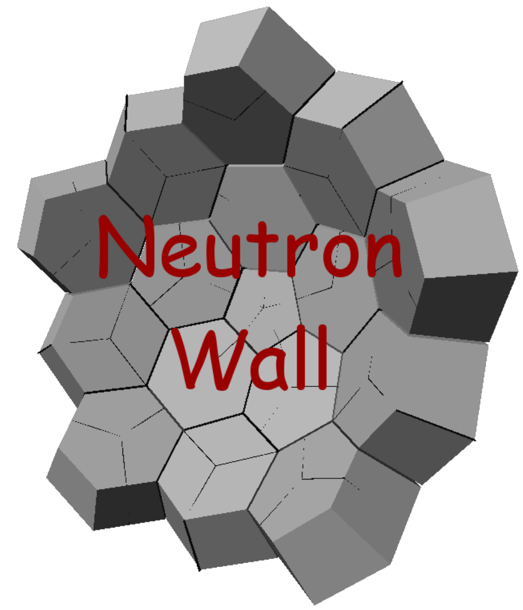
Status of

NEDA &



for AGATA campaign in 2018

Grześ Jaworski

on behalf of NEDA collaboration

AGATA Week, Orsay, October 6th, 2016

Outline

→ Mechanical structure.

→ Production of the detectors.

→ Electronics.

→ Time schedule.

GANIL 2018: AGATA + NEDA

M. Bentley: In beam gamma-proton coincidence spectroscopy in ^{65}As – isospin symmetry at the limits of proton binding. (+ DIAMANT) - 20 UTs

A. Boso: Isospin symmetry breaking and shape coexistence in mirror nuclei ^{71}Kr – ^{71}Br. (+ DIAMANT) - 20 UTs

B. Cederwall: Search for isoscalar pairing in ^{88}Ru. (+ DIAMANT) - 36 UTs

B. Fornal, S. Leoni & M. Ciemała: Gamma decay from near-threshold states in ^{14}C: a probe of clusterization phenomena in open quantum systems. (+ DIAMANT + DSSD + $LaBr_3$ + PARIS) - 22 UTs

S. Lenzi: Effects of Isospin Symmetry Breaking in the A=63 mirror nuclei. (+ DIAMANT) - 17 UTs

J. Nyberg: Studies of excited states in ^{102,103}Sn to deduce two-body neutron interactions, single-particle energies and N = Z = 50 core excitations. (+ DIAMANT) - 32 UTs

M. Palacz: Purity of the $g^{n}_{9/2}$ configuration based on lifetime measurements and energies of excited states in ^{94}Pd. (+ FATIMA) - 23 UTs

J.J. Valiente Dobon & E. Clément: Shell evolution of neutron-deficient Xe isotopes: Octupole and Quadrupole Correlations above ^{100}Sn. (+ DIAMANT + Plunger) - 32 UTs

202 UTs = 67 beam days

Detector production

Self production [hand made], using:

→ Detector vessels and PMT housings are made by welding flanges to hexagonal profiles;

→ EJ520 TiO_2 paint; TorrSeal; 5” 5mm BK7 glass;

→ Expansion bellow – ΔT = 40 K;

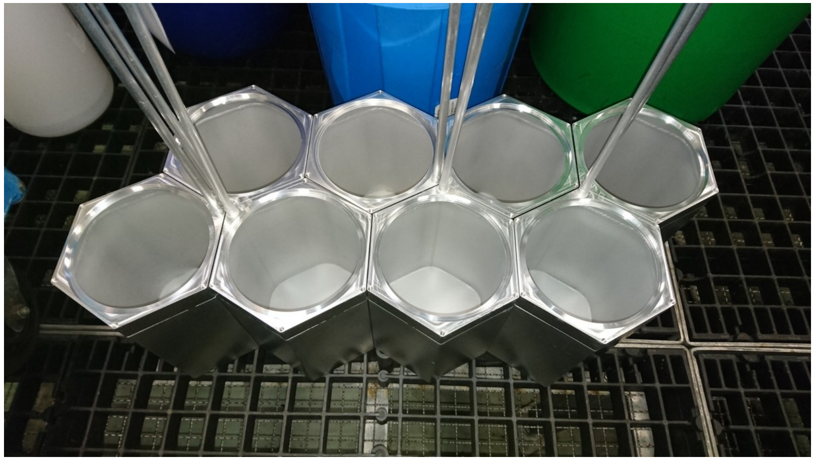
→ EJ301 (BC501) liquid scintillator.

→ SBA R11833-100HA 5” PMT (32% Q.E.)

→ custom transistorized VD provided by Świerk

→ mu-metal shielding (1 mm)

→ Array structure (design on the final state)



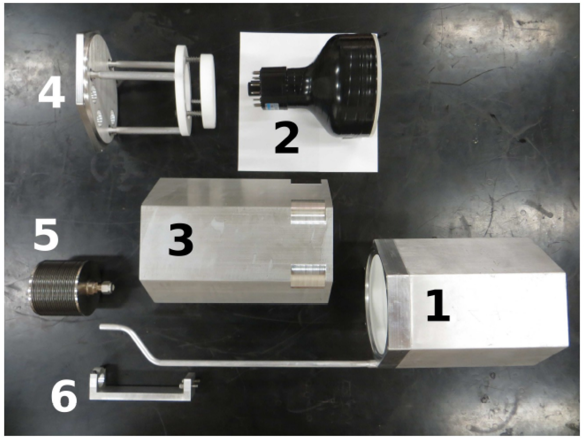


Fig. 1. Elements used for the construction of the NEDA detector: detector cell, with extension pipe (1); PMT (2); PMT housing (3); PMT pusher (4); the bellow (5) and the support for the bellow (6).

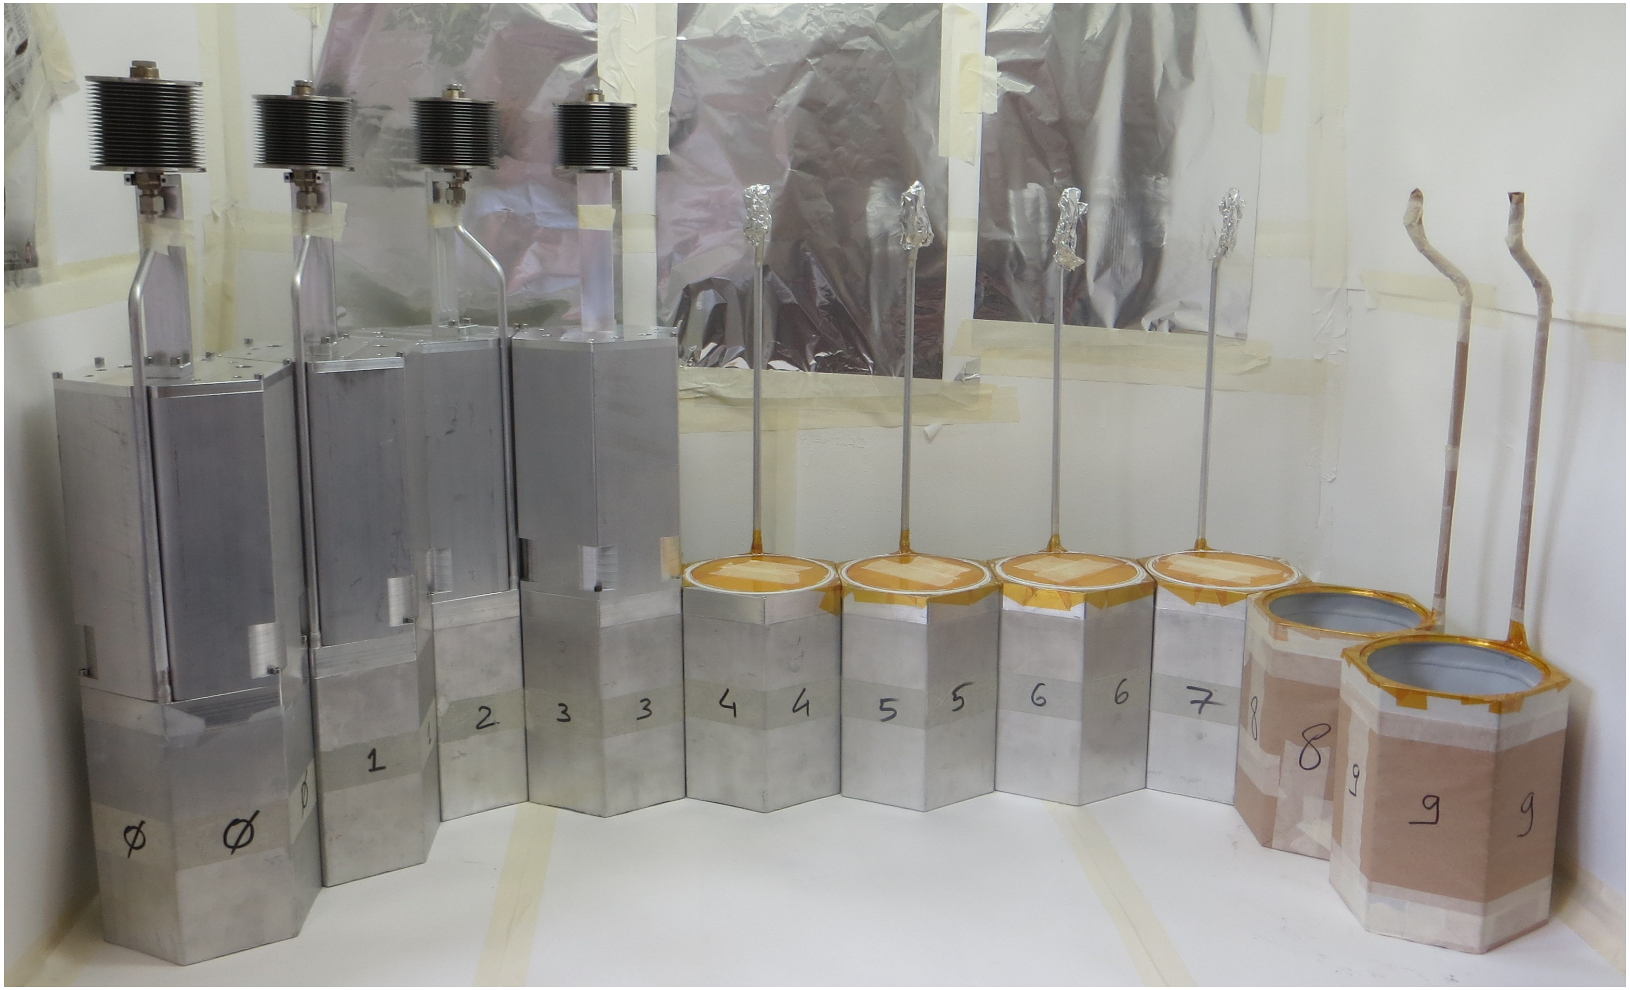
Detector production

Detector production

Detector production



Production – current status

- → 8 detectors finished (2400-2600 phe/MeVee);
- → 4 detectors under vacuum-tightness test;
- → 4 vessels prepared to be painted;
- → 16 vessels after etching;
- → 24 vessels to be delivered soon;
- → 7 vessels for machining.

