# Physics overview and motivation

Two main goals of Standard Model (SM) measurements in ATLAS are: to test theory with high precision and to find any signs of new physics.

mass → charge → spin →	$\approx 2.3 \text{ MeV}/c^2$ 2/3 1/2 <b>u</b> up	$\approx 1.275 \text{ GeV}/c^2$ 2/3 1/2 <b>c</b> charm	$\approx 173.07 \text{ GeV}/c^2$ 2/3 1/2 <b>t</b> top	0 1 0 <b>g</b> gluon	$\approx 126 \text{ GeV}/c^2$ 0 0 <b>H</b> Higgs boson

Study of  $Z\gamma$  and  $Z\gamma\gamma$  production probes EW sector via interactions between two types of neutral bosons.

## SM diagrams

Initial state radiation (ISR)

Final state radiation (FSR)

**Z $\gamma\gamma$ :** 2 ISR / 2 FSR / 1 ISR and 1 FSR photons in diagrams

- New physics can be probed **indirectly** via study of interactions between EW gauge bosons.
- SM **doesn't predict** any neutral triple or quartic vertex at tree level.
- Anomalous triple or quartic gauge couplings (aTGCs and aQGCs) can occur only due to physics beyond Standard Model.
- **ATGC/AQGC modify total cross sections and kinematics.**

## aGC diagrams:

# Events signatures

- $Z\gamma$  events

- $ll\gamma$  has signature of two good identified leptons (e or  $\mu$ ) and one isolated photon
- $\nu\nu\gamma$  has signature of high missing transverse momentum and one isolated photon

$ll\gamma$ :  $p_T(l) > 25$  GeV;  $E_T(\gamma) > 15$  GeV

$\nu\nu\gamma$ :  $E_T(\text{miss}) > 100$  GeV;  $E_T(\gamma) > 130$  GeV

- $Z\gamma\gamma$  events signatures differ from  $Z\gamma$  by presence of one more isolated photon

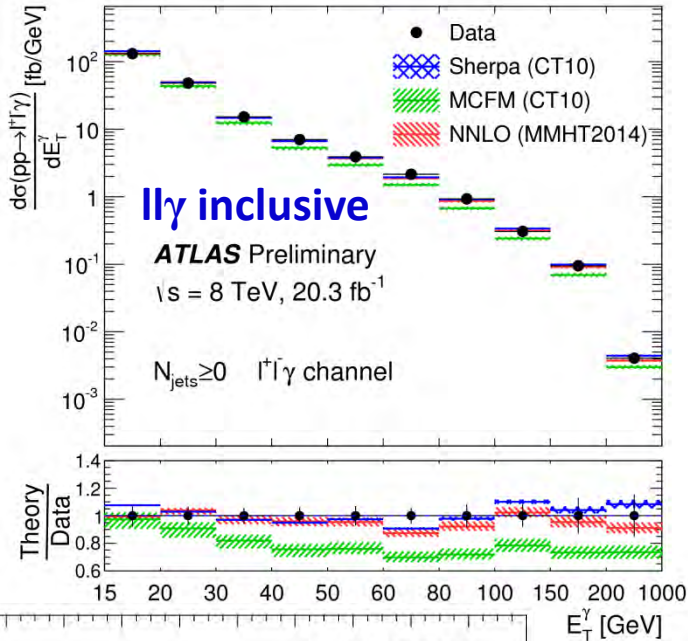

$ll\gamma\gamma$ :  $p_T(l) > 25$  GeV;  $E_T(\gamma) > 15$  GeV  
 $\nu\nu\gamma\gamma$ :  $E_T(\text{miss}) > 110$  GeV;  $E_T(\gamma) > 22$  GeV

*Inclusive selection: without and constraints on hadronic activity; Exclusive selection:  $N_{jets} = 0$*

