

MUSE observations of magnified star-forming galaxies

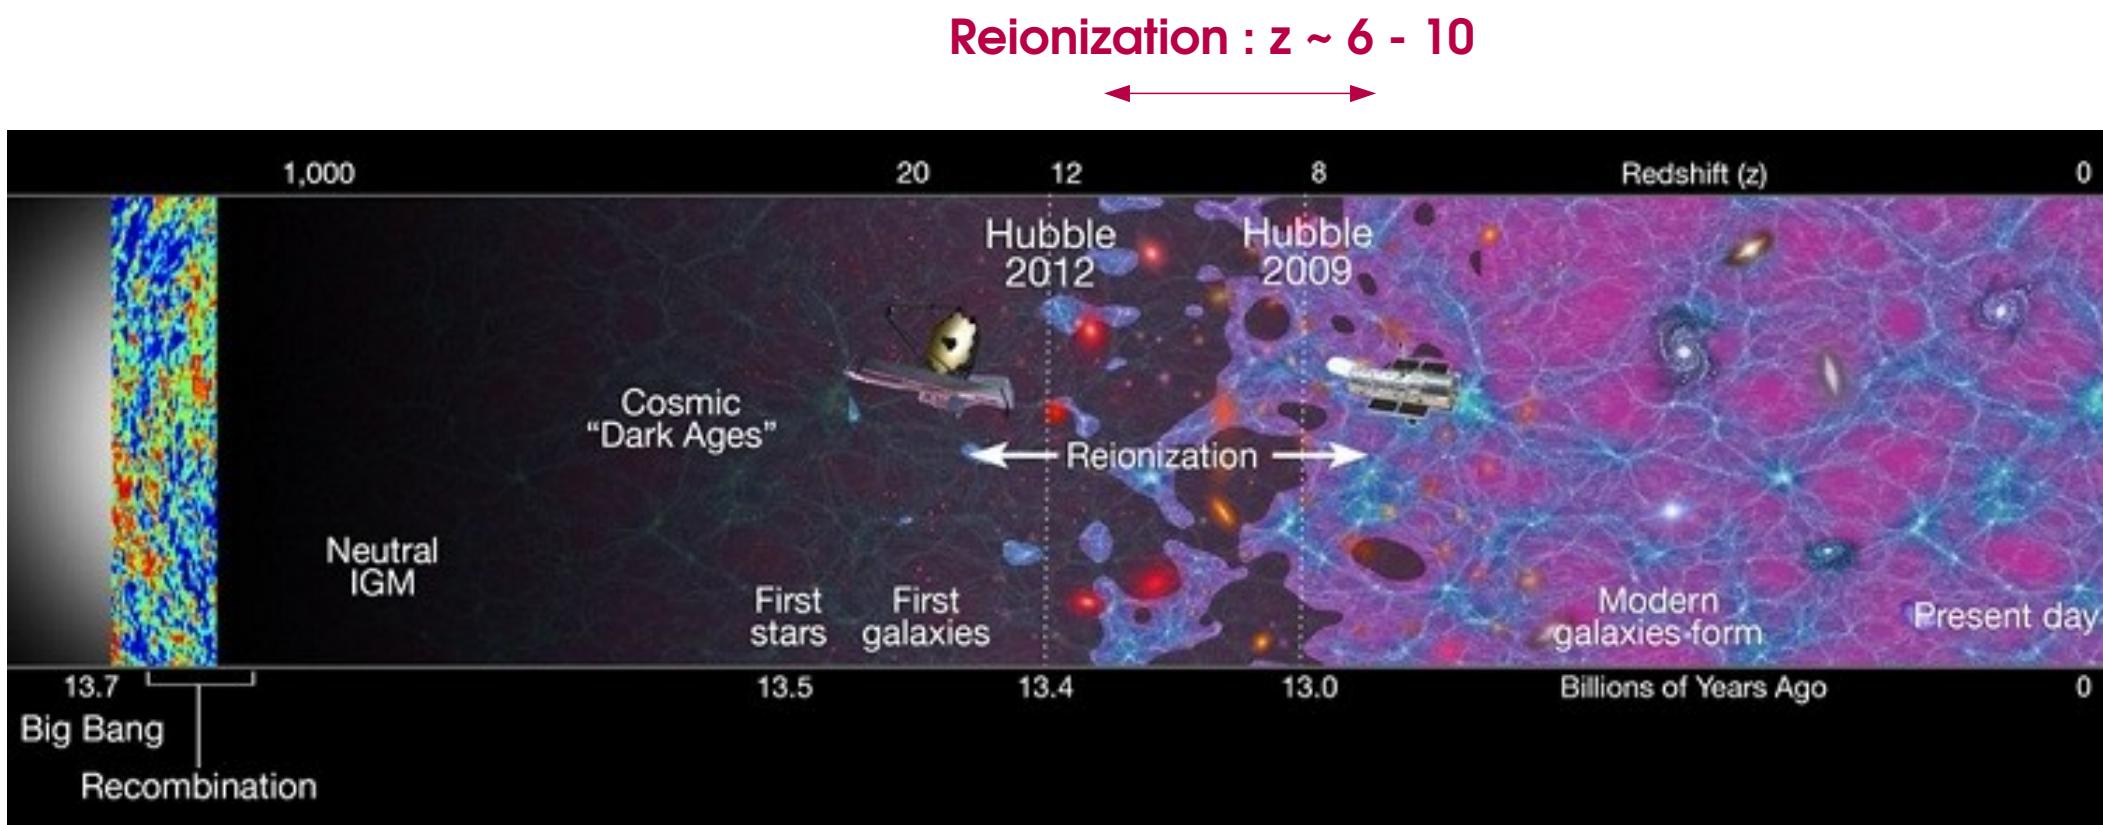

A complete census of sources responsible for the
reionization

David BINA (IRAP)
Supervisor : Roser Pello (IRAP)

