

The Double Chooz experiment @CCIN2P3

February 9th -CCIN2P3 -Lyon

Timothée Brugière
IPHC

Measuring the oscillation

$$\Delta m^2_{\text{atm}}, \theta_{\text{atm}}$$

$$\Delta m^2_{\text{sol}}, \theta_{\text{sol}}$$

$$\Delta m^2_{ij} = m^2_i - m^2_j$$

Exploring the neutrino mixing

$$\nu_{\alpha L} = \sum_i U_{\alpha i} \nu_{iL}$$

Oscillation parameters :

- $\theta_{12}, \theta_{13}, \theta_{23}$
- $\Delta m^2_{21}, \Delta m^2_{31}$
- δ_{CP}

Oscillation physics

$$U = \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta} & 0 & c_{13} \end{pmatrix} \begin{pmatrix} c_{21} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} e^{i\alpha_1} & 0 & 0 \\ 0 & e^{i\alpha_2} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

**Atmospheric
sector**

**Interference
sector**

**Solar
sector**

$$c_{ij} = \cos \theta_{ij}$$

$$s_{ij} = \sin \theta_{ij}$$

$0\nu\beta\beta$

[Double beta decay]

Double beta decay
which emits anti-neutrinos

Neutrinoless
double beta decay

Neutrino oscillations

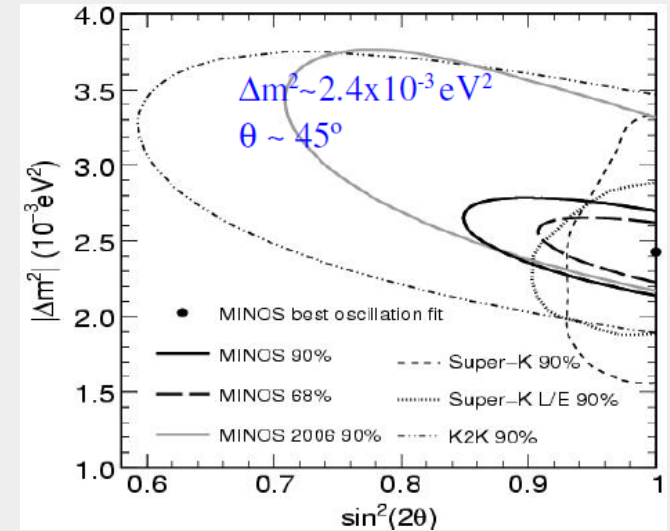

Experimental results :

- $|\Delta m^2_{\text{atm}}|, \theta_{\text{atm}} \rightarrow$ Minos and Super-K
- $\Delta m^2_{\text{sol}}, \theta_{\text{sol}} \rightarrow$ Kameland and solar data

$$\theta_{13} \sim 8.5^\circ$$

Double Chooz, Daya-Bay, Reno
+ accelerators

- Sign of m^2_{atm} (hierarchy)
- Measurement of δ_{CP}
- Design of next experiments

The Double Chooz experiment

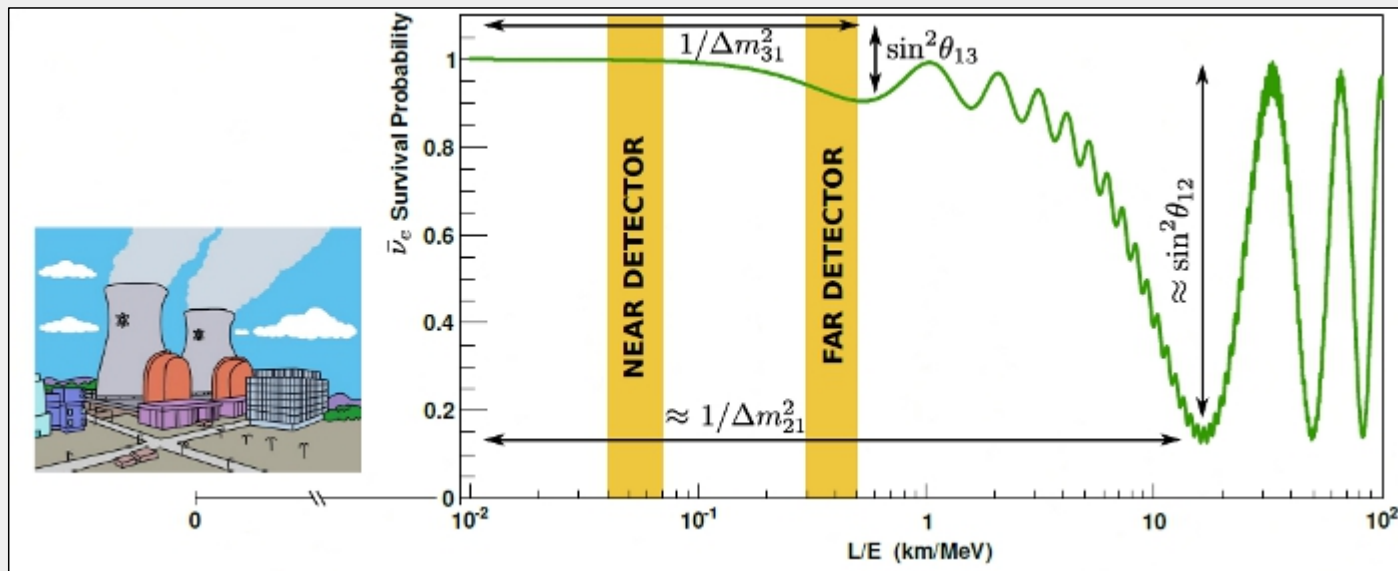

Aim of the Double Chooz experiment:

