ASPiS: integrating iRODS with Shibboleth and provenance engines

lundi 2 février 2009 11:00 (30 minutes)

Natively, iRODS addresses authentication by means of locally managed user lists or X509 certificates. The ASPiS project is integrating iRODS with Shibboleth, to enable authentication to be devolved onto the user's home institution, and to suppport attribute/role-based authorisation decisions within the iRODS context. The project is also integrating iRODS with external provenance engines (PASOA and KARMA), to captute provenance data for scientific processes. Both integration approaches will make use of the rule system as far as possible.

Orateur: M. LIAO, Eric

Classification de Session: Talks from various projects