# Cross sections measurement for $Z\gamma$

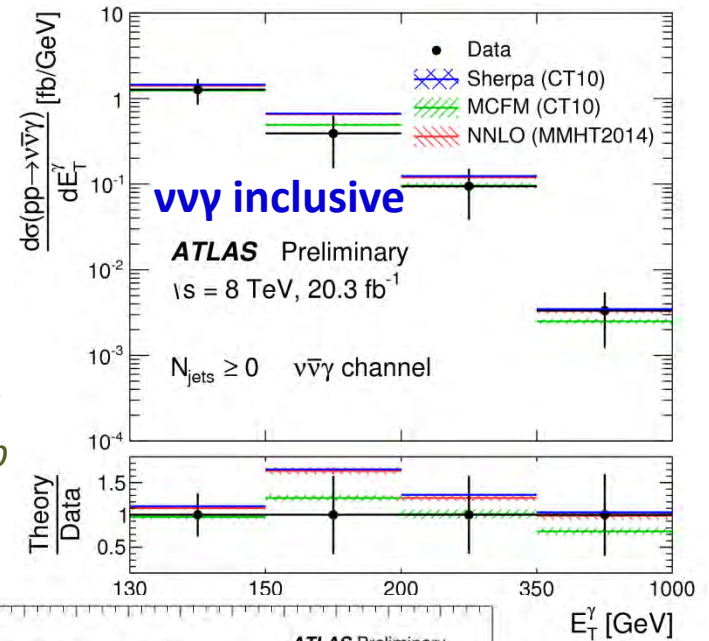

$l\bar{l}\gamma$  channels have 1 data-driven background  $Z$ +jets, which is dominant and estimated using 2D sideband.

$\nu\nu\gamma$  channel has several data-driven backgrounds:  $\gamma$ +jets,  $W(l\nu/\tau\nu)+\gamma$ ,  $W(e\nu)$  and  $Z$ +jets, which are estimated either by CRs constructions or by 2D sideband.

*Differential measurement*  
 $E_T(\gamma)$  distribution

$m[Z\gamma]$  and  $N_{\text{jets}}$  differential distributions for  $l\bar{l}\gamma$  are in back-up (sl. 24-25)