Have:

- → 99.5 litre of EJ301;
- → 7 litre of paint;
- → 472 g of the glue;
- → 52 glass windows;
- → 7.65 kg of the grease.
- → 52 PMTs;
- → 55 (+20) VDs.

Production – current status

→ 8 detectors finished (2400-2600 phe/MeVee);
→ 4 detectors under vacuum-tightness test;
→ 4 vessels prepared to be painted;
→ 16 vessels after etching;

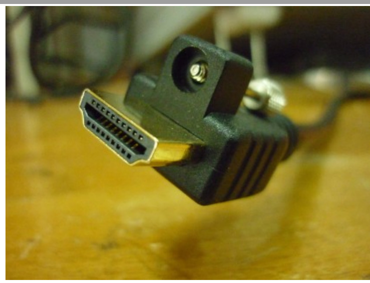
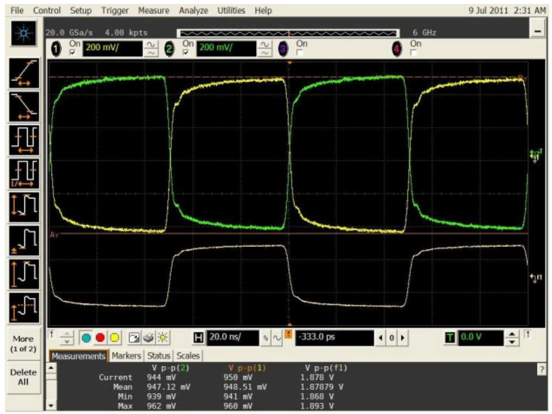
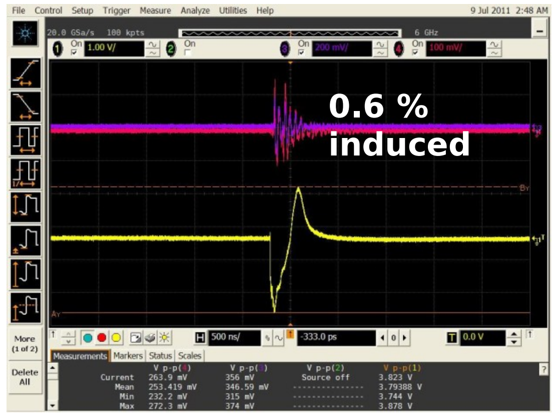
HDMI NEDA cables

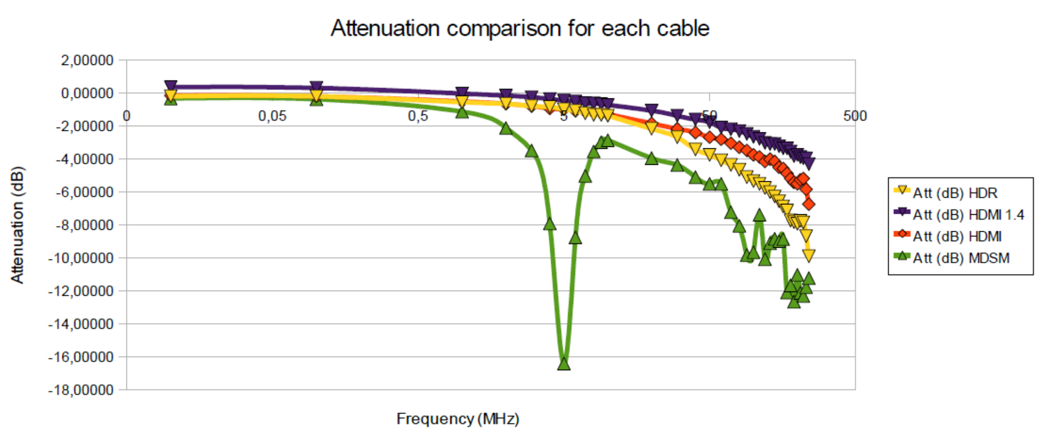
X. Egea (LNL), M. Tripon (GANIL), M. Jastrząb (Kraków)



- Several tests have been applied to different cables in order to test their performance.
- Among them we may mention the bandwidth, crosstalk, impednace and reflections, and EMC (electromagnetic compatibility).
- On the picture on the left it is shown the **HDMI cable.**
- The HDMI 1.4 version, including a double shield, makes an important improvement against high-voltage peaks.







- Top → (From left to right): Crosstalk, reflections and EMC measurements. Bottom → Bandwidth
- The HDMI 1.4 has a big <u>stiffness</u> and it might be a little bit problematic mechanically.

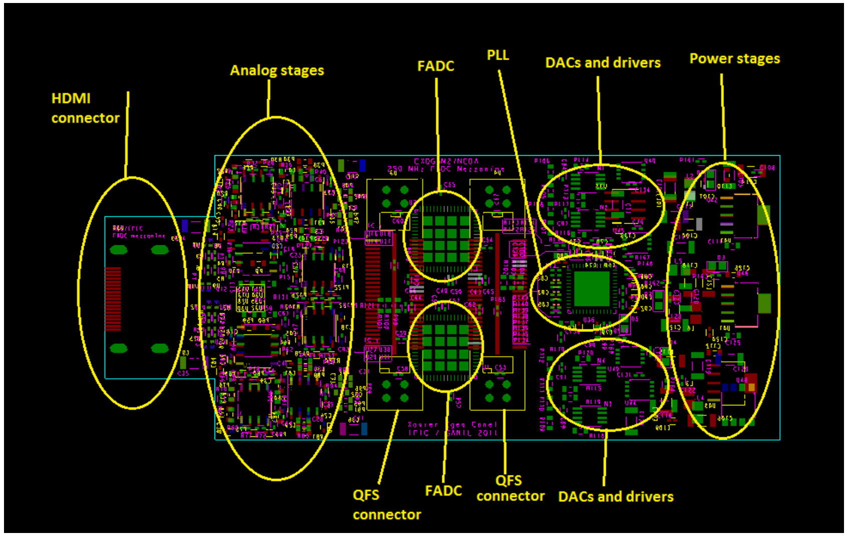
Backup slides follow

FADC Mezzanine

X. Egea and A. Gadea (IFIC,CSIC, Valencia)



- **4-channel acquisition with a sampling rate of 250 Msps and 14-bit resoltion.**
- Use of a PLL for jitter cleaning and clock synchronization
- 6 W power consumption at 250 MHz.
- Possibility to use a variable offset by using a 16-bit digital-to-analog converter.
- Includes 2 QFS-026-04,75-LD-PC4 connectors, and thorugh them, differential signals, control lines and power lines are transmitted by using the same connector.
- Includes an HDMI PCB receptacle, which will link the front-end electronics with the FADC mezzanine.

- 10 layers have been used in order to make possible this design by using high-speed layout techniques.
- The FADC follows an easy and straigthforward placement and routing. Besides, symmetry has been provided in order to make an easier design.
- The board dimensions fit on the NIM standard, where 4 of these will be inserted into the crate. (42mm wide + 98.5 mm long)
- Most of the QFS lines are linked to the

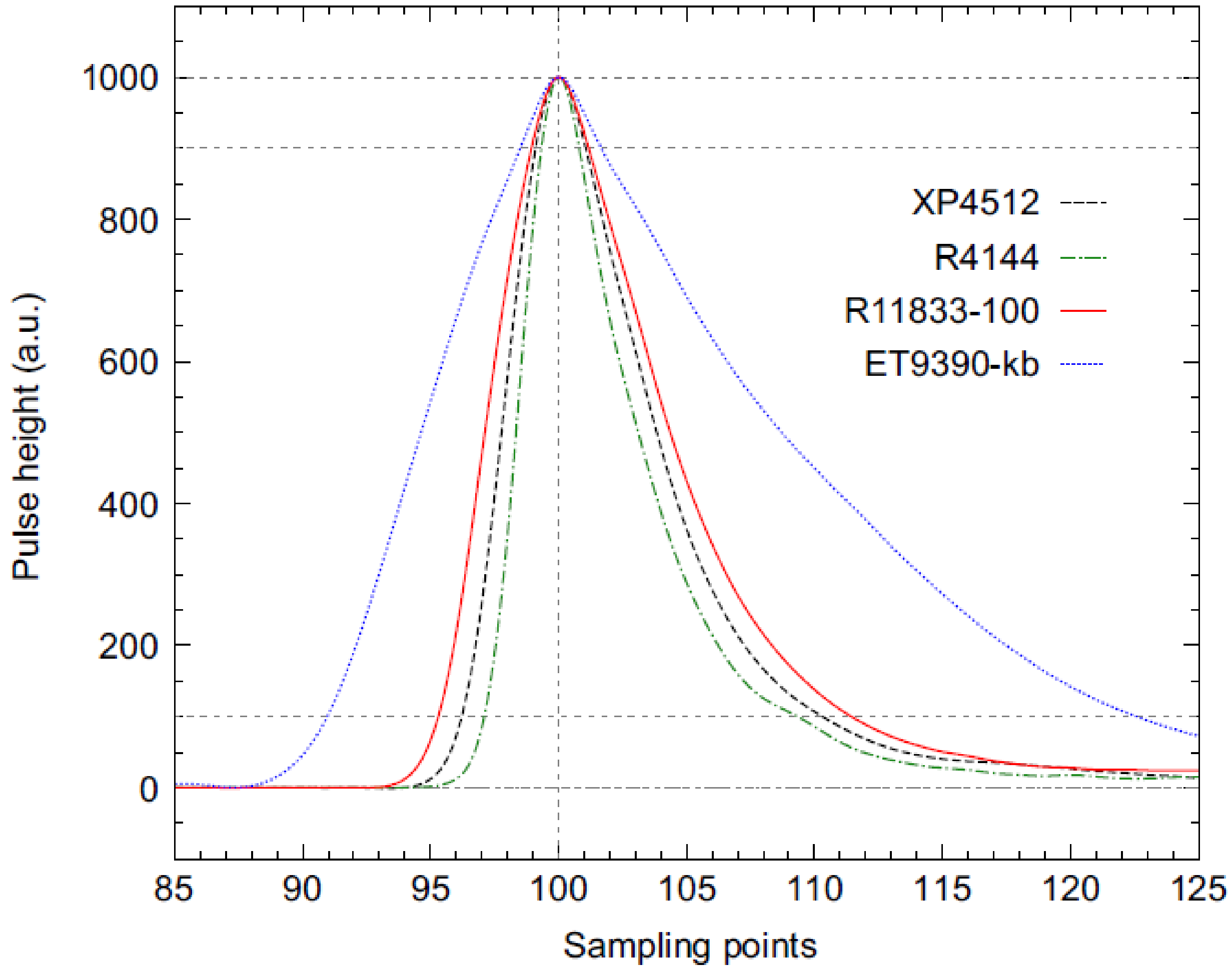

Fig. 2. Digitized waveforms averaged over 10^5 events for the four 5 in. PMTs coupled to a cylindrical 5 in. by 5 in. BC501A. The sampling frequency of the digitizer was 500 MS/s. The waveforms were normalized to a pulse height of 1000 and time aligned at the maximum of the signal. Dashed lines are drawn at 10%, 90%, at the maximum and at the baseline of the waveform to guide the eye.