*zSurvey Meeting
9 december 2015*

Context

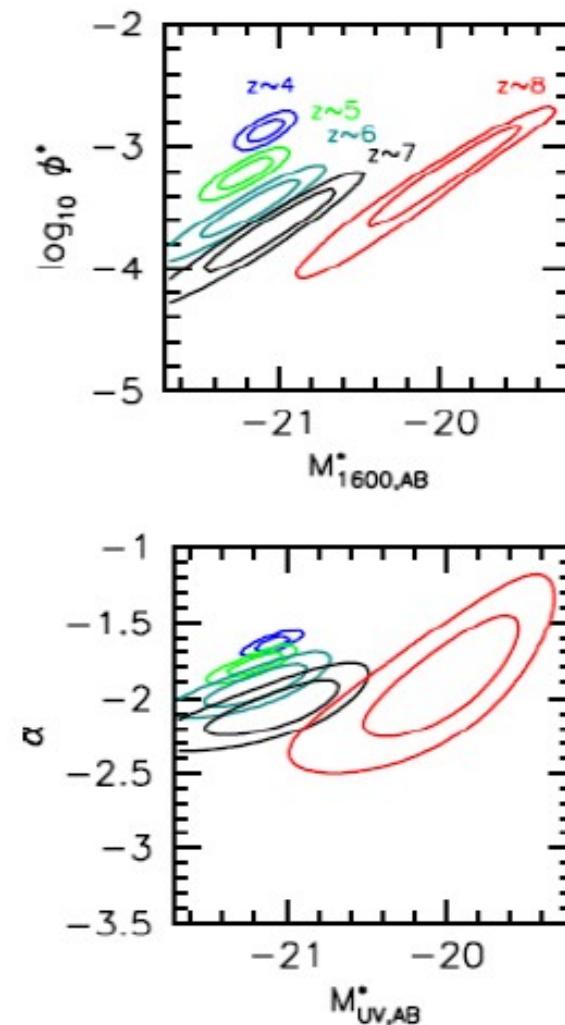

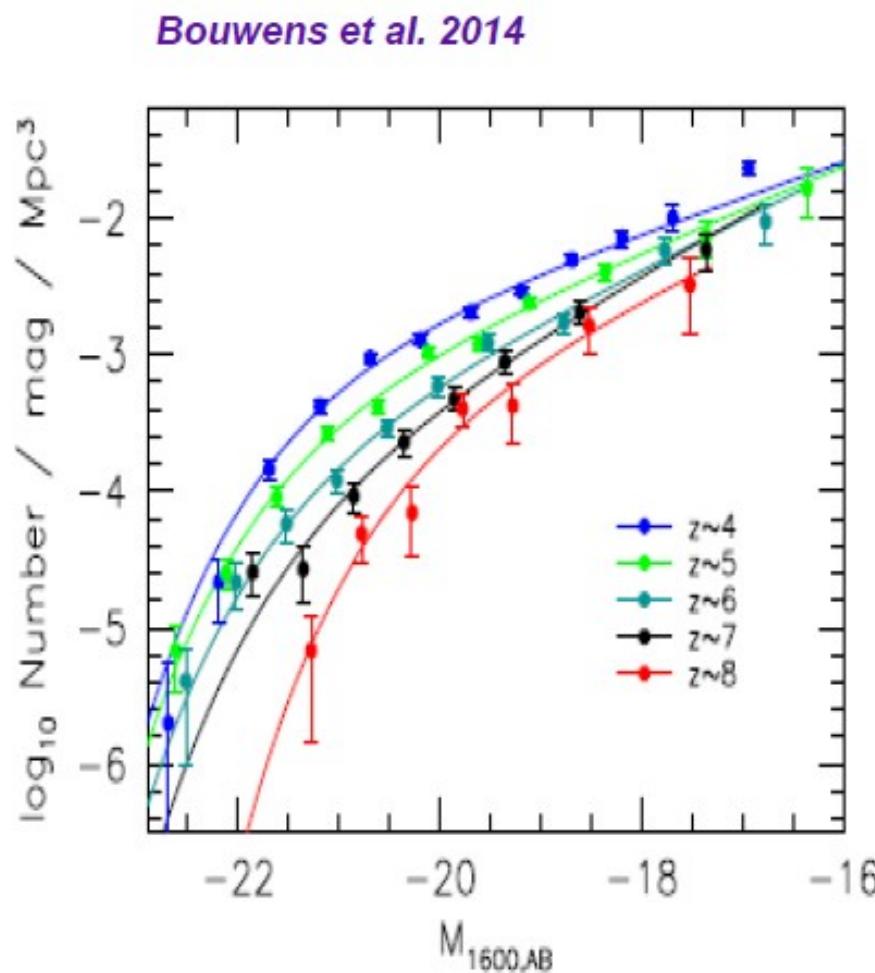

Science goals : investigate the birth of the **first objects** out from the dark ages
get constraints on **reionizing sources** (LF, SFR, stellar mass etc.)