→ Measurement of θ_{13} through the observation of $\bar{\nu}_e \rightarrow \bar{\nu}_e$ transition according to the oscillation probability :

$$P_{\bar{\nu}_e \rightarrow \bar{\nu}_e} = 1 - \sin^2(2\theta_{13}) \sin^2\left(\frac{\Delta m_{31}^2 L}{4 E}\right) + O(10^{-3}) \quad \text{for } L/E \lesssim 1$$

- **Reactors:** Pure $\bar{\nu}_e$, low energy, high intensity (10^{21} $\bar{\nu}_e$ /s), "Cheap"
- **Short baseline** (~ 1 km) : no matter effect

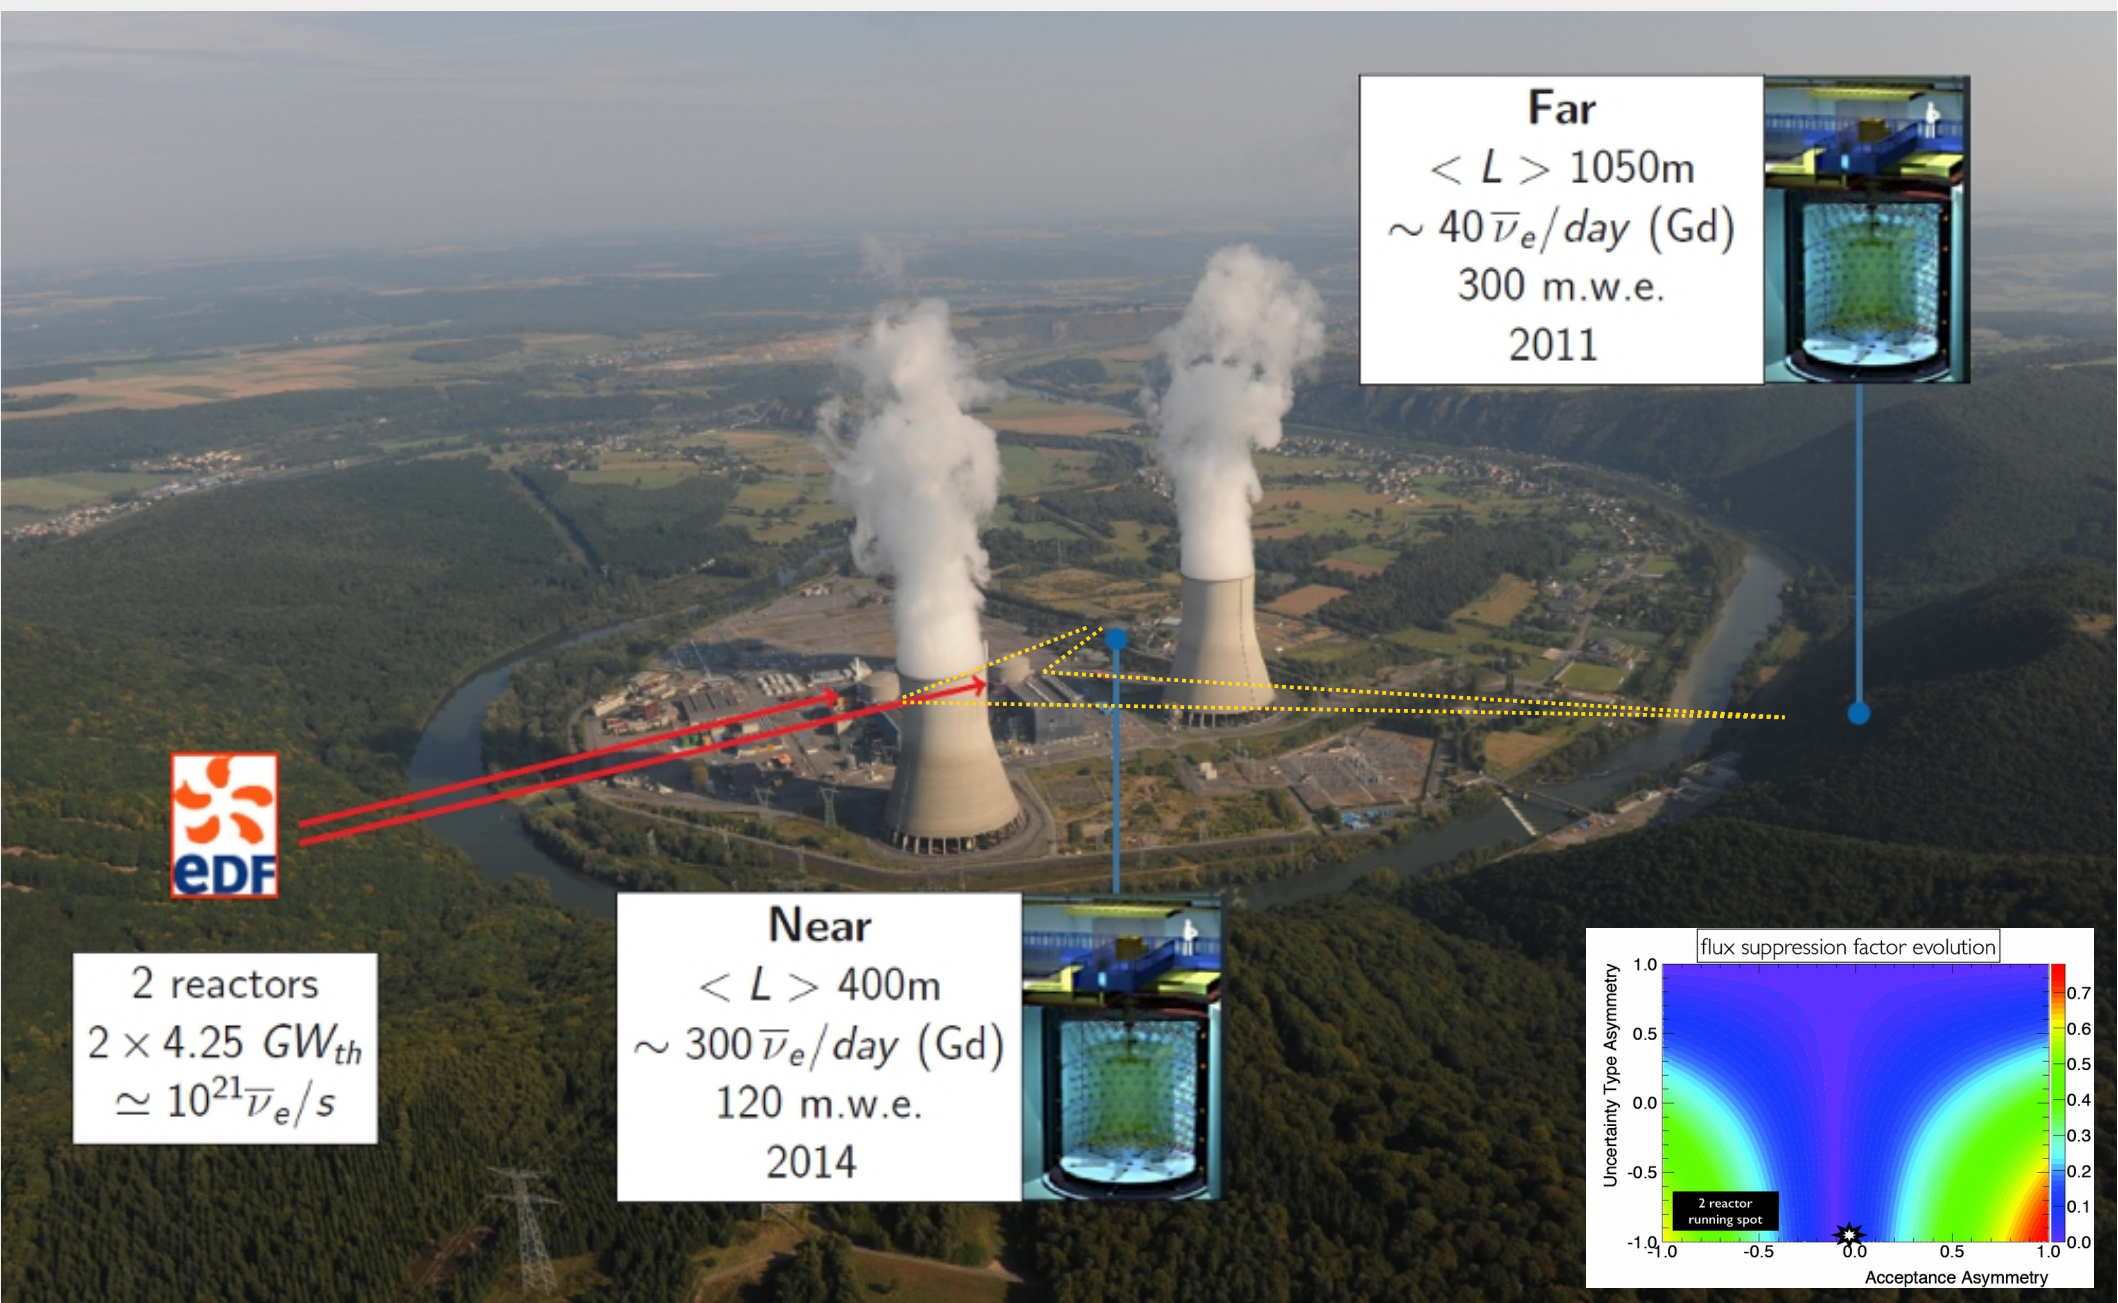

Unoscillated flux & spectrum
→ Cancel flux and efficiency uncertainties

Oscillated flux & spectrum
→ θ_{13} measurement

Power plant @ Chooz (France)