Aim of NEDA

- Develop a neutron detector array to be used with AGATA, EXOGAM2, GALILEO, PARIS, etc., for experiments with high intensity stable and radioactive ions beams at SPES, SPIRAL2 and at other facilities.

The array should have:

→ Increased neutron detection efficiency compared to Neutron Wall: $\varepsilon(1n) \approx 40\%$ (20-25%), $\varepsilon(2n) \approx 6\%$ (1-3%), $\varepsilon(3n) \approx 1\%$ (0.1 %)

→ Excellent neutron-gamma discrimination.

→ Superiour 1n/2n/3n discrimination.

→ Capability to run at much higher count rates than current arrays.

→ Cope with large neutron multiplicities in reactions with neutron-rich RIBs.

→ Improved neutron energy resolution for reaction studies.

Is it worth the effort ?

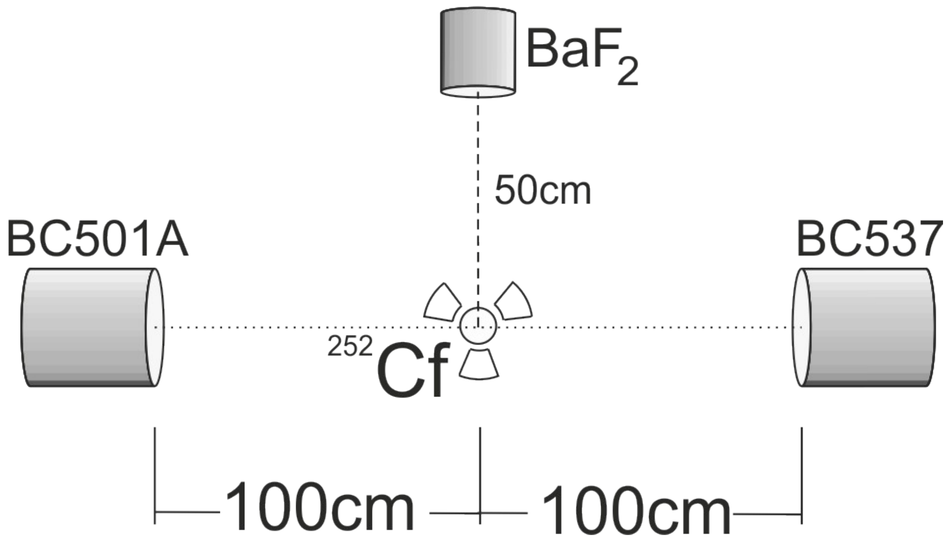
$\varepsilon(1n) \approx 40\%$ (20-25%), $\varepsilon(2n) \approx 6\%$ (1-3%).
$\varepsilon(3n) \approx 1\%$ (0.1 %)

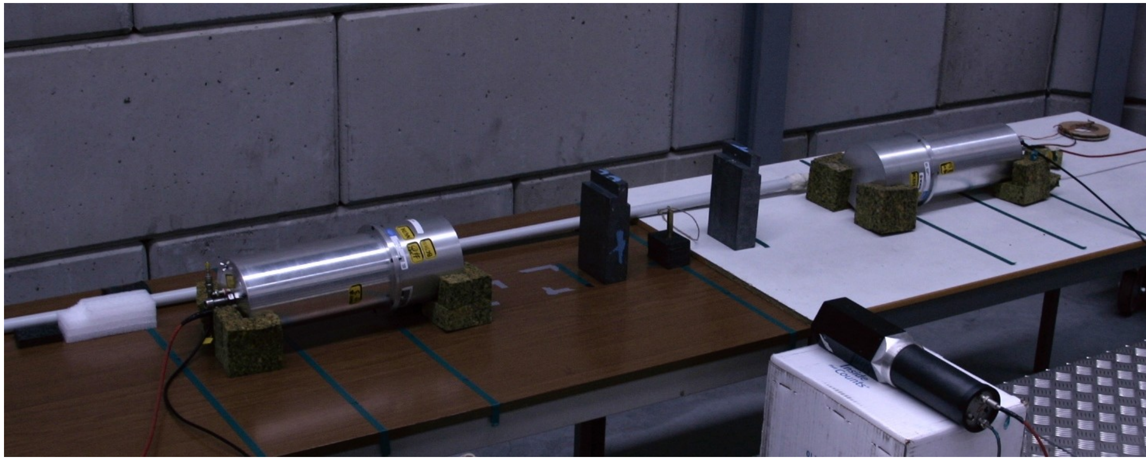
- The primary application of NEDA is to act as neutron multiplicity filter in γ-ray fusion-evaporation studies of very neutron deficient nuclei, close to N=Z
  - probe of T=0 correlations (like ^{92}Pd)
  - ^{100}Sn region: SPE, nucleon-nucleon interactions and core excitations
  - Coulomb Energy Differences in isobaric multiplets, T=0 vs. T=1 states
  - Low-lying collective modes (proton pygmy dipole resonance, $^{34}Ar + ^{16}O \rightarrow ^{44}Cr + \alpha 2n$, with PARIS)
- The power of the new neutron detector can be especially demonstrated in studies in which detection of 2 or more neutrons is required

Tests of NEDA prototype detectors

Legnaro

- 5x5 inch cylinders
- BC501A and BC537 – 2 of each type
- Photonis XP4512
- Struck SIS3350 (500 MHz, 12 bit)
- VME-based DAQ system by J. Agramunt-Ros
- BaF_2 for time reference



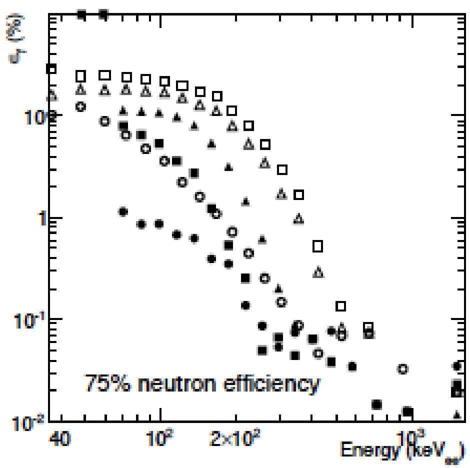


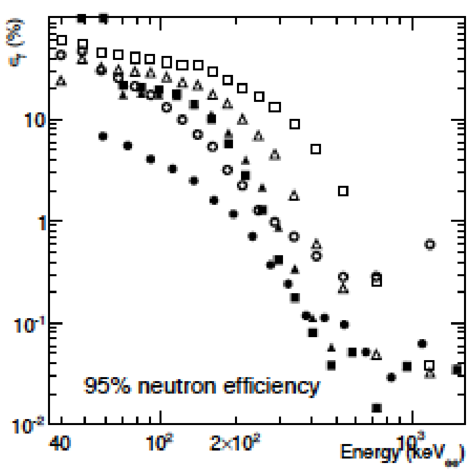
NEDA tests: digital neutron/γ discrimination

P.-A. Söderström (RIKEN, Nishina, Japan; Uppsala University, Uppsala, Sweden)

Figure of merit: ϵ_γ = fraction of γ rays mis-identified as neutrons.

NIM draft





Shown in plots:

- y-axis: ϵ_γ = fraction of γ rays identified as neutrons.
- x-axis: energy deposited in the detector in units of keV$_{ee}$ (keV electron-equivalent).
- Top (bottom) figure: 75% (95%) of the neutrons remain after neutron-gamma discrimination.
- Filled (open) symbols: BC501A (BC537)
- Digital neutron-γ discrimination methods:
  - Circles: Artificial neural network
  - Triangles: Integrated rise-time
  - Squares: Charge-comparison

Conclusions:

- ANN is best in particular at small energies.
- BC501A is better than BC537.

Conclusions on deuterated vs proton-based scintillator

→ better light to energy correlation for deuterated scintillator only for small detectors – not NEDA case.

Proton-based BC501A:

→ gives more light;

→ has higher efficiency;

→ has better time resolution;

→ has better n/γ discrimination;

→ has smaller scattering probability ($p_{1n\text{->}2n}$);

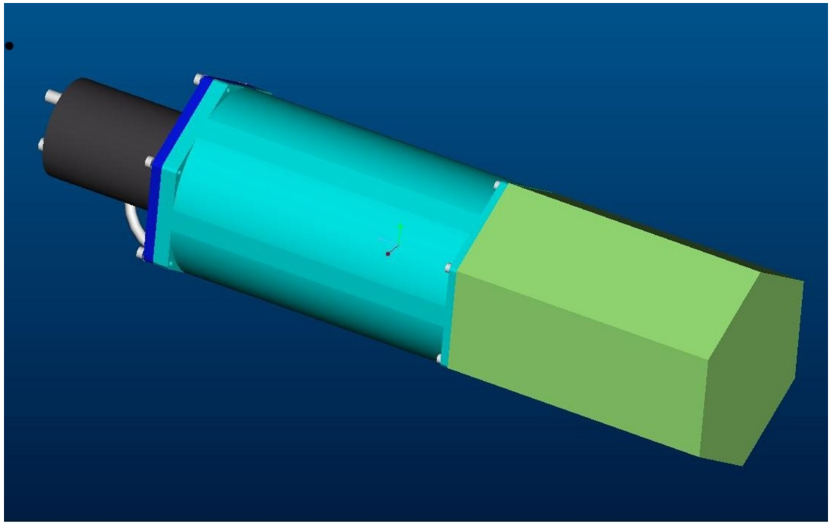
→ is much less expensive.

