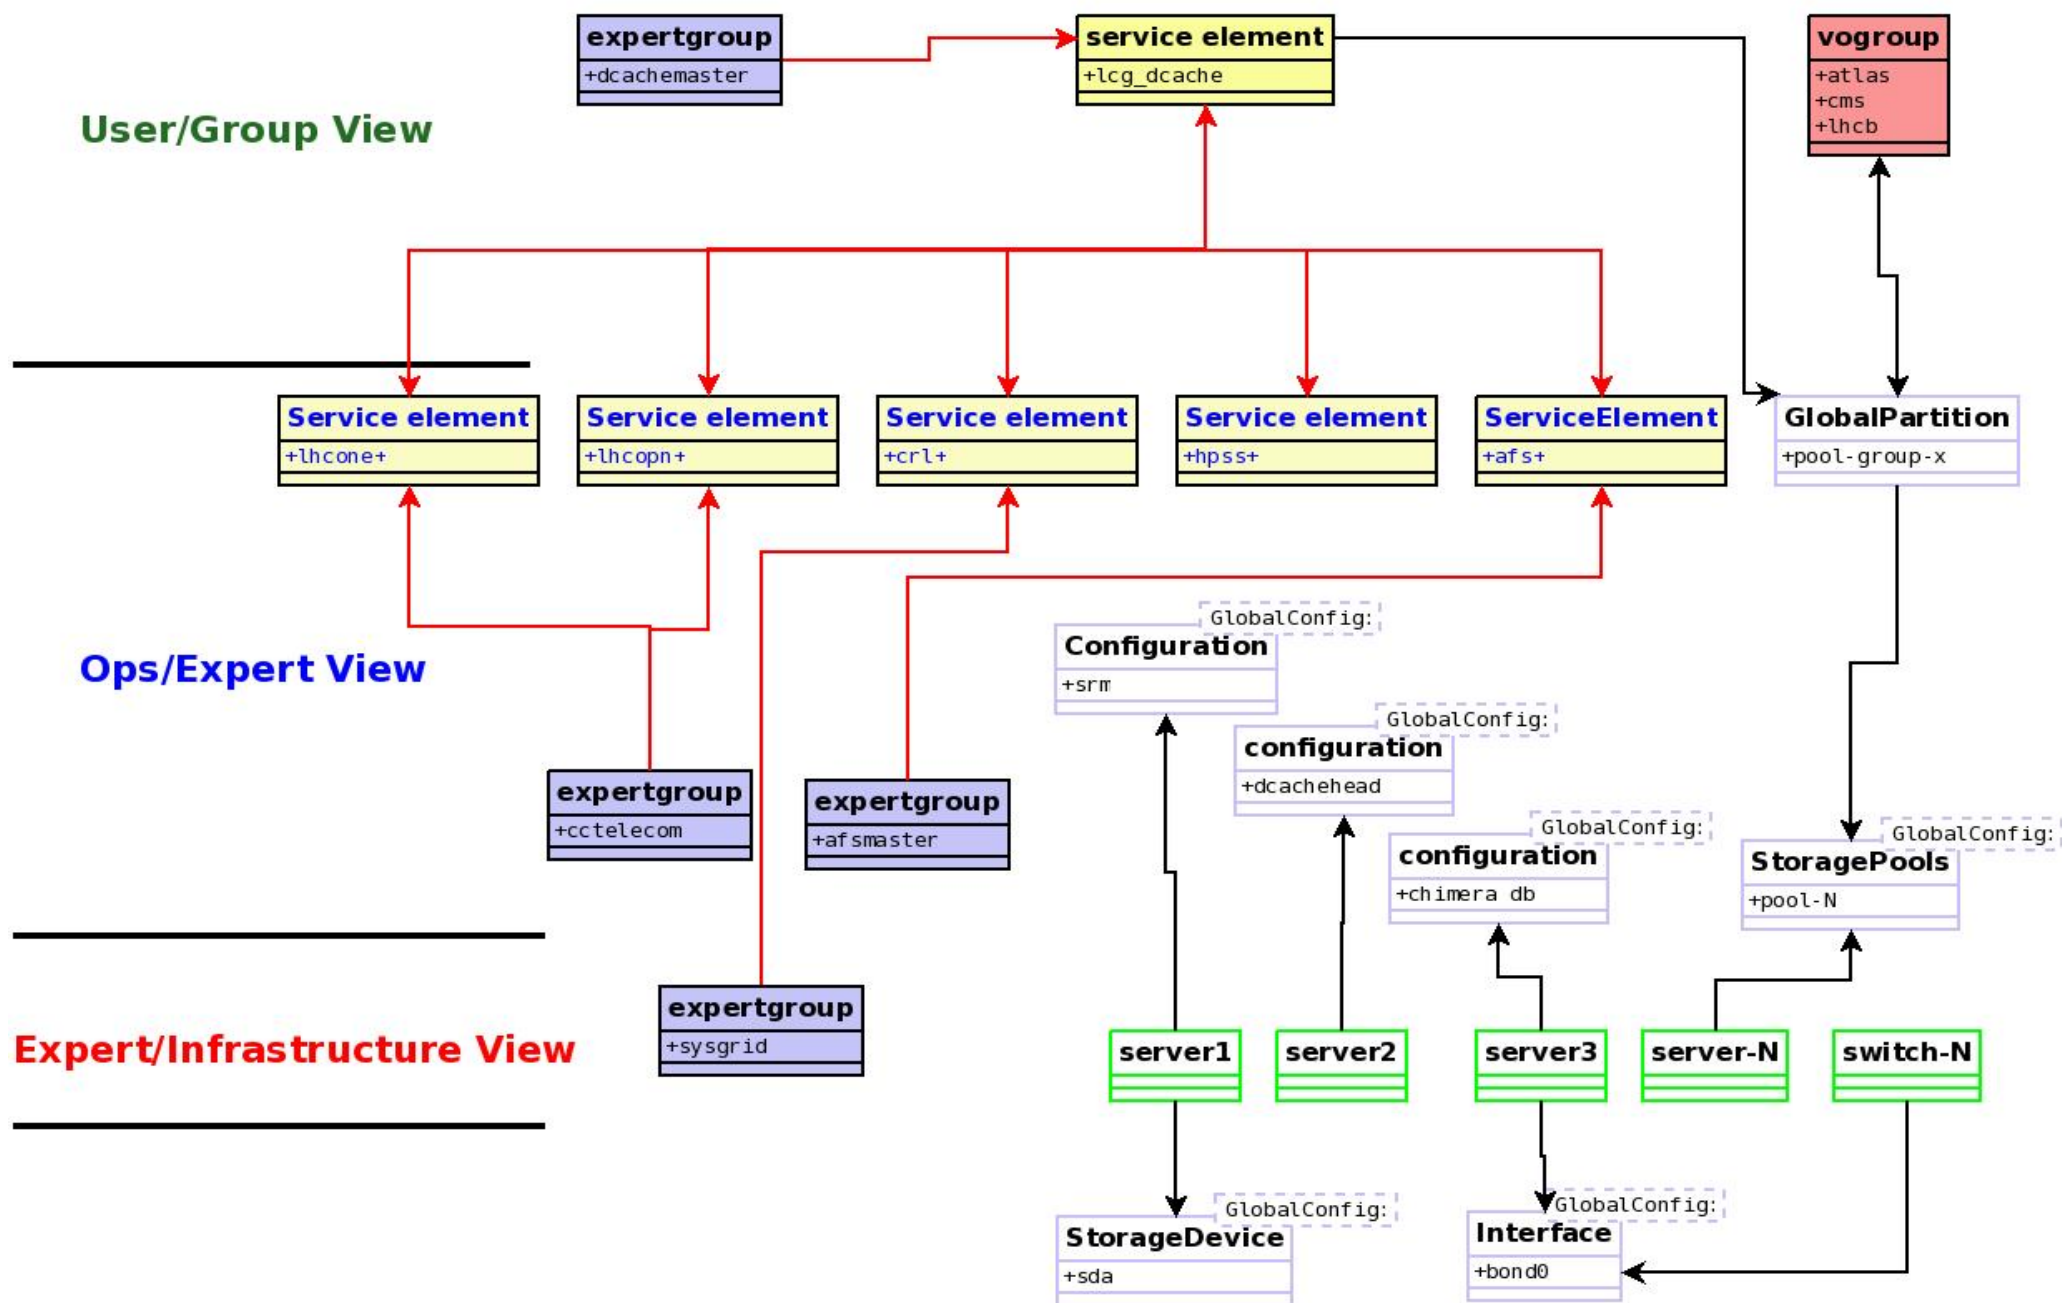

A Configuration Item could be :