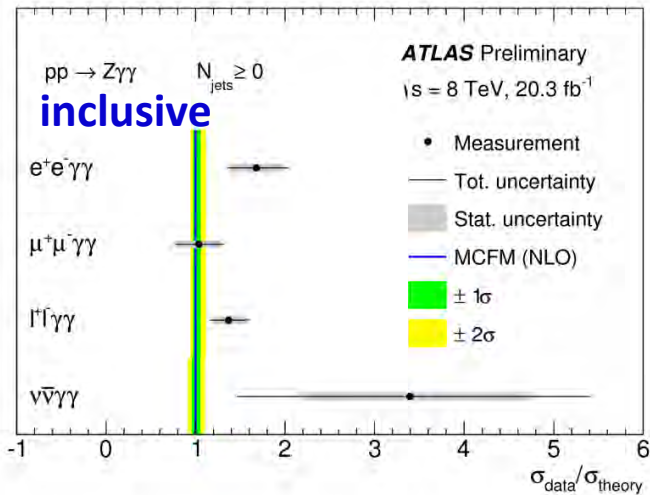

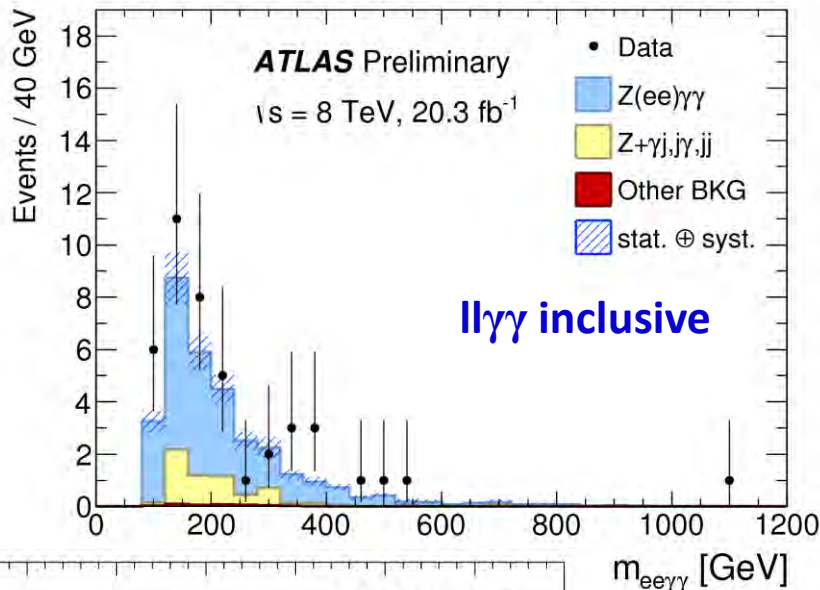

*Integrated measurement*

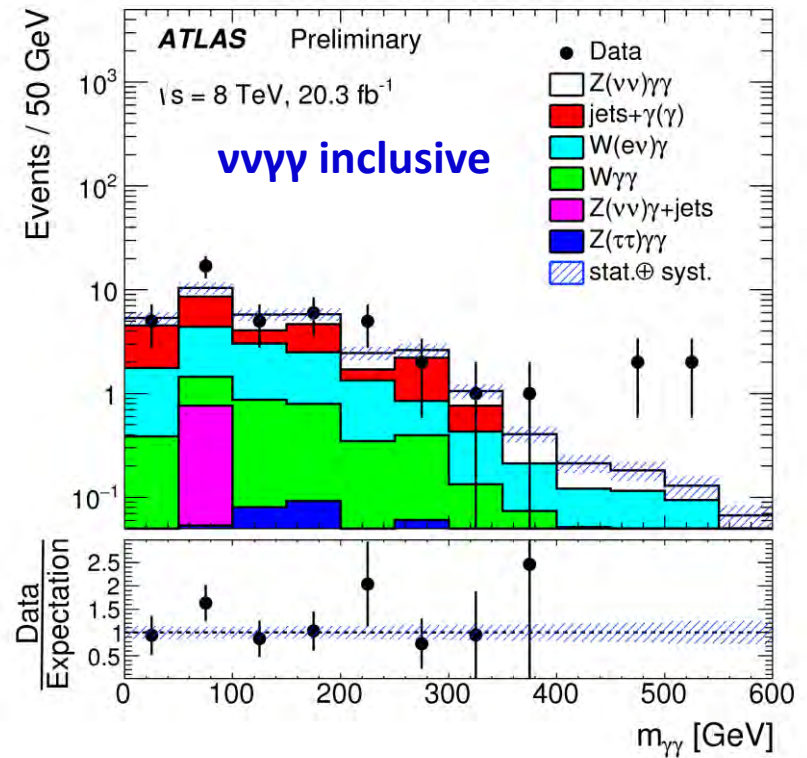

Agrees well with SM within uncertainties

# Observation for $Z\gamma\gamma$

$l\gamma\gamma$  channels have 1 data-driven background  $Z+\text{jets}/\gamma\text{jets}$ , which is dominant and estimated using matrix CRs method.

$\nu\nu\gamma\gamma$  channel has several data-driven backgrounds:  $\gamma+\text{jets}$ ,  $W(l\nu/\tau\nu)+\gamma\gamma$  and  $W(e\nu)\gamma$ , which are estimated either by CRs constructions or by 2D sidebands.

The shapes agree well for  $l\gamma\gamma$  and fairly well for  $\nu\nu\gamma\gamma$  between  $Z\gamma\gamma$  data candidates and the expectations within uncertainties

Significance for  $l\gamma\gamma$  combination is more than 5 sigma.