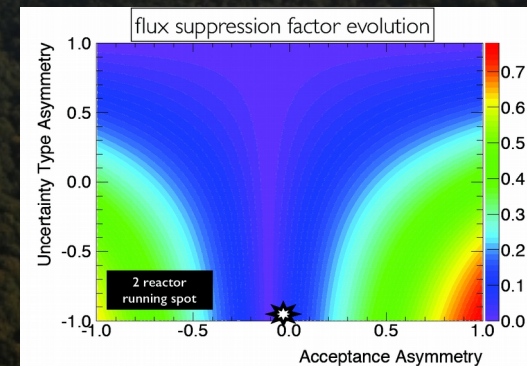

2 reactors
 $2 \times 4.25 \text{ GW}_{th}$
 $\simeq 10^{21} \bar{\nu}_e / s$

Near
 $\langle L \rangle 400\text{m}$
 $\sim 300 \bar{\nu}_e / \text{day (Gd)}$
120 m.w.e.
2014

Far
 $\langle L \rangle 1050\text{m}$
 $\sim 40 \bar{\nu}_e / \text{day (Gd)}$
300 m.w.e.
2011

First indication of non-zero θ_{13} and Rate+Shape analysis
Phys. Rev. Lett. 108 (2012) 131801

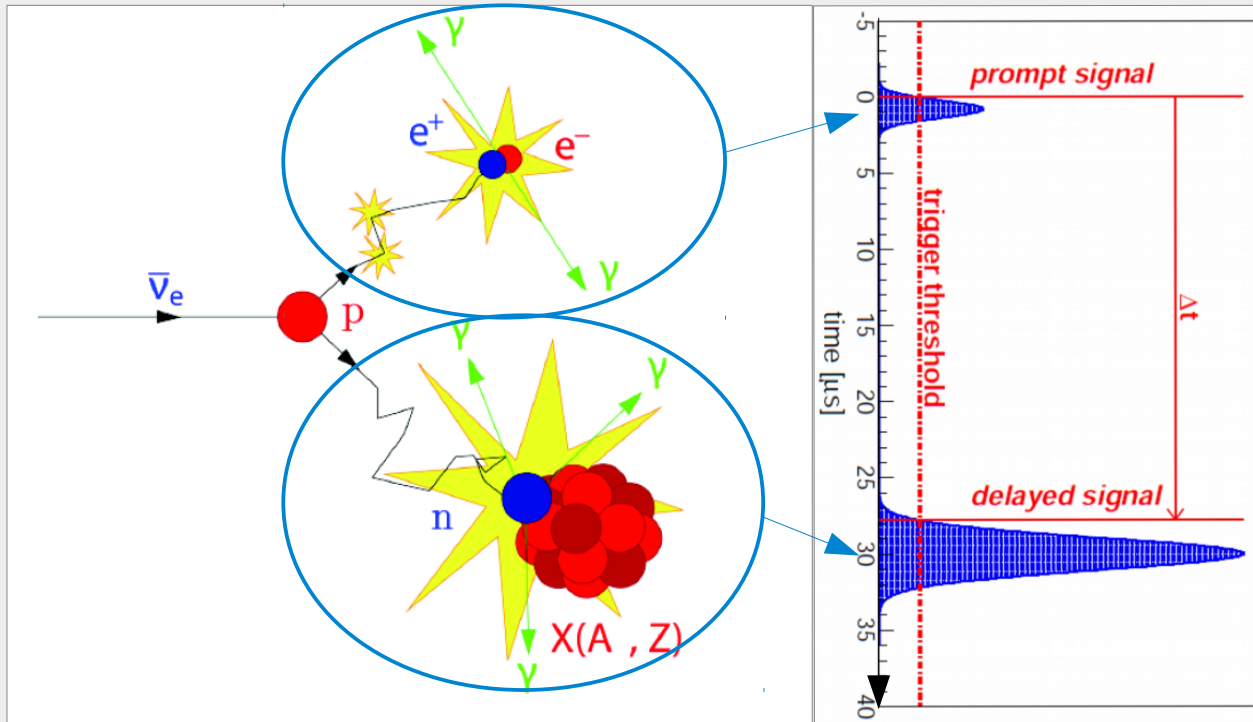

First n-H capture analysis
Phys. Lett. B723 (2013) 66-70

First (and only) Reactor Rate Modulation (RRM) analysis
Phys. Lett. B735 (2014) 51-56

First publication on the 5 MeV excess"
JHEP 1410 (2014) 86

RRM Gd + H Combined analysis
arXiv:1510.08937 (2015)

Inverse β decay (IBD)

Prompt signal:

- e^+ ionization and annihilation
- Energy proportional to E_ν

$$\rightarrow E_{\text{prompt}} = E_\nu - E_n - 0.8 \text{ MeV}$$

10-40 keV

Delayed signal:

- γ rays from neutron capture
- on **Gd** : 8 MeV / $\tau \sim 30\mu\text{s}$
- on **H** : 2.2 MeV / $\tau \sim 200\mu\text{s}$

→ Clear twofold coincidence signature

Neutrino detection in Double Chooz

prompt signal: scintillation + e^+ annihilation
 $E_{\text{prompt}} \approx E(\nu_e) - 0.8 \text{ MeV}$

delayed signal: γ ray(s) from neutron capture
 n-Gd $E_{\text{delayed}} \approx 8.0 \text{ MeV}$ $\Delta T \approx 30 \mu\text{s}$
 or n-H $E_{\text{delayed}} \approx 2.2 \text{ MeV}$ $\Delta T \approx 200 \mu\text{s}$

Neutrino target:
 liquid scintillator PXE + Gd

Gamma catcher:
 liquid scintillator PXE (no Gd)

Buffer volume:
 transparent mineral oil
 with 390 x 10" PMTs assembly

Inner Veto:
 liquid scintillator (LAB)
 with 78 x PMTs 8"

Outer Veto:
 plastic scintillator strips

← 398 PMTs

← 78 PMTs

Data:

- 1 Waveform:
 → 128 * sizeof(double)
- 1 event:
 → ~ 0.5 Mo

- **IBD threshold :** 1.8 MeV
- **Shielding :** Far → 150 mm of steel
 Near → 1 m of water

Accidental BG

Fast neutrons

Correlated BG

Stopping μ

Cosmogenics

Prompt

Radioactivity from materials, PMTs, surrounding rock (^{208}Tl).