- **Hardware components**
 - **Server**
 - **Box of Discs**
- **Storage Systems**
 - **NAS/NFS/GPFS**
 - **SAN**
- **Network Switch/Routers**
- **Distributed Systems**
 - **HA database cluster**
 - **HA webCluster**
- **A Technical Services**
 - **batch system,**
 - **auth system**
 - **Grid Service Element**
- **Logical Service :**
 - **LHCone/LHCopn**
- **Documentation**
- **Technology provider/Supplier**

ITSM Model : dCache example

- **Provide the service structure blue print (CI + R)**
 - Define the context of the CIs
 - Define the level of granularity
- **Collect the information (CIs + R) and populate the CMDB**
- **Control the Change of the Information (Manual vs Auto)**
 - Track the Changes and Updates
 - Keep History
- **Audits and Feedback**
 - Validation of the information sources
 - State of the data (Stored data in CMDB vs Real Data)
 - Define metrics about the state of repository and the data collection process (KPIs)
- **Supply information to other processes**
 - **Atomic (current state)**
 - **Reports (on changes)**

- ~ 2000 of servers on prod, Now
- ~ 60 VM in Service OpenStack
- ~ 132 different tags usage in SysUnix DB
- ~> 50 Service Element

- ~ 836 Wns (3 generation of servers)
- ~ 200 of storage server (dcache,xroot)
- ~ 17 vbox in prod

cluster databases
(3 DB technologies:Oracle,MySQL,
Postgresql)

~4 a number of SAN/NAS

- ~270 Network Switches
- + Power zones
- + cooling zones
- 2 computer Rooms

Functional Model

- **User/Group**
- **Operations Team/Support Team**
- **Service/Middleware Experts**
- **SysAdmin**
- **Network**
- **Infrastructure Team**

share vertical information
Between the Functional Group
about the user-service-systems