# Limits on Anomalous Gauge Couplings: Distributions

$E_T(\gamma)$  distributions are used for aTGC limit setting

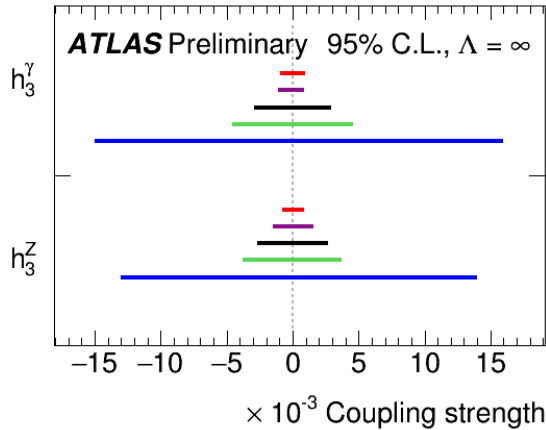

$m_{\gamma\gamma}$  distributions are used for aQGC limit setting

# Limits on Anomalous Gauge Couplings: Results

- ATLAS,  $l\gamma$  and  $\nu\nu\gamma$ ,  $\sqrt{s}=8$  TeV,  $20.3 \text{ fb}^{-1}$
- CMS,  $\nu\nu\gamma$ ,  $\sqrt{s}=8$  TeV,  $19.6 \text{ fb}^{-1}$
- CMS,  $l\gamma$  and  $\nu\nu\gamma$ ,  $\sqrt{s}=7$  TeV,  $5.0 \text{ fb}^{-1}$
- CMS,  $l\gamma$ ,  $\sqrt{s}=8$  TeV,  $19.5 \text{ fb}^{-1}$
- ATLAS,  $l\gamma$  and  $\nu\nu\gamma$ ,  $\sqrt{s}=7$  TeV,  $4.6 \text{ fb}^{-1}$

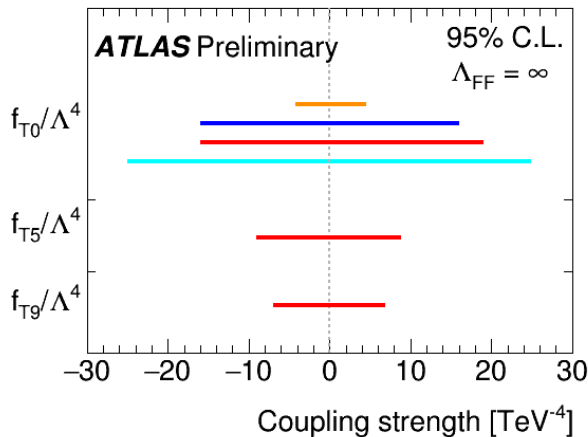

**aTGC**  
Vertex function approach

Best limits obtained!

- ATLAS,  $l\gamma$  and  $\nu\nu\gamma$ ,  $\sqrt{s}=8$  TeV,  $20.3 \text{ fb}^{-1}$
- CMS,  $\nu\nu\gamma$ ,  $\sqrt{s}=8$  TeV,  $19.6 \text{ fb}^{-1}$
- CMS,  $l\gamma$  and  $\nu\nu\gamma$ ,  $\sqrt{s}=7$  TeV,  $5.0 \text{ fb}^{-1}$
- CMS,  $l\gamma$ ,  $\sqrt{s}=8$  TeV,  $19.5 \text{ fb}^{-1}$
- ATLAS,  $l\gamma$  and  $\nu\nu\gamma$ ,  $\sqrt{s}=7$  TeV,  $4.6 \text{ fb}^{-1}$

- $W^\pm W^\pm$  CMS,  $\sqrt{s}=8$  TeV,  $19.4 \text{ fb}^{-1}$
- $W\gamma\gamma$  ATLAS,  $\sqrt{s}=8$  TeV,  $20.3 \text{ fb}^{-1}$
- $Z\gamma\gamma$  ATLAS,  $\sqrt{s}=8$  TeV,  $20.3 \text{ fb}^{-1}$
- $WV\gamma$  CMS,  $\sqrt{s}=8$  TeV,  $19.3 \text{ fb}^{-1}$

**aQGC**  
EFT approach

Limits for  $f_{t5}$  and  $f_{t9}$  were obtained first time in ATLAS!

- $\gamma\gamma \rightarrow WW$  CMS,  $\sqrt{s}=7$  TeV,  $5.05 \text{ fb}^{-1}$
- $WV\gamma$  CMS,  $\sqrt{s}=8$  TeV,  $19.3 \text{ fb}^{-1}$
- $W\gamma\gamma$  ATLAS,  $\sqrt{s}=8$  TeV,  $20.3 \text{ fb}^{-1}$
- $Z\gamma\gamma$  ATLAS,  $\sqrt{s}=8$  TeV,  $20.3 \text{ fb}^{-1}$

No sign of deviation from SM predictions

# Conclusions

## ➤ $Z\gamma$ analysis

- Precise measurement of the integrated and differential cross sections for  $l\bar{l}\gamma$  and  $\nu\bar{\nu}\gamma$  final states. Good agreement for most channels
- Comparison of the measured cross sections with NLO and NNLO predictions

## ➤ $Z\gamma\gamma$ analysis

- First measurement of  $l\bar{l}\gamma\gamma$  and  $\nu\bar{\nu}\gamma\gamma$  final states cross sections in ATLAS
- Good agreement of integrated  $Z\gamma\gamma$  cross sections with theory predictions (deviations of the integrated observed cross section from SM one for all of the channels are less than  $2\sigma$ )