Neutrons from cosmic μ spallation gives recoil protons (low energy).

Cosmic μ entering from the chimney.

Electrons from $^9\text{Li}/^8\text{He}$ $\beta + n$ decays.

Delay

Neutrons from cosmic μ spallation captured on Gd/H, or γ like prompt fake signal in case of H analysis.

Neutrons from cosmic μ spallation captured on Gd/H, or γ like prompt fake signal in case of H analysis.

Michel electrons.

Neutrons from $^9\text{Li}/^8\text{He}$ $\beta + n$ decays captured on Gd/H.

Candidates Selection

- Single event selection:

	<i>n-Gd analysis</i>	<i>n-H analysis</i>
After- μ veto	1 ms	1.25 ms
Others	Light noise rejection	

- IBD selection:

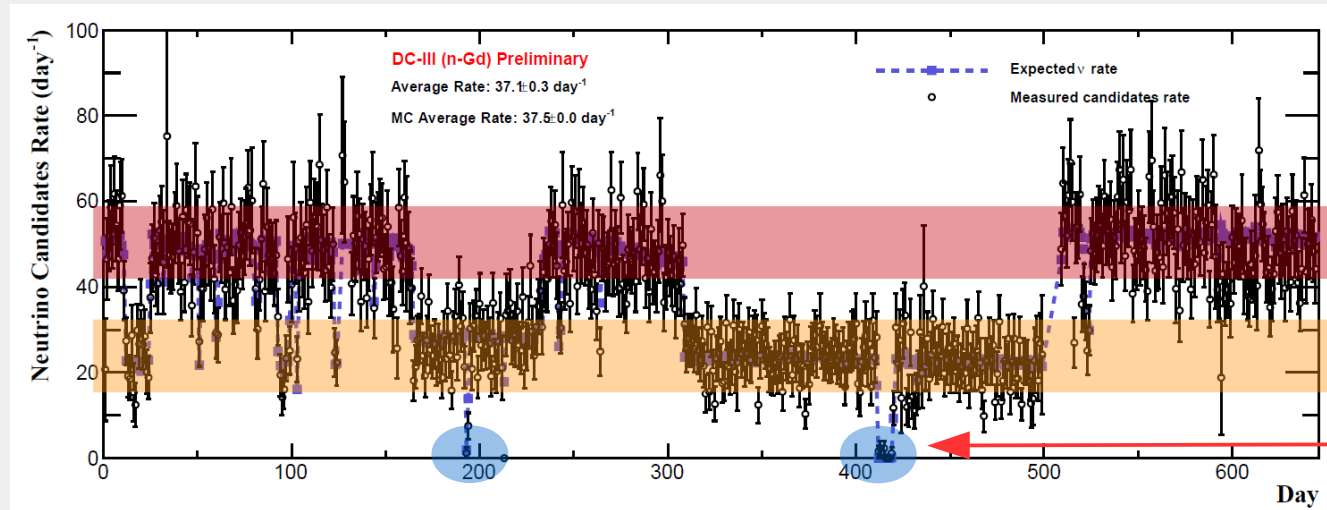

E_{prompt} window	0.5 -20 MeV	1 -20 MeV
E_{delayed} window	4 -10 MeV	1.3 -3 MeV
Multiplicity cut (prompt)	200 μ before → 600 μ after	800 μ before → 900 μ after
Other vetos	OV, IV, FV, ${}^9\text{Li}$ likelihood	
Isolation (prompt-delayed)	$0.5 < \Delta T_{\text{p} \rightarrow \text{d}} < 150 \mu\text{s}$	$0.5 < \Delta T_{\text{p} \rightarrow \text{d}} < 800 \mu\text{s}$
	$\Delta R_{\text{p} \rightarrow \text{d}} < 1 \text{ m}$	$\Delta R_{\text{p} \rightarrow \text{d}} < 1.2 \text{ m}$
ANN		ANN output > -0.23

→ All analysis done @CCIN2P3 !