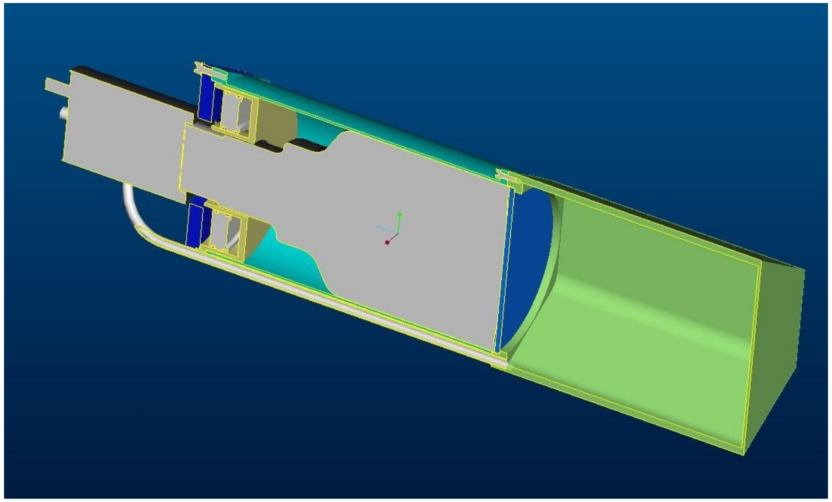
NEDA decided to use standard proton based scintillator

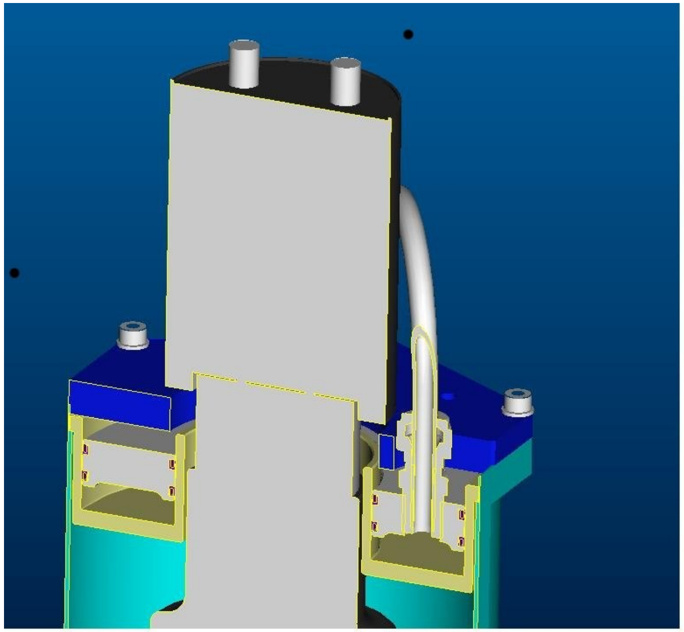
Design of a NEDA detector

ϕ = 127 mm - PMT diameter

L = 200 mm - length



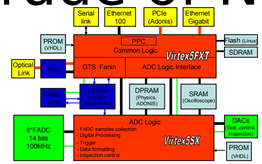


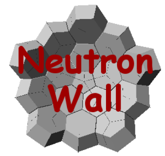


drawings by Nicola Lollo

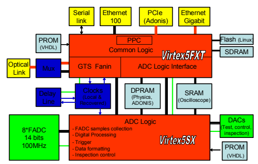
Phases of NEDA

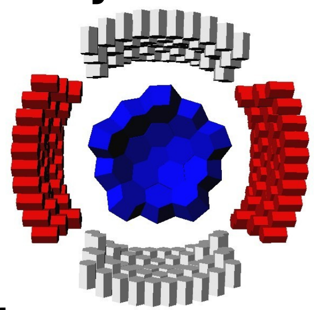
- Phase 0: Upgrade of NWall electronics (going digital)





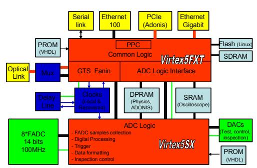
- Phase 1: Construction of 1π array, combined with NWall

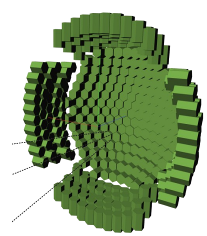




MoU (4 years) signed in March 2012

- Phase 2: Final construction of 2π array, 355 detectors





- Phase 3: R&D on new material and light readout systems for a highly segmented neutron detector array.

full NEDA ~ 1.3 MEuro

Summary and outlook

→ NEDA will be a neutron detector array to address the physics of neutron-rich and neutron-defficient nuclei in conjuntion with γ-ray arrays like EXOGAM2, AGATA, GALILEO, PARIS.

→ Geant4 simulations:
- model validated;
- optimal size of detector units: 20 cm length, 5" diameter;
- BC501A better then BC537 for our needs;
- conceptual design: staircase geometry, 2Π, r = 1.0 m, 355 units.

→ experimental tests BC501A and BC537: proton based better: efficiency, NGD.
→ self production of the cells.
→ development of electronics in synergy with EXOGAM2 and PARIS.
→ NEDA will be built in phases: MoU signed in March 2012.

→ work on digital PSD, multiplicity identification and timing algorithms in progress.
→ mechanical design of detector units in progress.

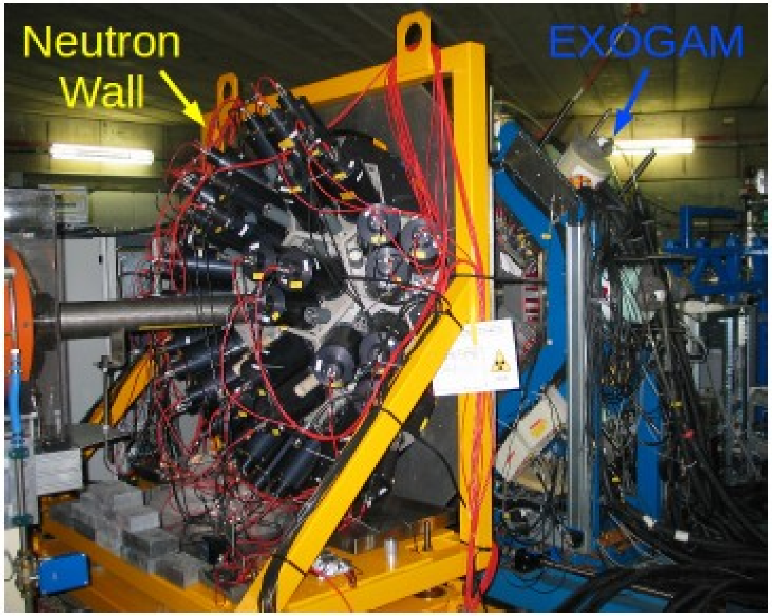
Neutron Wall

Experiments performed with EUROBALL at LNL (1998) and at IReS (2001-2003), and with EXOGAM at GANIL (2005-).

Combined with charged particle detector arrays (EUCLIDES, DIAMANT, CUP, . . .).



GANIL home base since 2005.

Four experimental campaigns at GANIL with EXOGAM + DIAMANT and other detectors (2005-2009).