Luminosity function of high-redshift galaxies

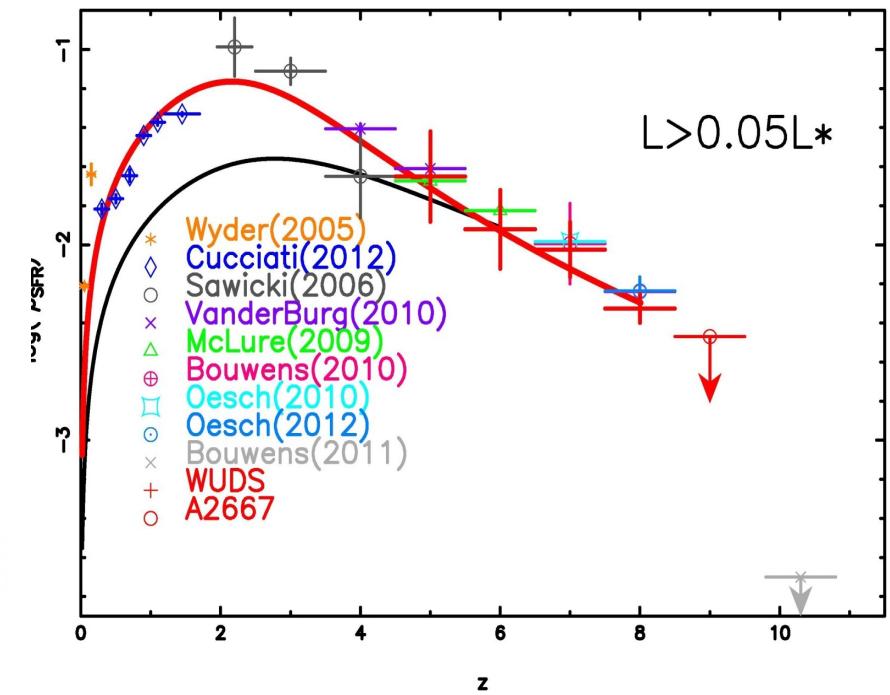

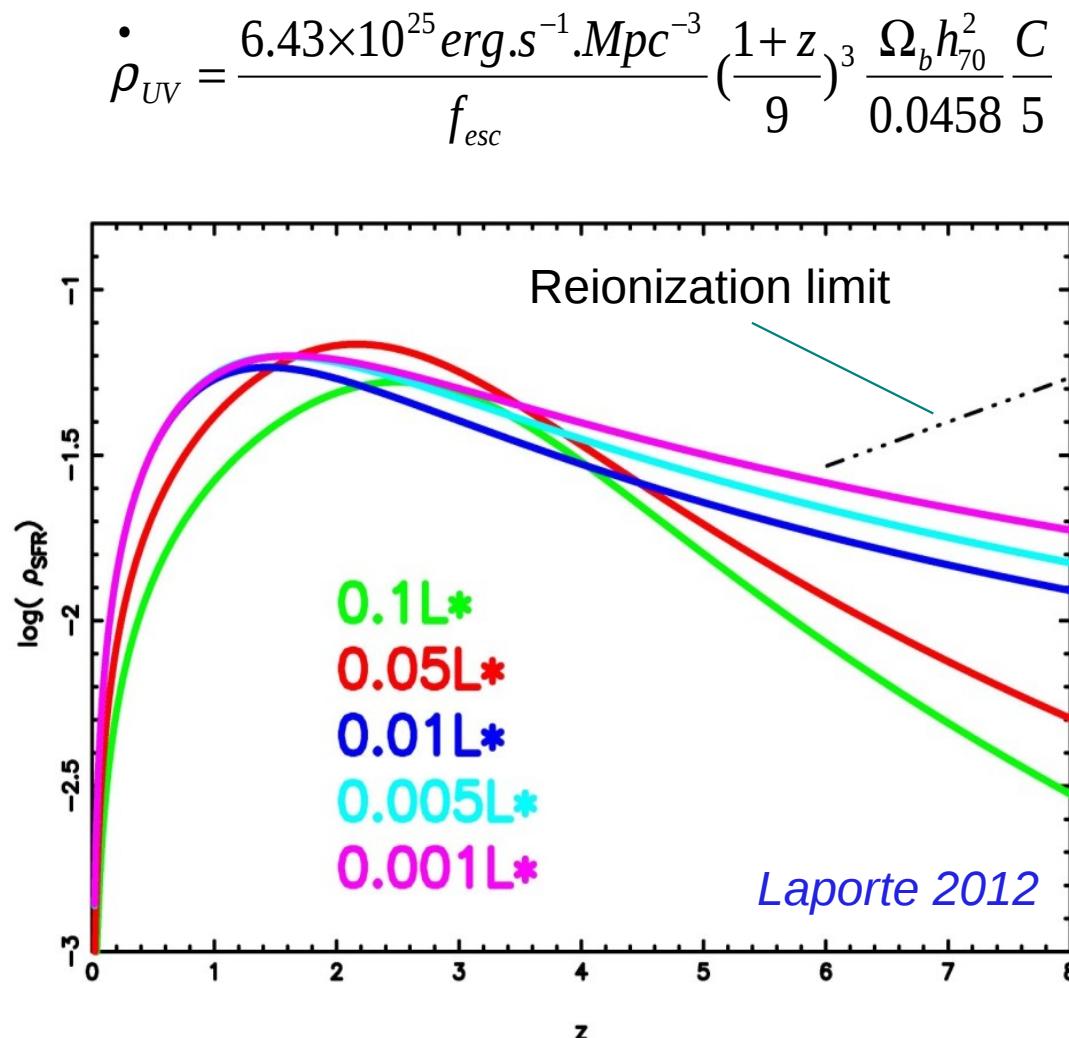

LF :
$$\Phi(L) = \frac{\Phi^*}{L^*} \left(\frac{L}{L^*} \right)^\alpha \exp \left(-\frac{L}{L^*} \right)$$
 $\alpha < 0$

Evolution of the LF with the redshift :