## ➤ aGC limit setting

- **No sign of deviation from SM predictions**
- Limits on aTGC parameters accessible with this final state are better than all other results
- aQGC limits are comparable to those obtained from other measurements in ATLAS and CMS. Limits for  $ft5/\Lambda^4$  and  $ft9/\Lambda^4$  obtained for the first time in ATLAS

## **Back-up slides**

# Event selection

- $ll\gamma$  and  $ll\gamma\gamma$ :

Exactly 2 selected leptons  $\{p_T > 25 \text{ GeV}, |\eta| < 2.5\}$ ,  $m[l^+l^-] > 40 \text{ GeV}$

$ll\gamma$ :  $\geq 1$  photons  $\{E_T > 15 \text{ GeV}, |\eta| < 2.37\}$ , take the photon with highest  $E_T$

$ll\gamma\gamma$ :  $\geq 2$  photons  $\{E_T > 15 \text{ GeV}, |\eta| < 2.37\}$  with  $\Delta R(\gamma, \gamma) > 0.4$ . If  $> 2$  photons, take two with highest sum of  $E_T$

- $\nu\nu\gamma$  and  $\nu\nu\gamma\gamma$

lepton-veto

- To suppress  $W (\rightarrow l\nu/\tau\nu)\gamma$  background in  $\nu\nu\gamma$  channel and  $W (\rightarrow l\nu/\tau\nu)\gamma\gamma$  background in  $\nu\nu\gamma\gamma$  channel

$E_T(\text{miss}) > 100$  ( $\nu\nu\gamma$ ),  $110$  ( $\nu\nu\gamma\gamma$ ) GeV

- To suppress  $\gamma$ +jets background

$\nu\nu\gamma$ :  $\geq 1$  photons  $\{E_T > 130 \text{ GeV}, |\eta| < 2.37\}$ , take the photon with highest  $E_T$

$\nu\nu\gamma\gamma$ :  $\geq 2$  photons  $\{E_T > 22 \text{ GeV}, |\eta| < 2.37\}$  with  $\Delta R(\gamma, \gamma) > 0.4$ . If  $> 2$  photons, take two with highest sum of  $E_T$

$\nu\nu\gamma$ :  $\gamma$  and  $p_T(\text{miss})$  back-to-back :  $|\Delta\phi(p_T(\text{miss}), \gamma)| \geq \pi/2$

$\nu\nu\gamma\gamma$ :  $\gamma\gamma$  system and  $p_T(\text{miss})$  back-to-back :  $|\Delta\phi(p_T(\text{miss}), \gamma\gamma)| \geq 5\pi/6$

- To suppress  $\gamma$ +jets and  $W(\rightarrow e\nu)(\gamma)$  backgrounds

Inclusive selection: without and constraints on hadronic activity

Exclusive selection:  $N_{jets} = 0$   $\{p_T(\text{jet}) > 30 \text{ GeV}, |\eta(\text{jet})| < 4.5\}$

# Background estimation in $l\bar{l}\gamma$ and $l\bar{l}\gamma\gamma$

## $l\bar{l}\gamma$ channel backgrounds:

$Z(\rightarrow l\bar{l})+jets$  {where jet is misidentified as  $\gamma$ } is estimated using two-dimensional side-band method (data-driven):

Using two independent discriminating variables (*photon isolation and photon shower shapes in the first EM layer*) to define four regions A/B/C/D, background in the signal region A can be easily obtained.

$$\frac{N_A^{Z+jets}}{N_B} = \frac{N_C}{N_D}$$

$t\bar{t}\gamma$ ,  $\tau^+\tau^-\gamma$  and  $WZ$  are estimated from MC simulation.