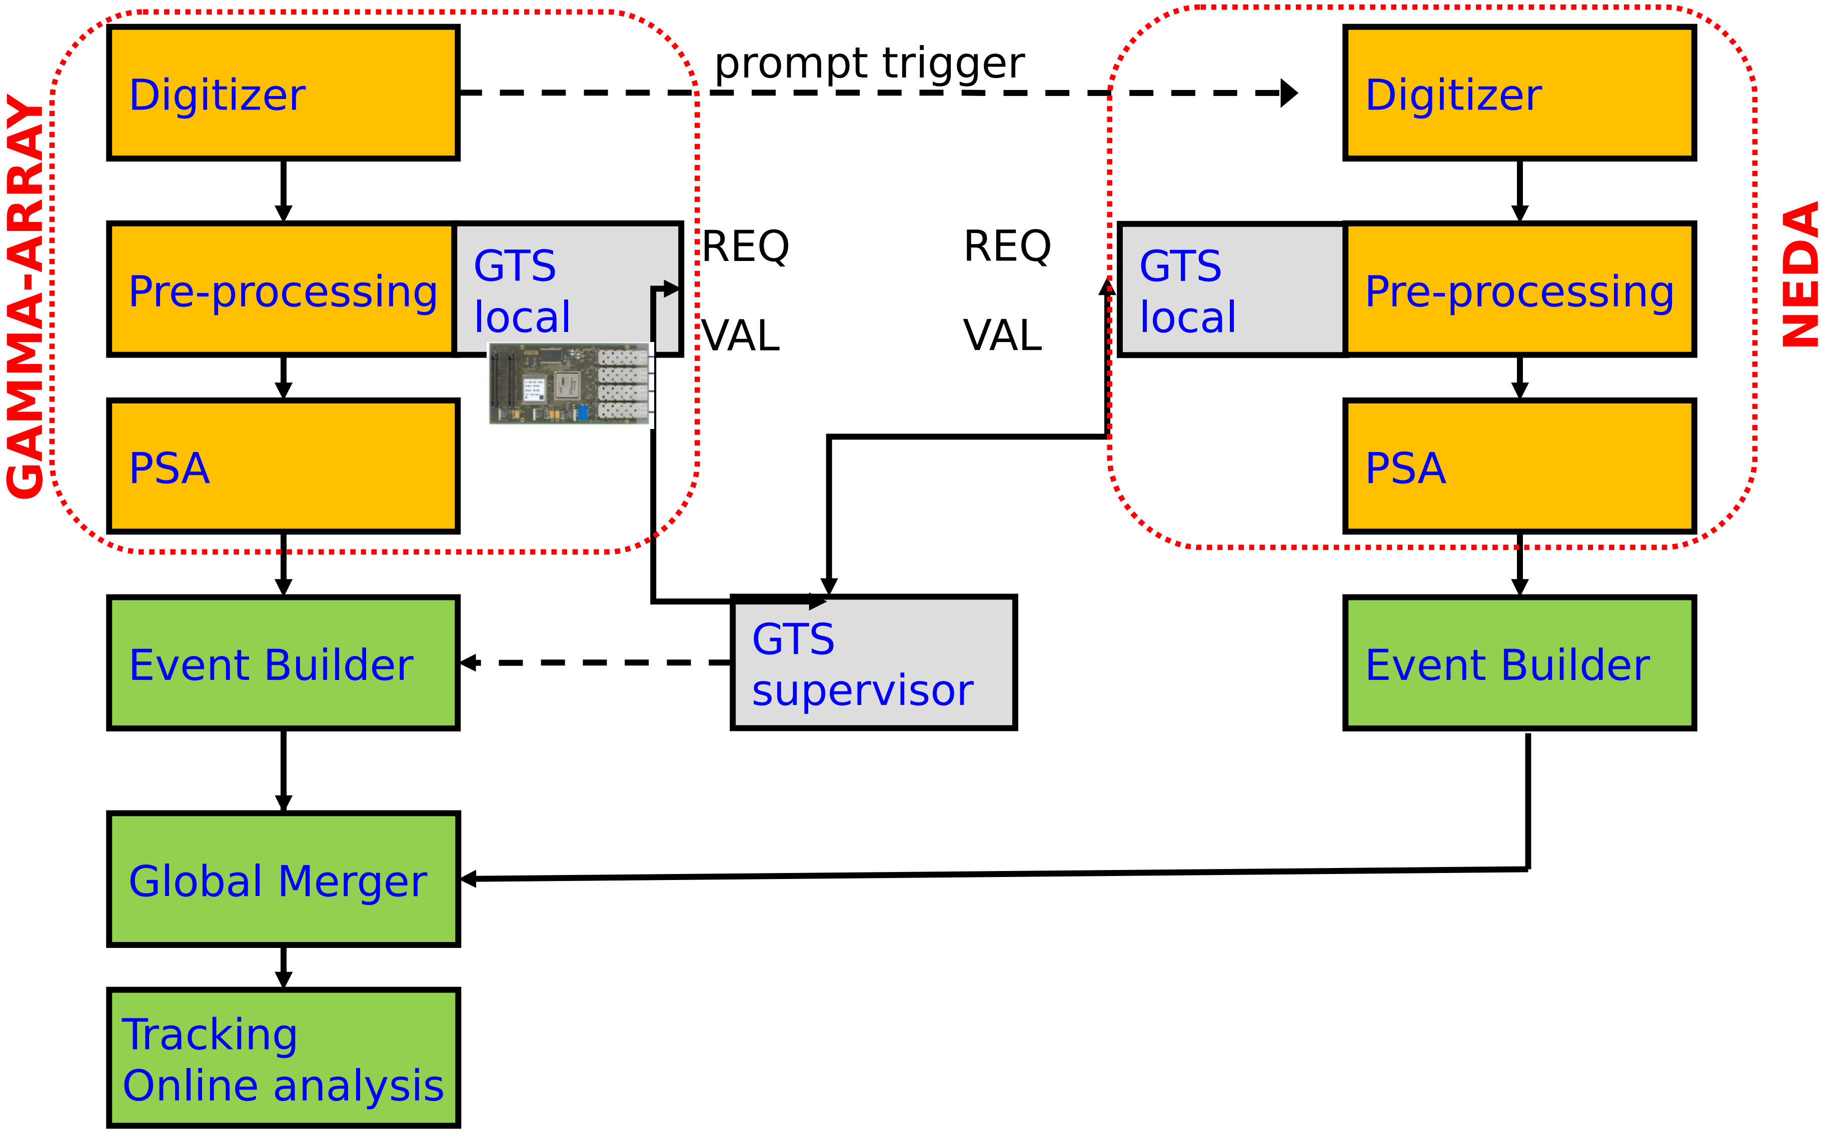
Next campaign (two experiments): GANIL 2012.

Physics with NEDA

NEDA will address the physics of neutron-rich as well as neutron-deficient nuclei, mainly in conjunction with gamma-ray detector arrays like AGATA, GALILEO, EXOGAM2 and PARIS.

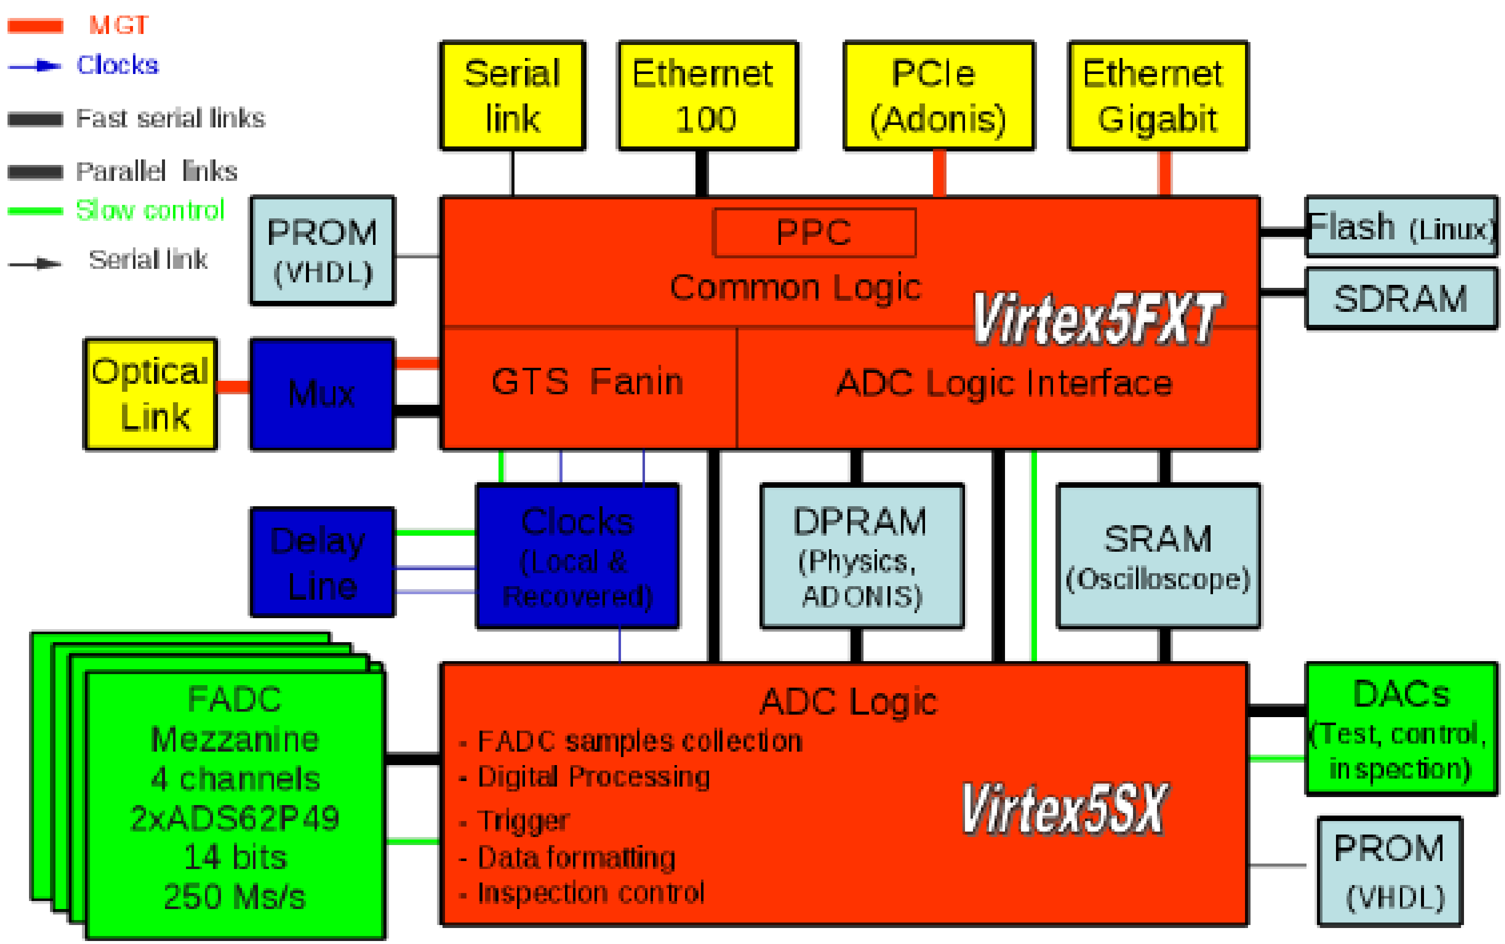
- **Nuclear Structure**
  - Probe of the T=0 correlations in N=Z nuclei: the structure beyond ^{92}Pd (Uppsala, LNL, Padova, GANIL, Stockholm, York)
  - Coulomb Energy Differences in isobaric multiplets: T=0 versus T=1 states (Warsaw, LNL, Padova, GANIL, York)
  - Coulomb Energy Differences and Nuclear Shapes (York, Padova, GANIL)
  - Low-lying collective modes in proton rich nuclei (Valencia, Krakow, Istanbul, Milano, LNL, Padova)
- **Nuclear Astrophysics**
  - Element abundances in the Inhomogeneous Big Bang Model (Weizmann, Soreq, GANIL)
  - Isospin effects on the symmetry energy and stellar collapse (Naples, Debrecen, LNL, Florence)
- **Nuclear Reactions**
  - Level densities of neutron-rich nuclei (Naples, LNL, Florence)
  - Fission dynamics of neutron-rich intermediate fissility systems (Naples, Debrecen, LNL, GANIL)