One question about the reionization

- Which sources are responsible for the reionization ?

$$\rho_{UV} = \int_{0.05L_{z=3}^*}^{\infty} L_{1500} \Phi(L_{1500}) dL_{1500}$$

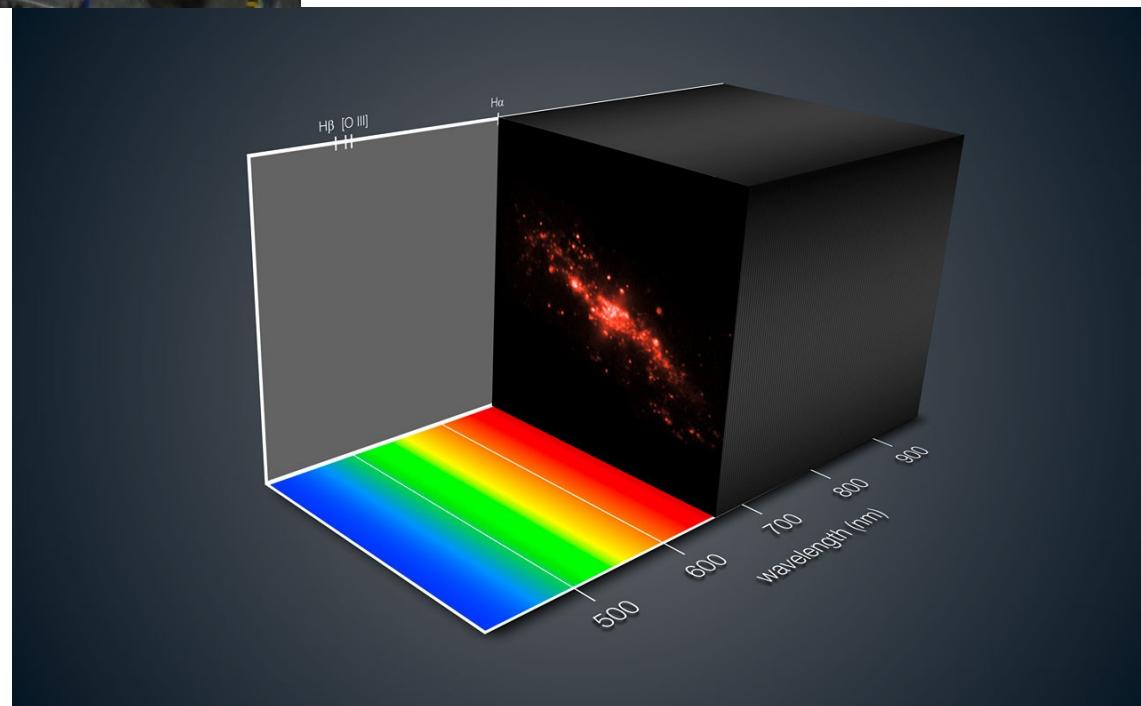

→ Many fainter sources that we cannot observe for now ?