Neutrino Data

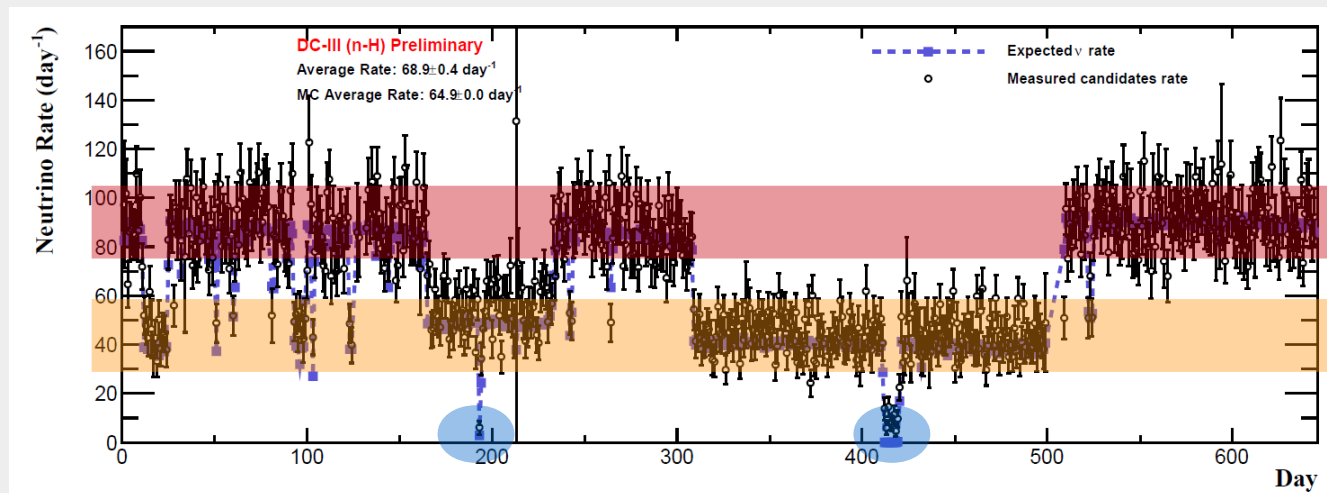

- **Gd analysis:** 460.67 days with reactors / 7.24 days 2-reactors off

← 2 reactors ON (~ 60 %)
← 1 reactor ON (~ 40 %)
← 0 reactor ON

- **H analysis:** 455.57 days with reactors / 7.15 days 2-reactors off

Reactor Rate Modulation (RRM)

- **Gd+H combined analysis :**

→ Compare observed and expected IBD rate at different reactor powers

→ Fit θ_{13} and **total background rate**

Unique 2-reactor
off data

$$\sin^2 2\theta_{13} = 0.088 \pm 0.033$$

No correlation assumed (minimal impact)

Rate + Shape fit

- The rate and the shape information were used in the fit for θ_{13} measurement
- The major improvements with respect to previous analyses are:
 - Finer binning (more statistics)
 - Larger energy range (0.5 –20 MeV)
 - more precision on the background
 - Data driven background shape
 - Reactor off-off data included as a separate term in the χ^2 (low stat → rate only)

Results:

On Gd

$$\sin^2 2\theta_{13} = 0.090^{+0.032}_{-0.029}$$

arXiv:1406.7763 (hep-ex)

On H

$$\sin^2 2\theta_{13} = 0.124^{+0.030}_{-0.039}$$

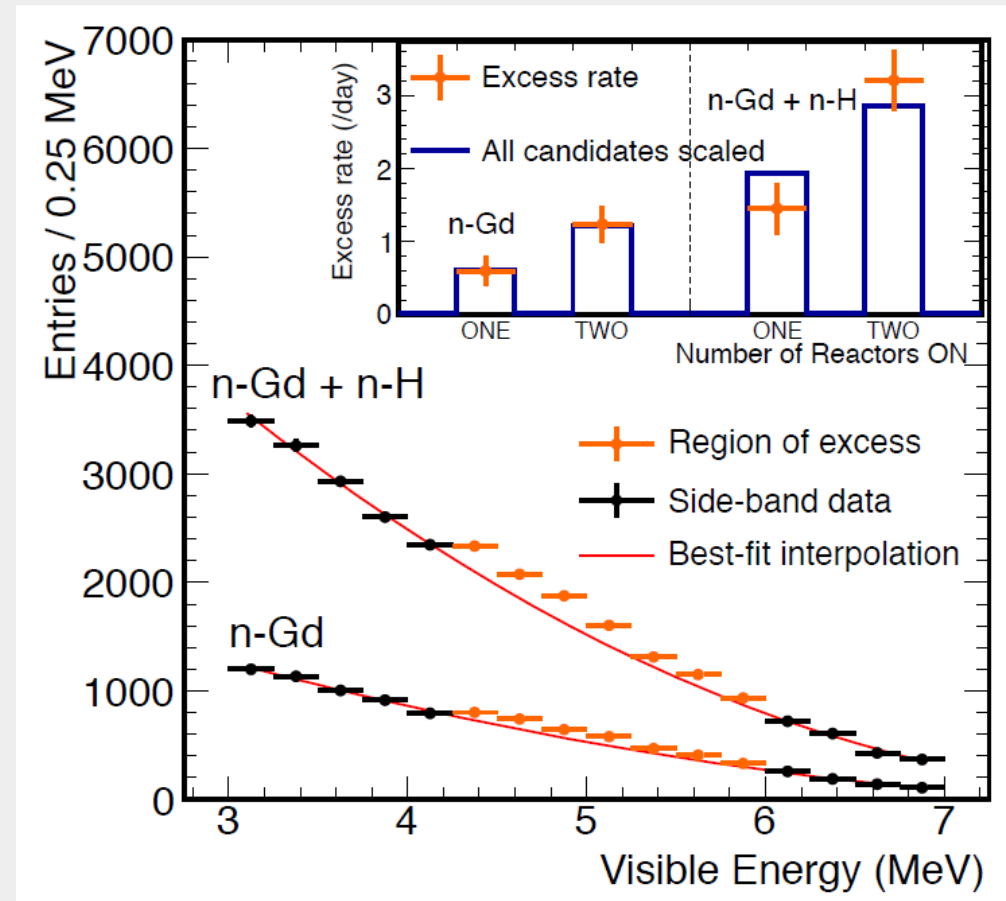

arXiv:1510.08937 (hep-ex)