NEDA coupled to
AGATA/GALILEO/EXOGAM2/PARIS



Digital electronics: EXOGAM2-NEDA-PARIS

NUMEXO2

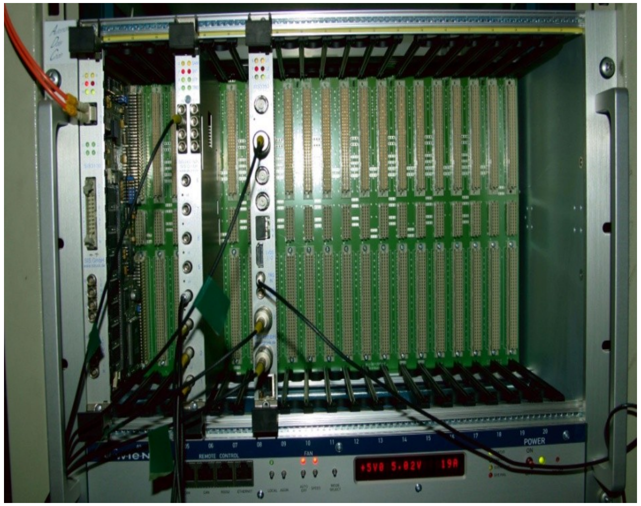


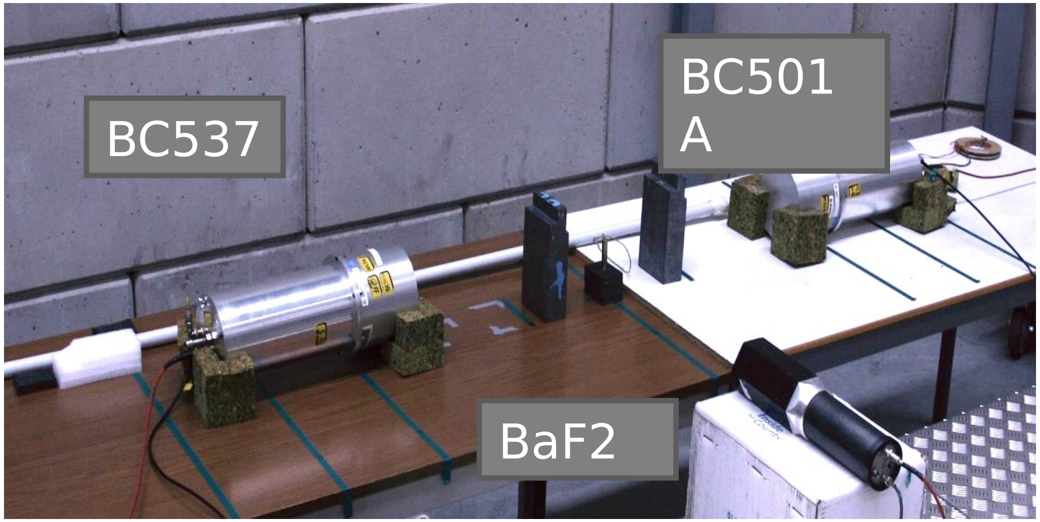
NEDA test setup

The tests are being performed at LNL with the following instrumentation:

- 2 x BC501A (5” x 5” cylindrical prototype detector)
- 2 x BC537 (5” x 5” cylindrical prototype detector)
- SIS3302 100 MS/s, 16 bits 8 ch. digitizer (analog setup)
- SIS3350 500 MS/s, 12 bits 4 ch. digitizer
- DAQ by IFIC, J. Agramunt

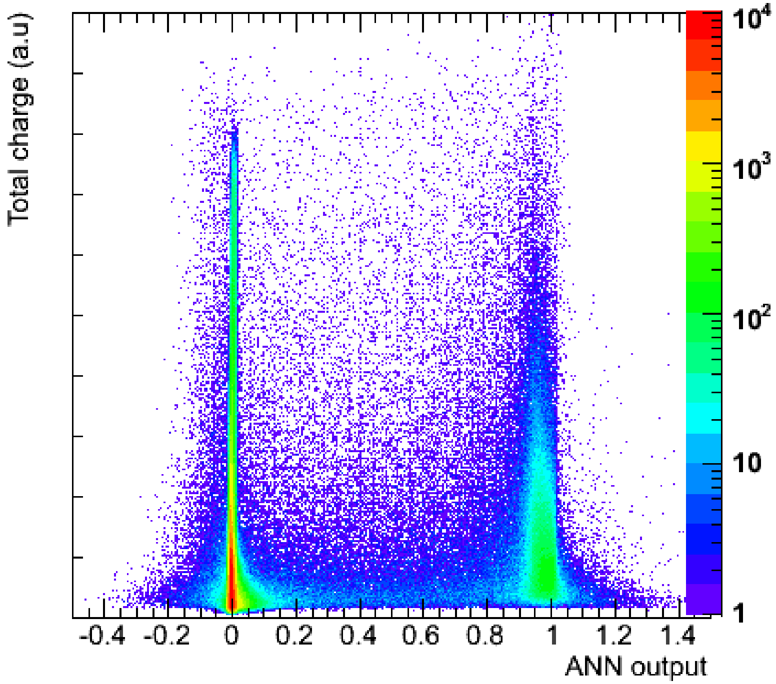
- Digital PSA
- Relative efficiency performance
- Cross-talk between the detectors

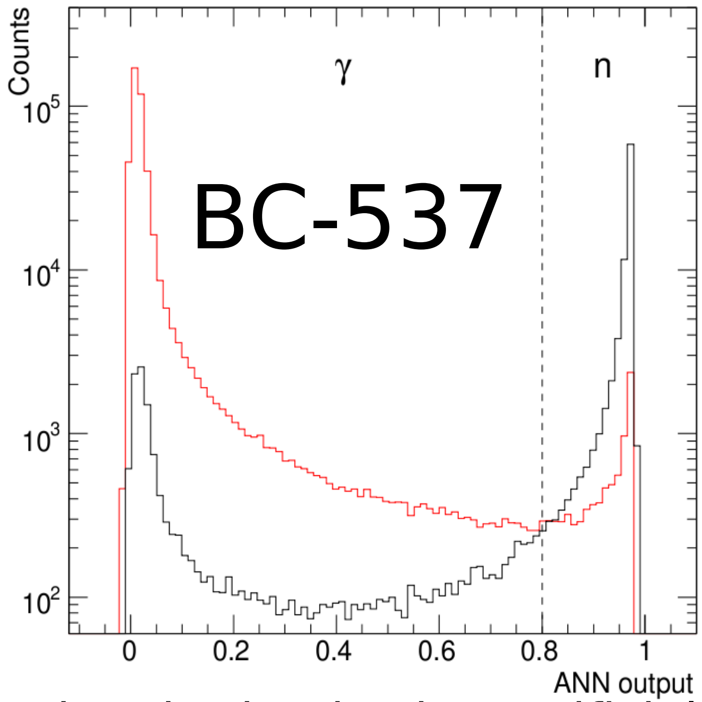




NEDA test: PSA Neural Network

P.-A. Söderström(Uppsala University, Uppsala, Sweden)





Full advantage of digital electronics can be obtained using artificial neural networks to perform pulse-shape discrimination. This method is currently being investigated both for BC537 and BC501A.

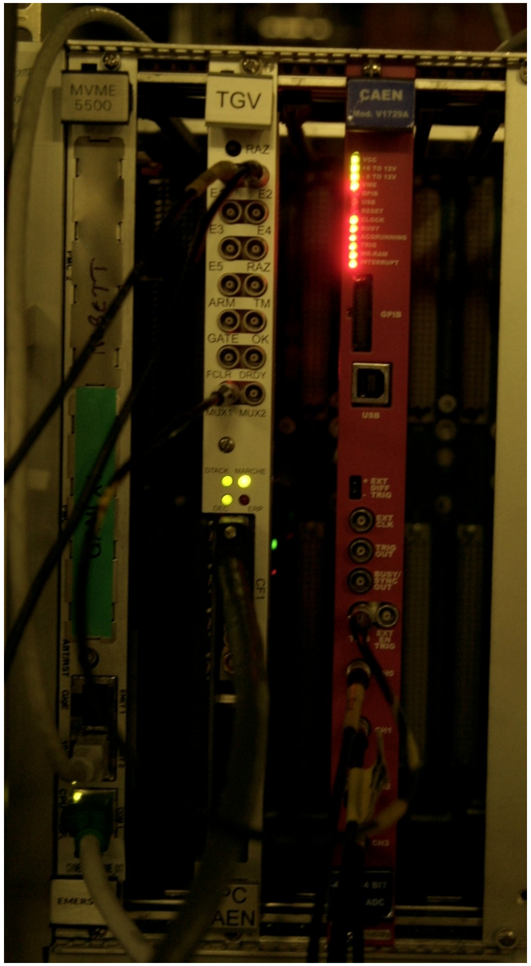
+ Optimal discrimination over a large ene

- Slower implementation limits counting ra

Monday and Thursday talk by G. Jaworski

In beam test with the NW

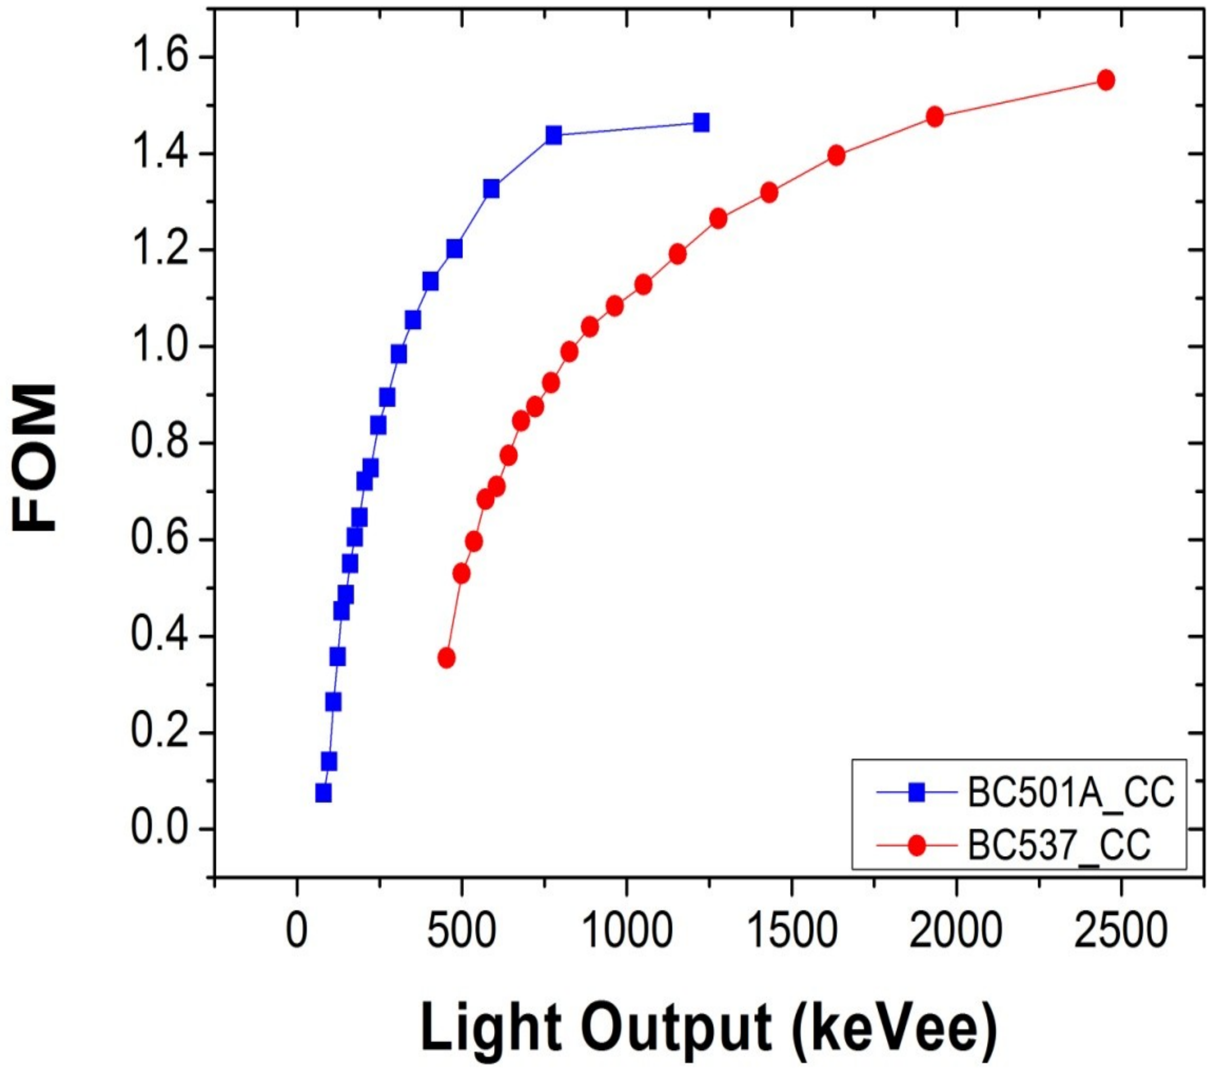
- First in-beam waveform taking (two weeks ago @GANIL)
- 124 MeV ^{40}Ca onto ^{58}Ni 6 mg/cm2 and ^{12}C 0.5 mg/cm2
- PSA algorithms
- MATACQ digitizer, 1GS/s, 14 bit