MUSE : 3D spectrography

Installed in January 2014
on the VLT (Chili)

It consists in 24 IFUs for a 1 arcmin² field of view in the range ~ 475 - 950 nm

Commissioning data paper

MUSE observations of the lensing cluster Abell 1689

D. Bina^{1,2}, R. Pelló^{1,2}, J. Richard³, J. Lewis^{1,2}, V. Patrício³, S. Cantalupo⁴, E. C. Herenz⁵, K. Soto⁴, P. M. Weilbacher⁵, R. Bacon³, J. D. R. Vernet⁶, L. Wisotzki⁵, B. Clément³, J. G. Cuby⁷, D. J. Lagattuta³, G. Soucail^{1,2}, and A. Verhamme^{3,8}

Combination of LSDCAT and Muselet for the detection of sources
+ test with CubEx
+ manual check

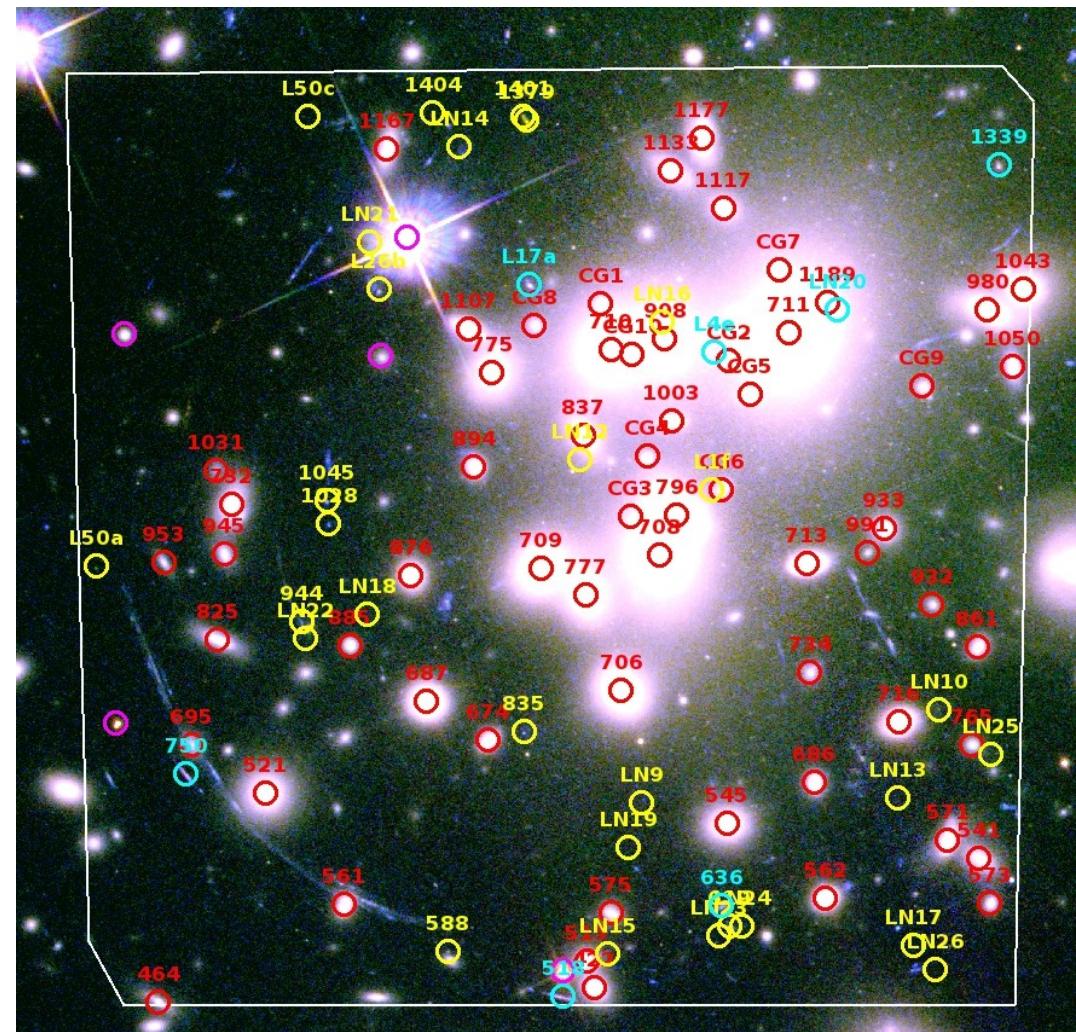

FOV : 1 x 1 arcmin²

6 exposures of 20min (~2h)

Seeing ~ 0.6'' at 7300Å

21 line emitters (7 known + 14 new)