Excess @ 5 MeV

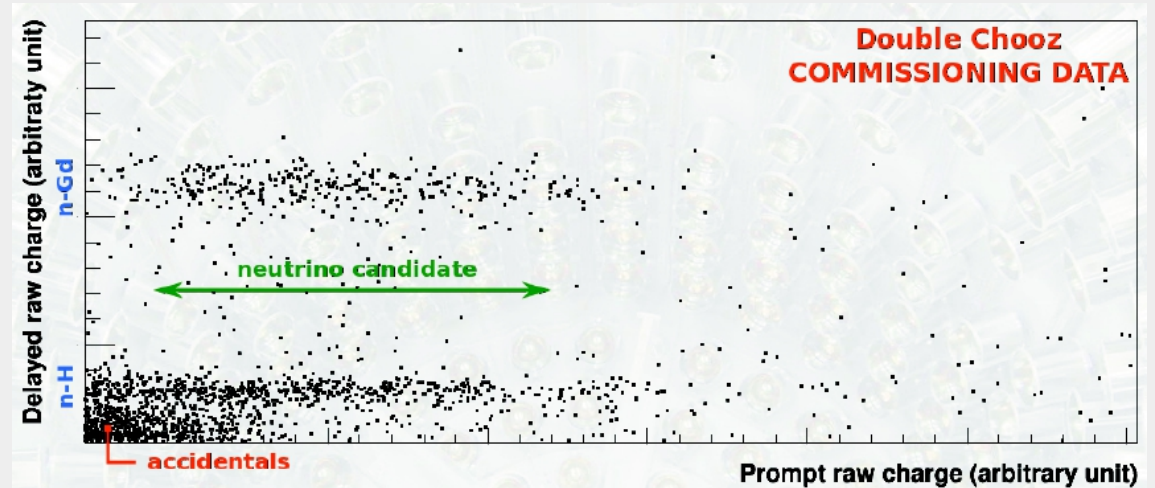

- On Gd : excess $\sim 3\sigma$
(computation on-going for H)
- Given the results of RRM + the tests with addition artificial excess around 5 MeV:
→ **no impact** seen on θ_{13} measurement
- The strong correlation of the excess with the reactor power (in both Gd and H):
→ **points** indeed towards an **unaccounted component of the reactor flux**
→ **disfavors** the possibility of an **unaccounted background component**

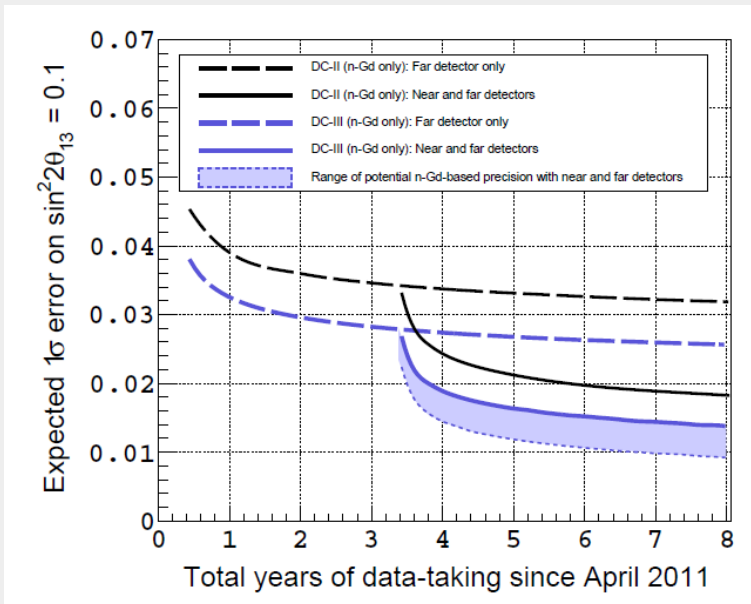

(From Gd 2014 analysis, uses a simplified n-H selection)

Future with Near+Far data

- The near detector commissioning ended in December 2014 and the **data taking has started**
- The projected sensitivity shows an error on $\sin^2 2\theta_{13}$ of 0.015 in 3 years
- Further analysis improvements will make possible a reduction to the level of $\sigma \sim 0.01$

**➔ New results coming soon !
But also more data !**

Dynamic Data Reduction (DDR)