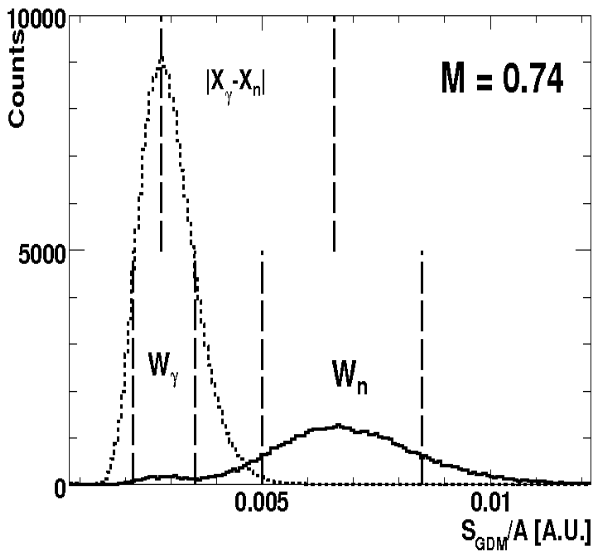
With current technological status …

- Three main options:
  - 200 detectors BC501A – PM readout –Digital electronics
    - Total cost: 600K€ (BC501A) + 200K€(Elec.) + 40K€ (mechanics) = 840 K€
  - 200 detectors BC537 – PM readout – Digital electronics
    - Total cost: 2000K€ (BC537) + 200K€(Elec.) + 40K€ (mechanics) = 2240 K€
  - Upgrade Neutron Wall - Phase 0 (Digital electronics)
    - Total cost (50 channels) = 40K€

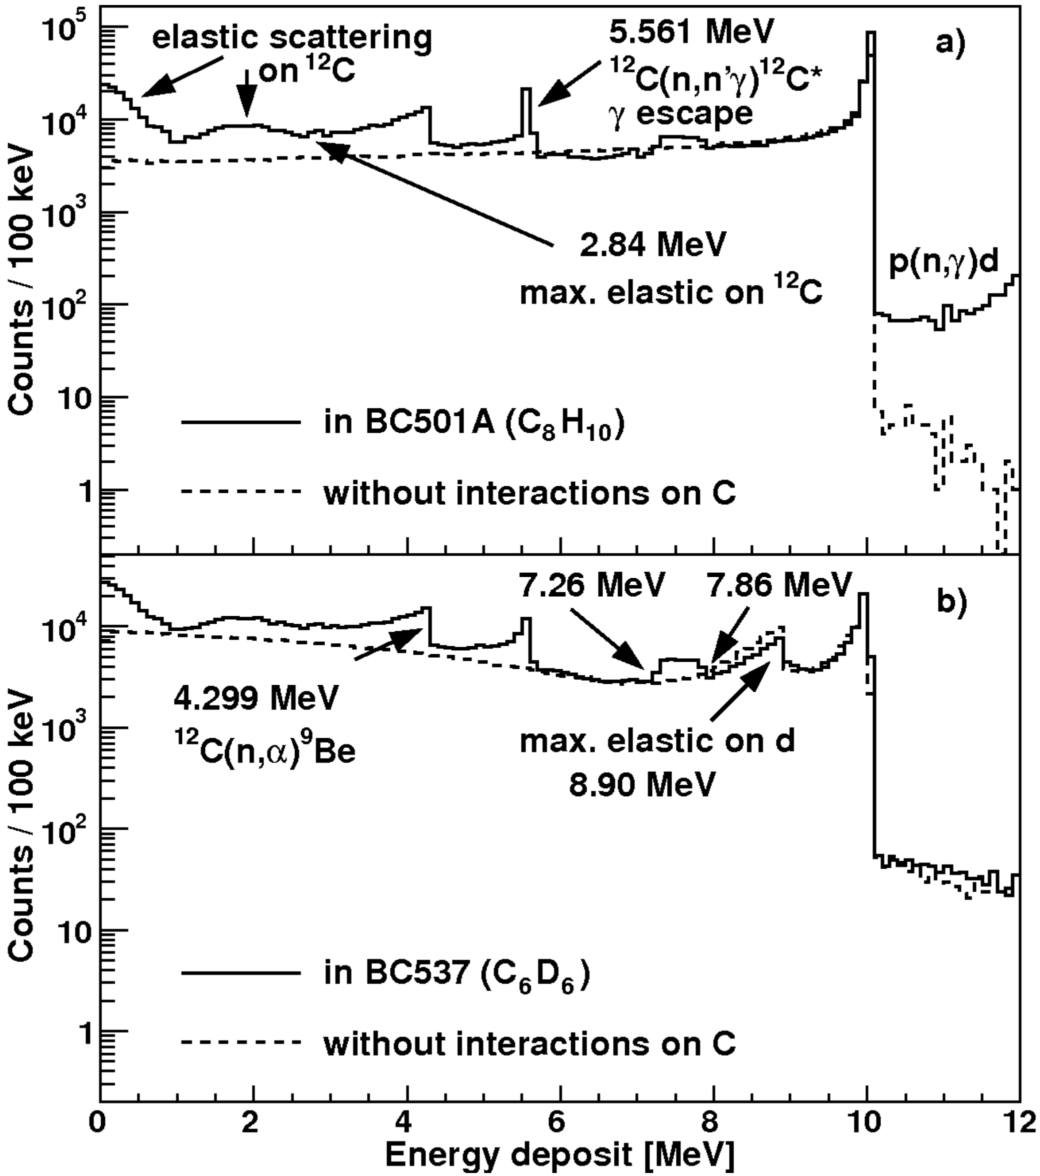
NEDA test: PSA Charge Comparison

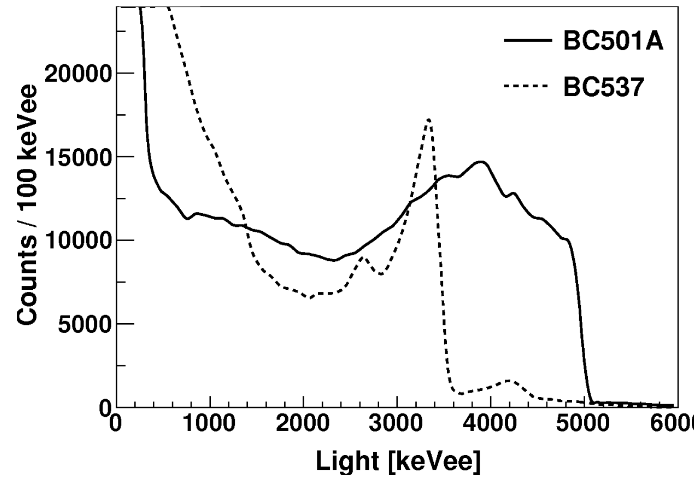


$$M = \frac{|X_\gamma - X_n|}{W_\gamma + W_n}.$$



Interactions of neutrons in the scintillator





G.Jaworski et al. NIM A673 (2012) 64

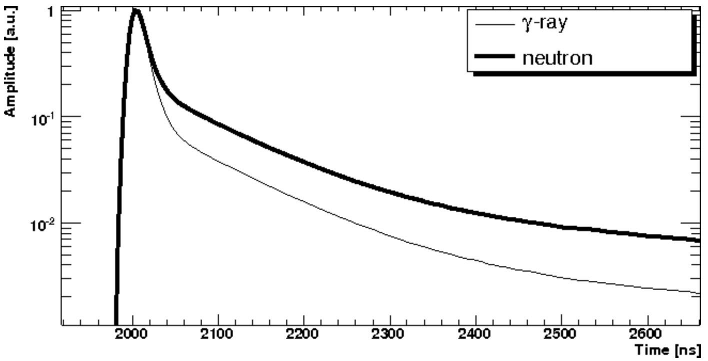
Neutron – gamma discrimination

Liquid scintillators give a difference in signal pulse shapes for neutrons and gamma rays:

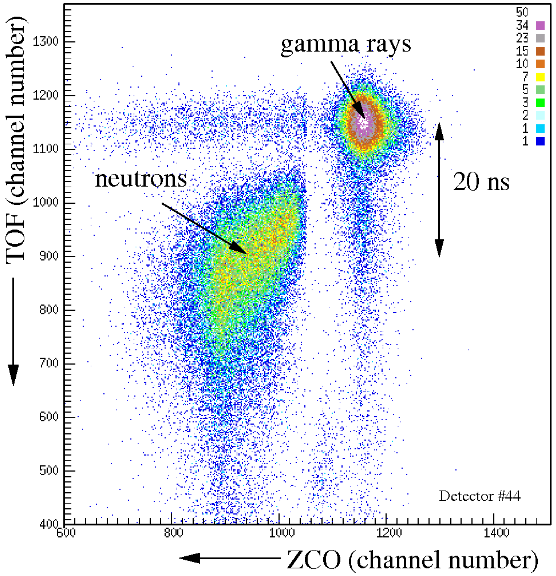
- neutrons (recoiling protons) - slow light component (τ~300 ns)
- γ rays (electrons) - fast light component (τ~3 ns)

Pulse shape combined with TOF gives w γ-ray as neutron interpretation probability ~0.1 %.