17 LAEs

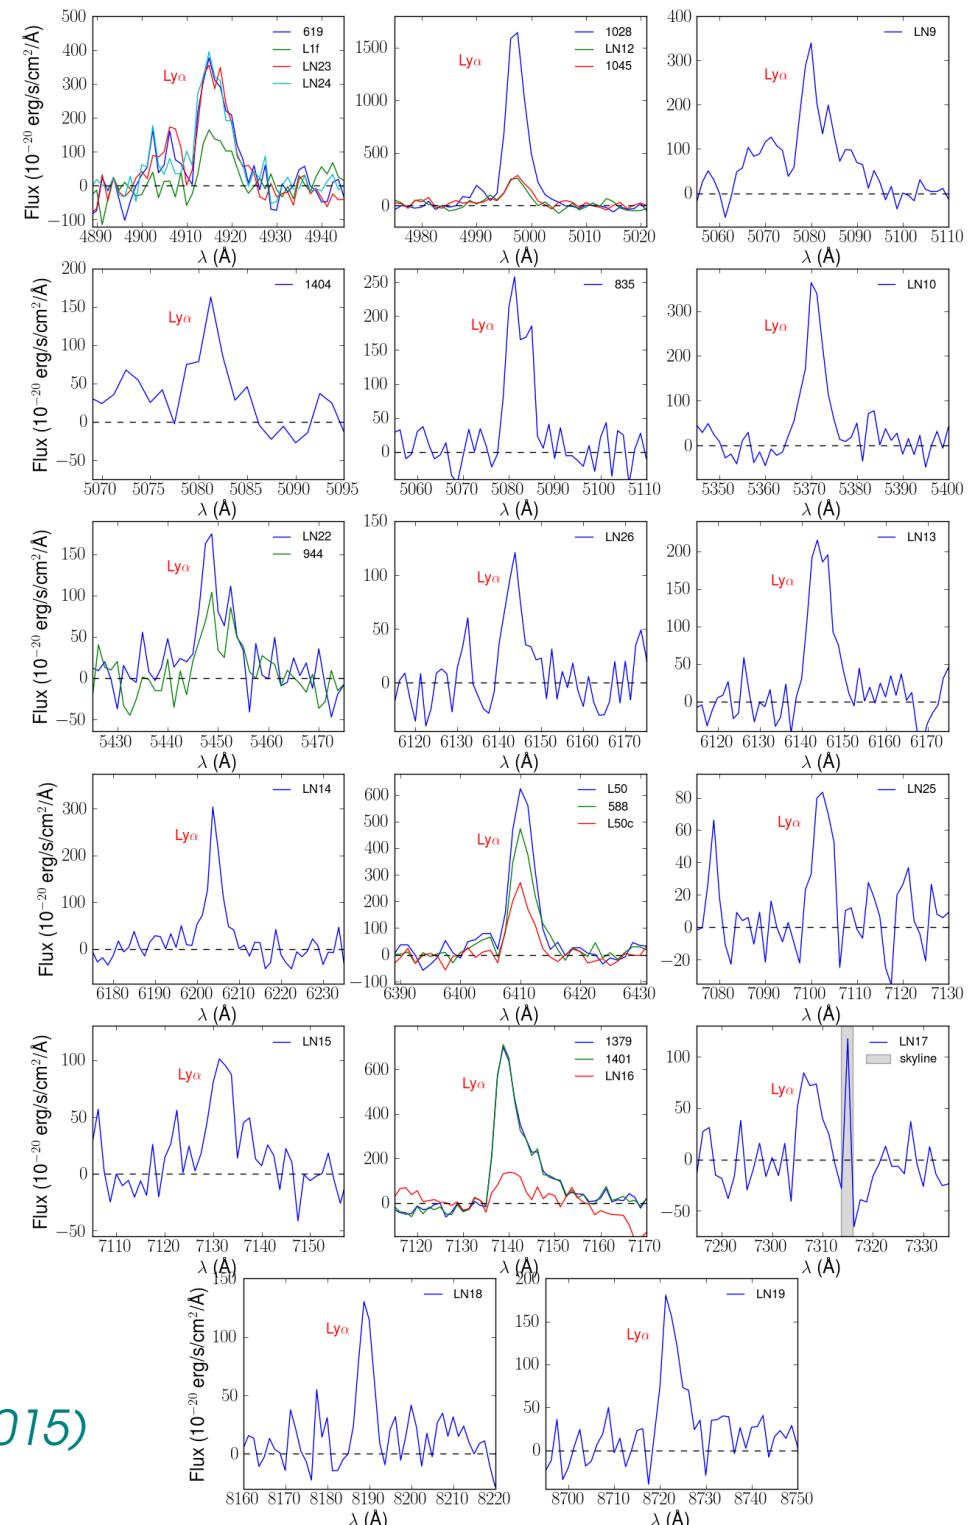

17 LAEs :

Redshift : $3 < z < 6.2$

Magnification : $4.5 < \mu < 75 !$