Inclusive/Exclusive

## $l\bar{l}\gamma\gamma$ channel backgrounds:

$Z(\rightarrow l\bar{l})+jets/\gamma jets$  is estimated using matrix method (data-driven):

$$\begin{pmatrix} N_{TT} \\ N_{TL} \\ N_{LT} \\ N_{LL} \end{pmatrix} = \begin{pmatrix} \epsilon_1 \epsilon_2 & \epsilon_1 f_2 & f_1 \epsilon_2 & f_1 f_2 \\ \epsilon_1 (1 - \epsilon_2) & \epsilon_1 (1 - f_2) & f_1 (1 - \epsilon_2) & f_1 (1 - f_2) \\ (1 - \epsilon_1) \epsilon_2 & (1 - \epsilon_1) f_2 & (1 - f_1) \epsilon_2 & (1 - f_1) f_2 \\ (1 - \epsilon_1)(1 - \epsilon_2) & (1 - \epsilon_1)(1 - f_2) & (1 - f_1)(1 - \epsilon_2) & (1 - f_1)(1 - f_2) \end{pmatrix} \begin{pmatrix} N_{\gamma\gamma} \\ N_{\gamma jet} \\ N_{jet\gamma} \\ N_{jet,jet} \end{pmatrix}$$

T/L – tight/loose photon

$\epsilon$  - signal efficiency

$f$  - fake rate

$$N_{TT}^{j \rightarrow \gamma} = \epsilon_1 f_2 \times N_{\gamma jet} + f_1 \epsilon_2 \times N_{jet\gamma} + f_1 f_2 \times N_{jet,jet}$$

$\tau^+\tau^-\gamma\gamma$ ,  $ZZ$  and  $WZ$  are estimated from MC simulation.

Inclusive

Exclusive

# Kinematic distributions for $l\bar{l}\gamma$

*Photon transverse momentum spectra for inclusive selection*

The shapes agree very well between  $Z\gamma$  data candidates and the expectations

# Kinematic distributions for $l\bar{l}\gamma$

*Photon transverse momentum spectra for exclusive selection*

# Kinematic distributions for $l\bar{l}\gamma\gamma$

$m[l\bar{l}\gamma\gamma]$  and  $m[\gamma\gamma]$  spectra for inclusive selection

# Kinematic distributions for $l\bar{l}\gamma\gamma$

$m[l\bar{l}\gamma\gamma]$  and  $m[\gamma\gamma]$  spectra for exclusive selection

# Background estimation in $\nu\nu\gamma$ and $\nu\nu\gamma\gamma$

## $\nu\nu\gamma$ channel backgrounds:

$\gamma$ +jets {fake  $E_T(\text{miss})$ } is estimated using CR region  $|\Delta\phi(p_T(\text{miss}), \gamma)| < \pi/2$ ;  
 $W(\rightarrow l\nu/\tau\nu)\gamma$  – from CR region with  $\geq 1$  lepton  $\{e/\mu\}$  (normalization, shape from MC);  
 $W(\rightarrow e\nu)$  {e misidentified as  $\gamma$ } – from CR with selecting a electron instead of photon, normalization from  $e\rightarrow\gamma$  fake rate, obtained using  $Z(ee)$  events;  
 $Z(\rightarrow ll)$ +jets is estimated using two-dimensional side-band method (as for  $ll\gamma$ );  
 $\tau^+\tau^-\gamma$  is estimated from MC simulation.

## $\nu\nu\gamma\gamma$ channel backgrounds:

$jets+\gamma(\gamma)$  is estimated using two-dimensional sideband method with  $E_T(\text{miss})$  and photon shower shapes in the first EM layer as the two discriminants.

$W(\rightarrow l\nu/\tau\nu)\gamma\gamma$ ,  $W(\rightarrow e\nu)\gamma$ ,  $\tau^+\tau^-\gamma\gamma$  – estimated using the same methods as for  $\nu\nu\gamma$  analogs.