Targets and Goals of our project

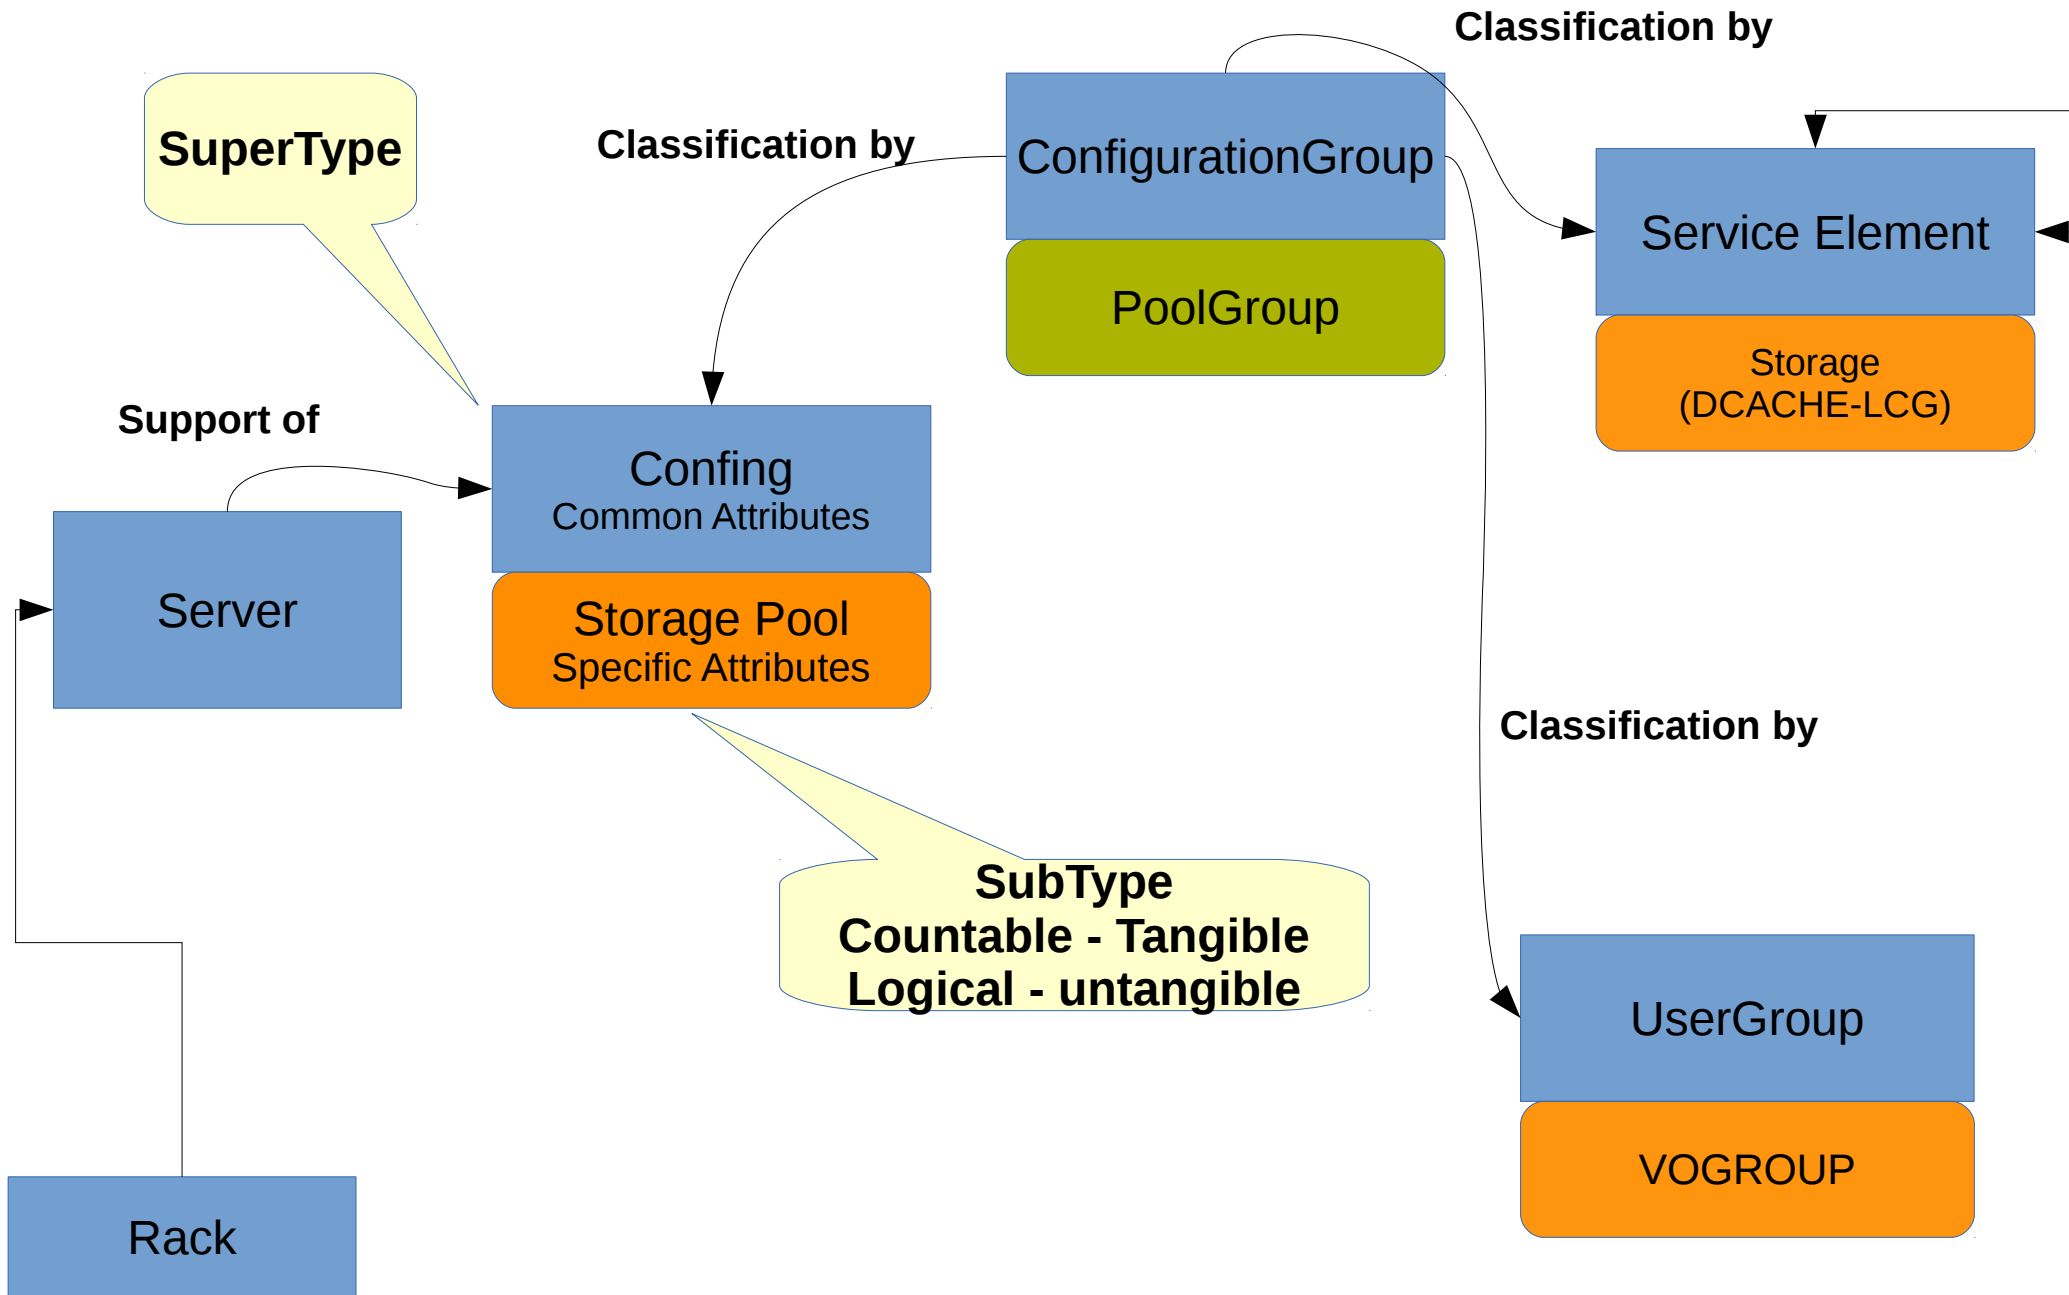

Provide a single repository of information and data exchange in order to support ITIL Processes

- **Organize existing information in different views in the framework of a CMDB conceptual model: ITSM blue print model**
- **Build common model with well define dictionaries and objects (CI): Common language and dictionary of the "services" description**
- **Identify easy a server from a service and from user-group usage (and reverse): Impact analysis**
- **Join logistics information – support Capacity Planning**
- **Establish the self Maintenance Process**

Define the foundation for a change management system

Data Model

- Scheme with details
- Meet the standard type of the classification scheme
- Description of the Service Element (Technical Service)
- Easy adaptation (e.g. supertypes)
- Covers well the distributed system structure (e.g. storage, batch, load balance, ..., etc)
- Scheme too complex for "atomic services" (e.g. vobox)

Details

• Current Status

- Data Model
- Identify Sources
- CMDBuild low level connector
- CMDBuild - Lavoisier collector
 - Service Family
 - Auto population
- Pre-prod test instance

• Further Steps

- Revision of data model
 - auto vs manual class
- Validations of Lavoisier connector with high number of CIs
- Key Performance Indicator (Process)
- Validation of sources
- Include more services