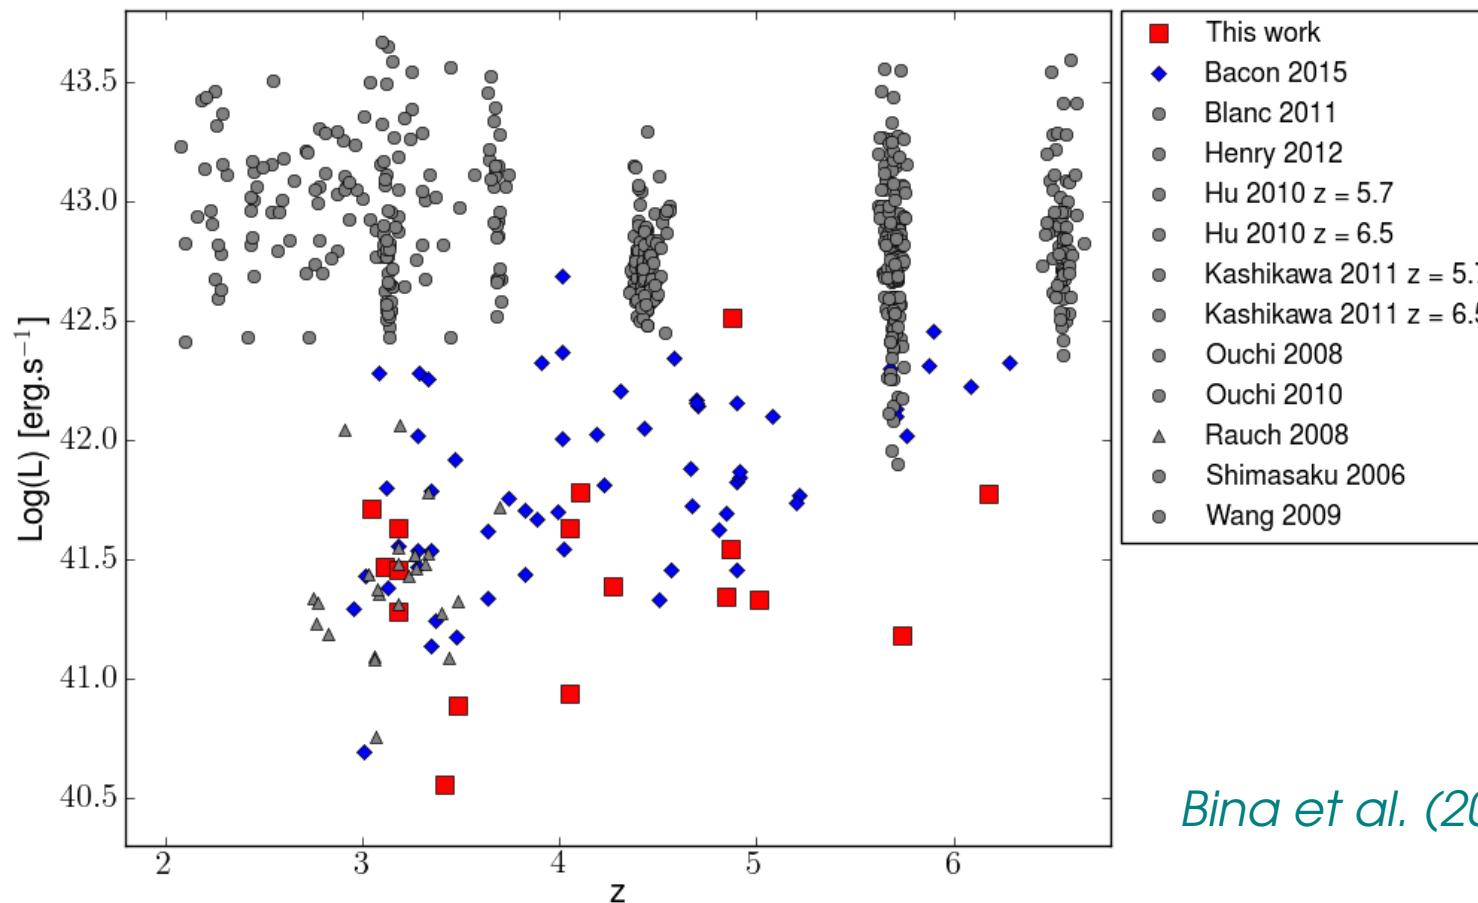

Flux : $40.5 < \log(\text{Ly}\alpha) < 42.5$

Bina et al. (2015)

What about the luminosity ?

