

Jérôme Baudot teaches and conducts researches at the University of Strasbourg since 1998. He studies particle physics with large international colliders, first with LEP at CERN-Geneva, then with the RHIC at BNL-New-York and currently with the SuperKEKB at KEK-Tsukuba. As a specialist of silicon detectors, he focused during the last ten years on CMOS pixel sensors combining high granularity and high counting rates, which led to the first high-energy vertex detector based on this technology for the STAR experiment. The most recent developments in the Strasbourg CMOS sensors group open new applications outside particle physics, which require high energy or time resolution.

J.Baudot *et al.*, , Nucl.Instr.Meth. A 732 (2013) 480-483.