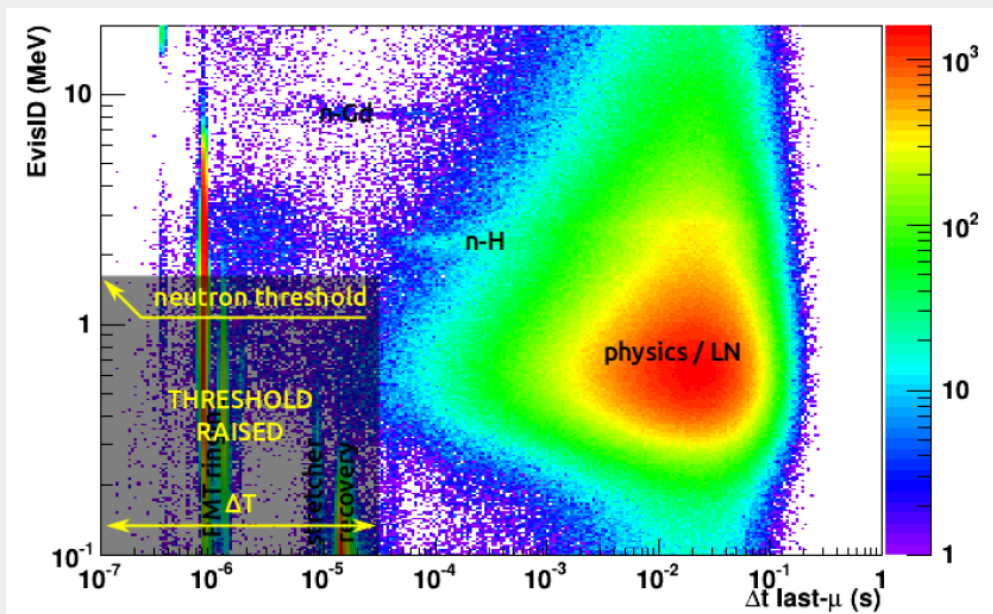

Near Detector = More Data !

- Muon flux higher @ Near (less overburden)
- "Light Noise" @ Far (PMT radioactivity)

Dynamic Data Reduction:

- Online cuts:
 - 75% of the LN events removed
 - reduced data for μ and after- μ event
- Threshold raised after a muon
 - avoid ghost trigger, PMT ringing

Data transfert Chooz → CCIN2P3

→ Bandwidth occupancy Near+Far lower than Far only !

States were last updated at: Sun Dec 20 18:24:03 CET 2013 (offset between individual system states < 3 sec).

- Useful for users:** [read section 4.6 of the shifter manual](#) | [read the DB manual](#) | [see stalled data flows](#)
- Diagnostics (for experts):** [see current diagnostics](#) | [see long term diagnostics](#) | [see the server logs at Chooz](#) | [see ELOG](#) | [see the service status of EC](#)

Below you learn what the states mean:

Status	FINE	server.in2p3.fr	WARNING	NO UPDATE	CRITICAL	UNKNOWN	ERROR	Database expert contact details
Meaning	Within expectation	Active host server	Just within expectation	Data flow from detectors is stalled	Out of expectation	No connection to server / server error	Monitor error	<p>Contact expert via email Email account: dchooz-hardware-3b@physk.rwth-aachen.de</p> <p>Call expert via Skype Please ring at least for 60 sec for the call forwarding Skype account (calls only): dc.aachen</p>
Explanation	All monitored parameters are within their required ranges.	The servers visible to the users are only virtual servers hosted by physical servers.	The system is still alright, it is just slow, very occupied or a redundant component has failed.	At least one detector component has unexpectedly stopped to write data into the databases.	A system failure has happened or is imminent.	A connection to the server cannot be established. The server or network might be down.	The system is probably alright, it is just this monitor page which has a malfunction.	
Required actions	Smile and be happy.	If you see a server name with a green frame around it, smile and be happy.	No need to panic. Please just observe the system more frequently to see if it recovers or if it becomes critical.	This is not urgent. Please ask the shift leader to drop an email to the databases expert (look right). No need to call or wake up anybody. You can get more info by hitting the "see stalled data flows" button.	Please ask the shift leader to hit the panic button and to call the databases expert (look right) immediately even if he/she has to be woken up.	Check if systems apart from the databases are affected. If this is the case, please ask the shift leader to hit the panic button and to call the databases expert (look right) immediately even if he/she has to be woken up. Else, please ask the shift leader to just drop an email to the databases expert (look right).

* not a limit, used space

- **2017** → Requests ~
- **End of 2017 / early 2018** → End of the data taking, no additional request expected

Some other comments

- **EDF reactor data** → confidential, access granted to only few DC users (power vs. time, fuel composition)
- **Turn over** → regular checks of logins / corresponding storage space
- **Data cleaning** → old / non used data files (not BIN)
- **Backup for BIN files** → @TUM (Munich, Germany), dedicated Irods account
- **Data file transfer to Japan** → dedicated Irods account

DC progress

- May 2008 to October **2010** → Far detector construction
- December **2010** → Far detector filling completed
- April **2011** → Far detector commissioned, start data taking !
- April **2011** → Near lab construction started
- July **2011** → Outer veto commissioned (more data)
- December **2011** → 1st results
- **2012** → First indication of non-zero θ_{13}
- **2013** → First n-H analysis
- **2014** → RRM fit
- December **2014** → Near detector commissioned
- **2015** → new n-Gd / n-H / combined RRM analysis
- 2015 → resources @CCIN2P3 x 4 ! (effort on code stability)
- End 2015 → Data are 6 times faster to produce (vs. early 2015)
- **2016** → **First Near + Far analysis !**
- End of 2017/early 2018 → end of data taking

Remerciements de la part de Double Chooz !