- Narrow band surveys vs MUSE :

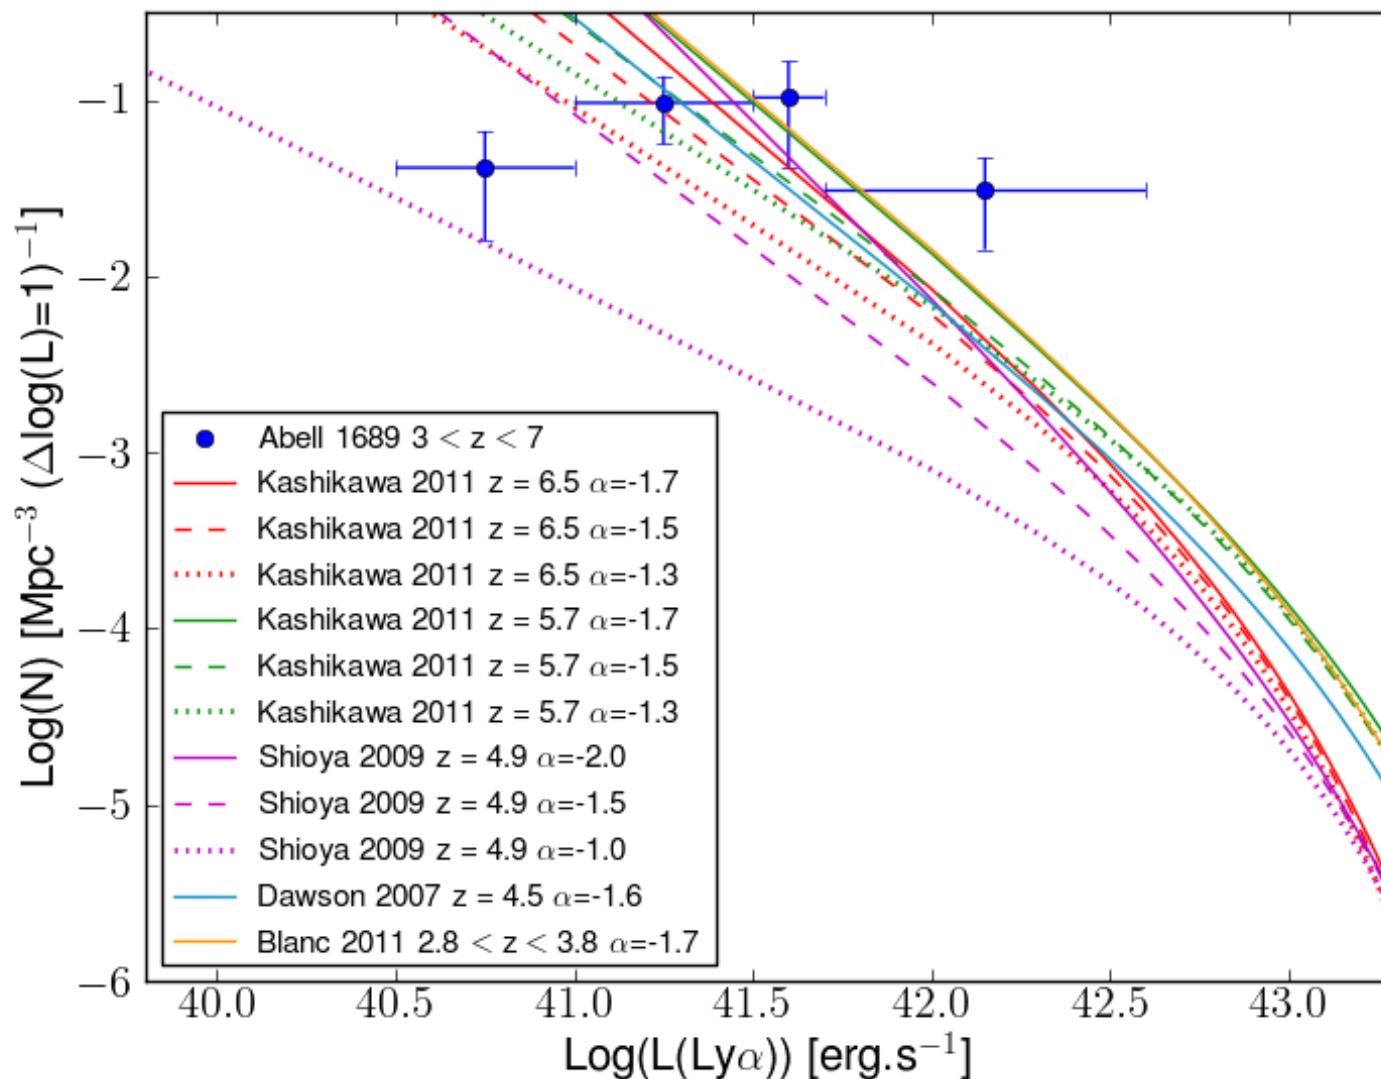

Bina et al. (2015)

- More scattered sources
- Fainter sources

What about the luminosity function ?

Our 17 LAEs : slope of the LF steeper than -1.5 ?
+ completeness incoming...

Bina et al. (2015)

Next steps

- Do the same work on other clusters : A2390, A2744, A2667...
- Constrain the faint-end of the LF with a robust sample of LAEs
- Work out properly the completeness and take it into account for the LF
- Calculate the number of ionizing photons of our LAEs and compare with needed ones to reionize entirely the Universe

Thank you !