# Kinematic distributions for $\nu\nu\gamma$

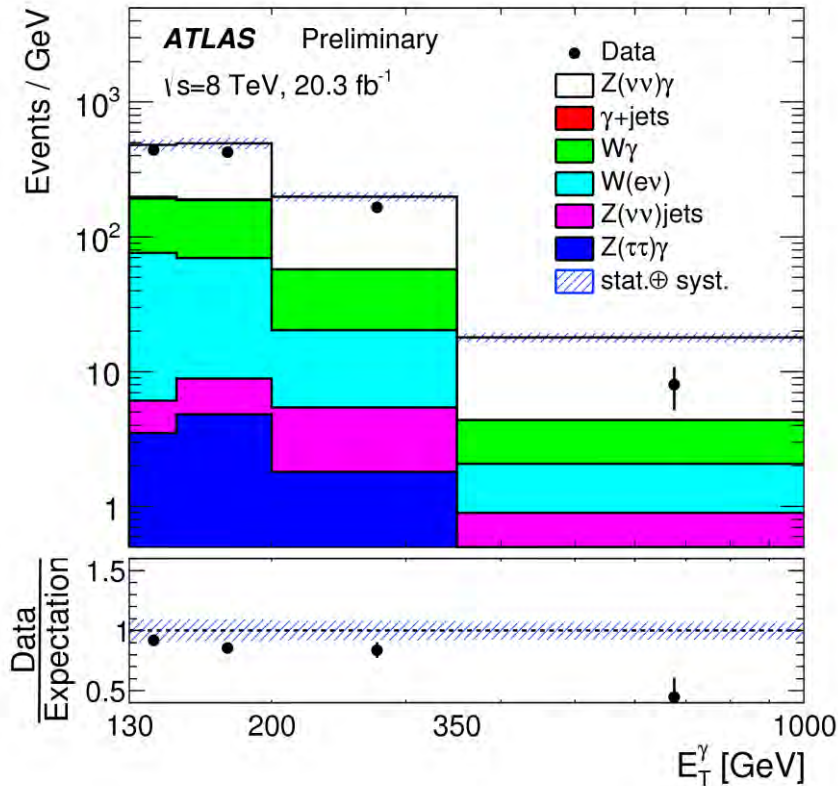

*Photon transverse momentum and missing  $E_T$  spectra for inclusive selection*

The shapes agree between  $Z\gamma$  data candidates and the expectations within uncertainties for most of the bins

# Kinematic distributions for $\nu\nu\gamma$

*Photon transverse momentum and missing  $E_T$  spectra for exclusive selection*

# Kinematic distributions for $\nu\nu\gamma\gamma$

$m[\gamma\gamma]$  and missing  $E_T$  spectra for inclusive selection

The shapes agree fairly well between  $Z\gamma\gamma$  data candidates and the expectations within uncertainties

# Kinematic distributions for $\nu\nu\gamma\gamma$

$m[\gamma\gamma]$  and missing  $E_T$  spectra for exclusive selection

# Cross-sections

B – estimated backgrounds

$$\sigma_{\text{ext-fid}} = \frac{N - B}{A \cdot C \cdot \int L dt}$$

A&C – factors to correct for detection efficiency and acceptance

# Differential cross-sections for $l\bar{l}\gamma$

*Unfolded photon transverse momentum spectra for inclusive and exclusive selection*

Comparison to Sherpa, MCFM and MMHT (NNLO)

Good agreement with Sherpa and MMHT NNLO for most of bins, bad agreement with MCFM NLO predictions for inclusive measurement.

# Differential cross-sections for $v\bar{v}\gamma$

*Unfolded photon transverse momentum spectra for inclusive and exclusive selection*

Comparison to Sherpa, MCFM and MMHT (NNLO)

First ATLAS  $Z(v\bar{v})\gamma$  differential measurement

Good agreement with NLO MCFM and fair agreement with Sherpa and MMHT NNLO for most of bins within uncertainties.