Define the Life Circle of a IT service

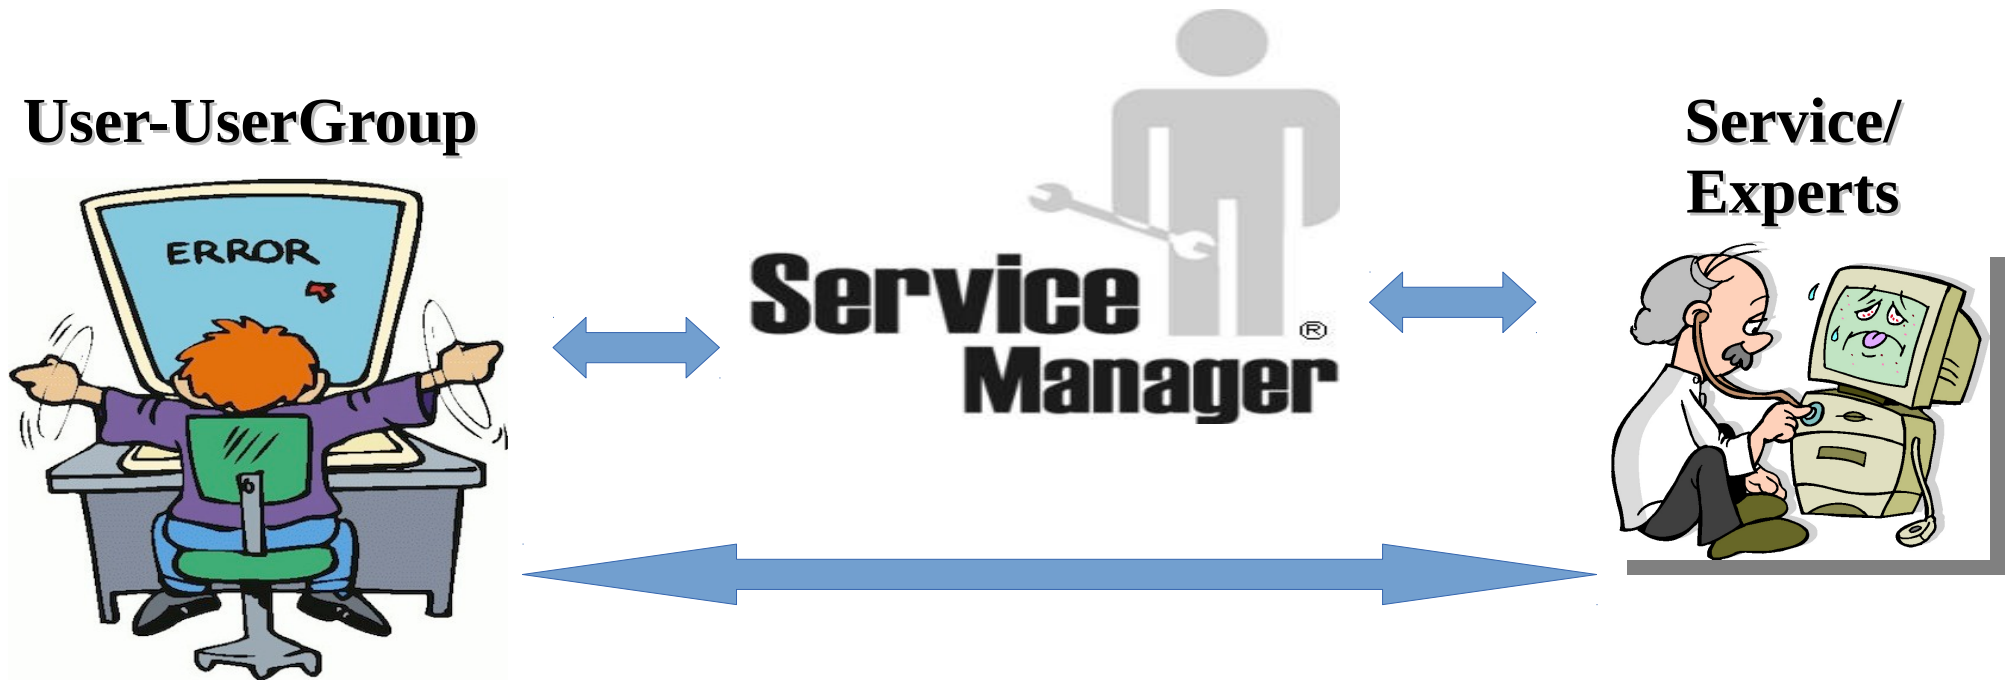

ITIL Process

- **The description of the process should be defined**
- **But it is not 100 % necessary the process to be automatic and based on specific tools**

Stakeholder Boundaries

- *Represents all provided services to a User / Group and is responsible for all Service*
- *Support and Service Delivery actions taken to ensure they meet User / Group needs and IT Requirements (performance, capacity, availability of the service).*
- *Responsible for overall USER / GROUP Satisfaction.*

ITIL PROCESS