# Differential cross-sections for $l\bar{l}\gamma$

*Unfolded  $m[l\bar{l}\gamma]$  spectra for inclusive and exclusive selection*

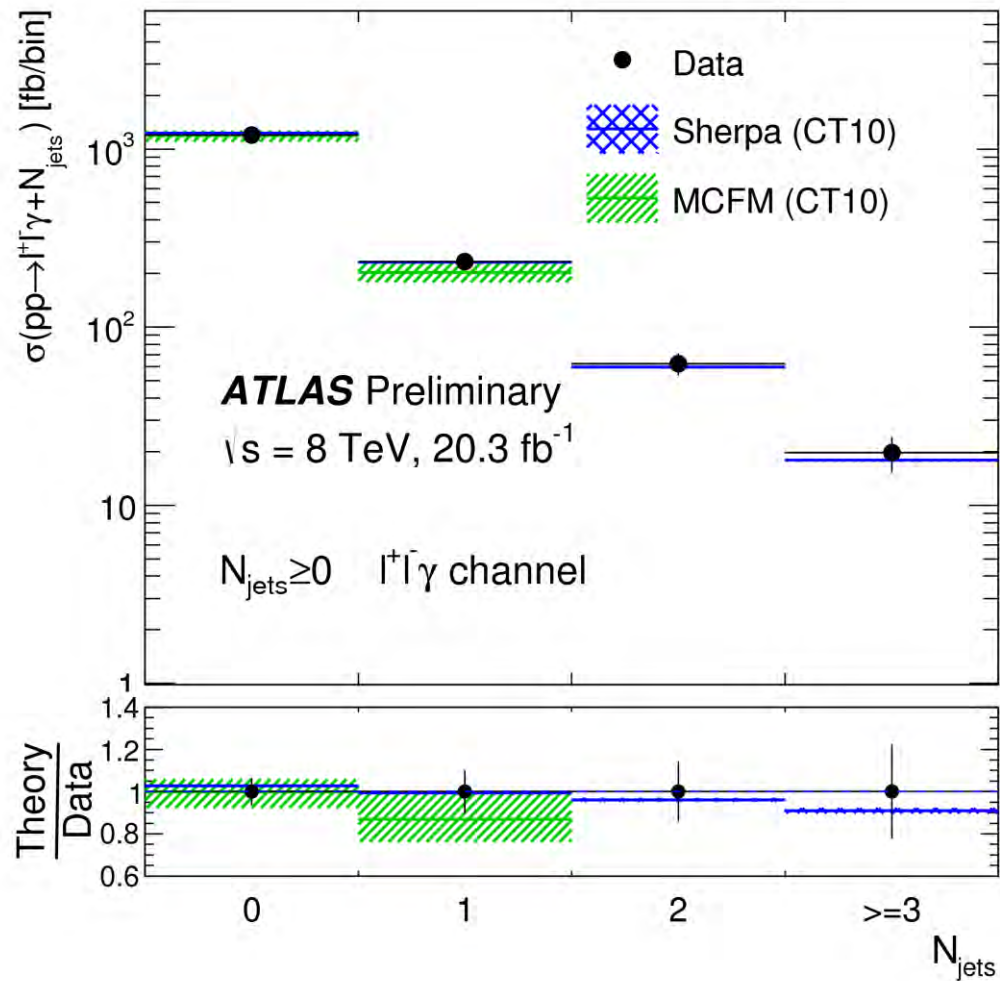

Comparison to Sherpa, MCFM and MMHT (NNLO)

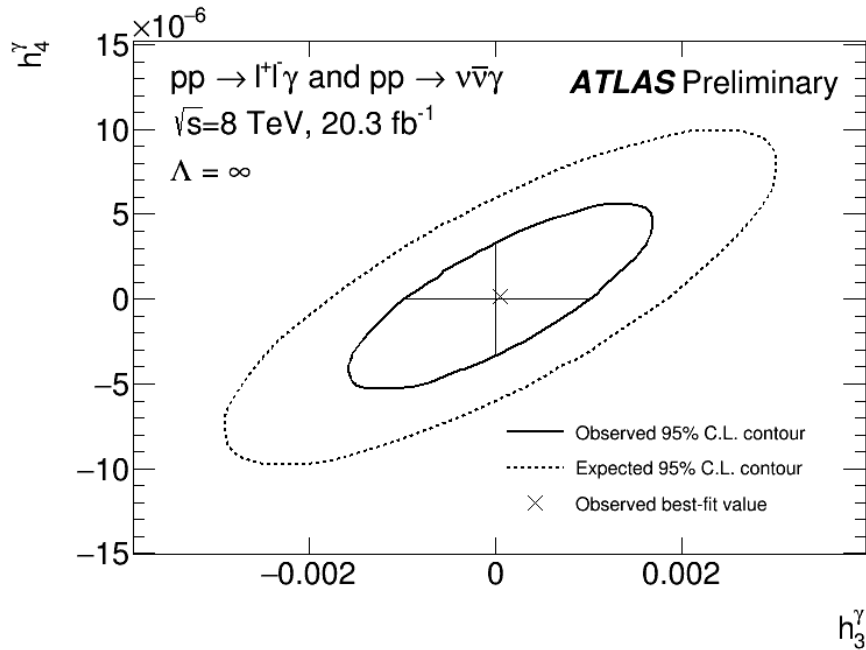

# Differential cross-sections for $l\bar{l}\gamma$

*Unfolded jet multiplicity distribution*

Comparison to Sherpa and to MCFM (two first bins only)