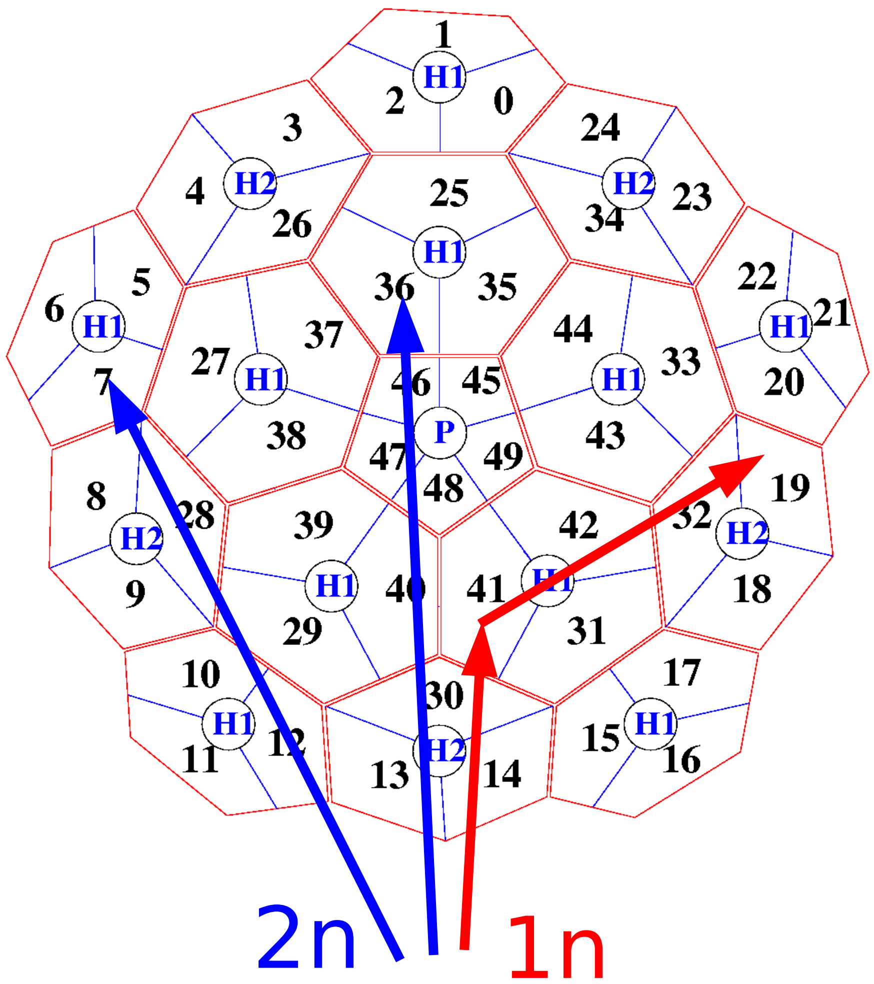
Present NWall: pulse shape discrimination analog.
NEDA will use digital techniques.



plot by P.-A. Soderstrom

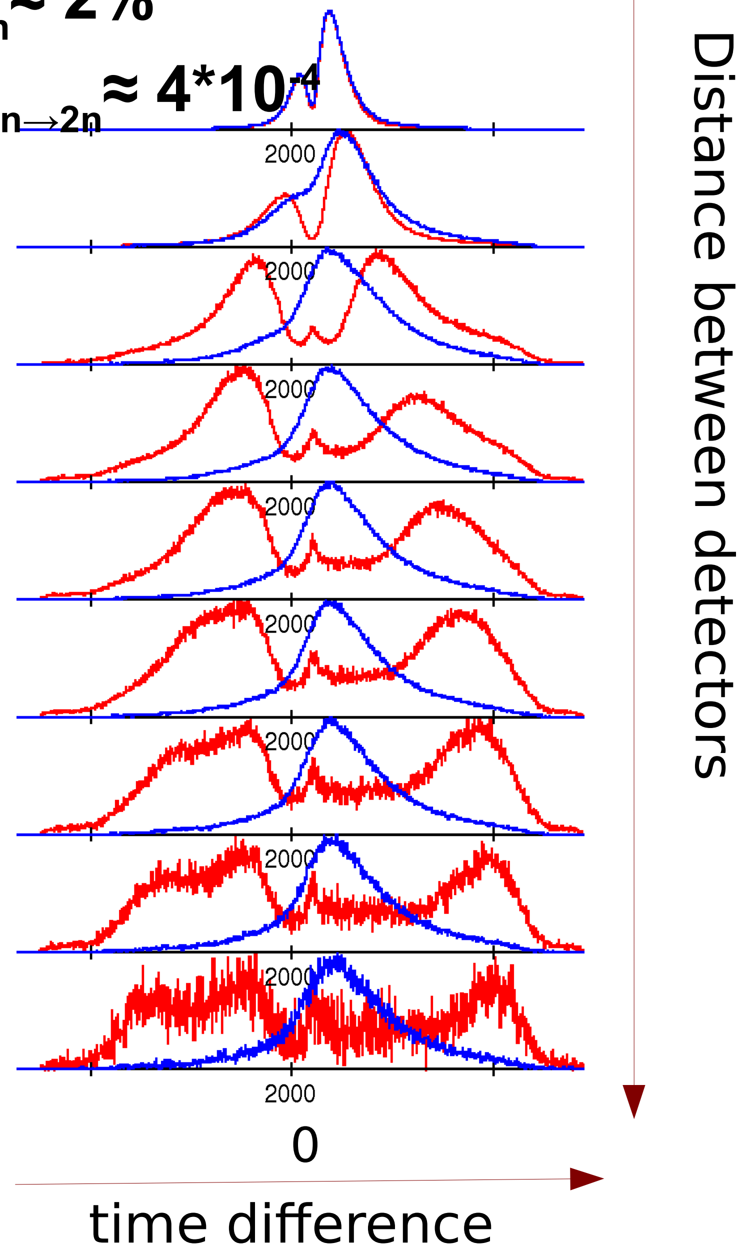


1n/2n/3n discrimination



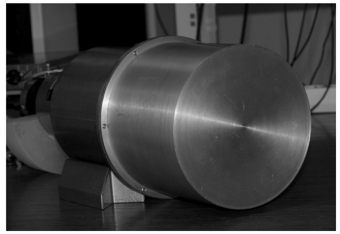
$\varepsilon_{2n} \approx 2\%$

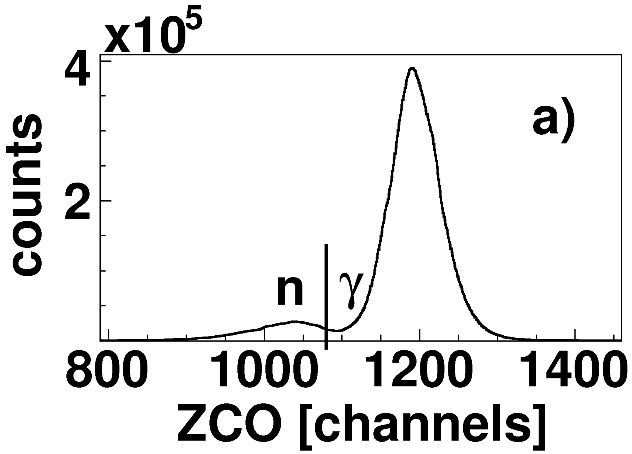
$P_{1n \rightarrow 2n} \approx 4 * 10^{-4}$

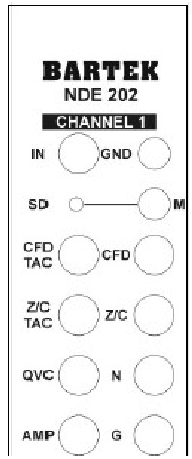


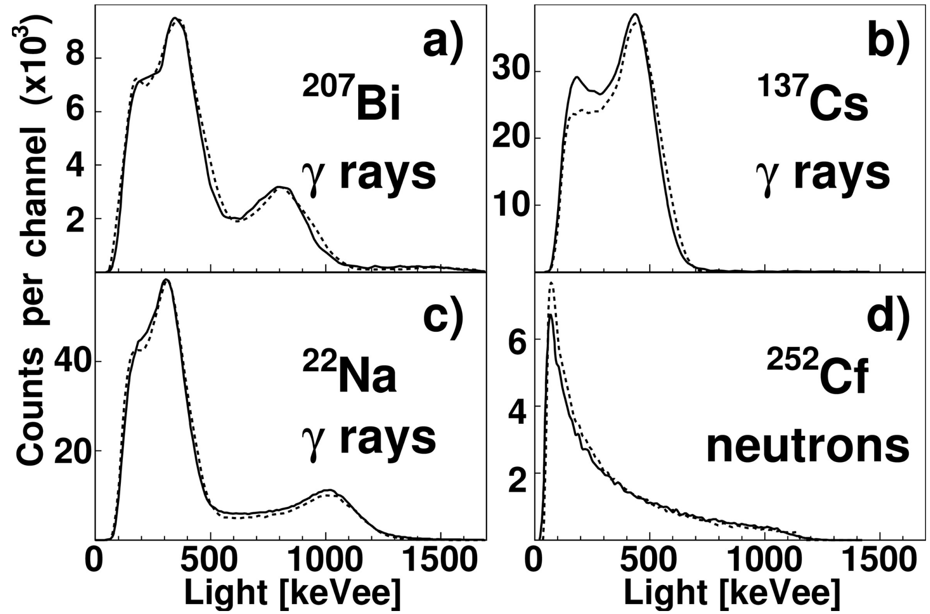
J. Ljungvall et al. NIM A528 (2004) 741

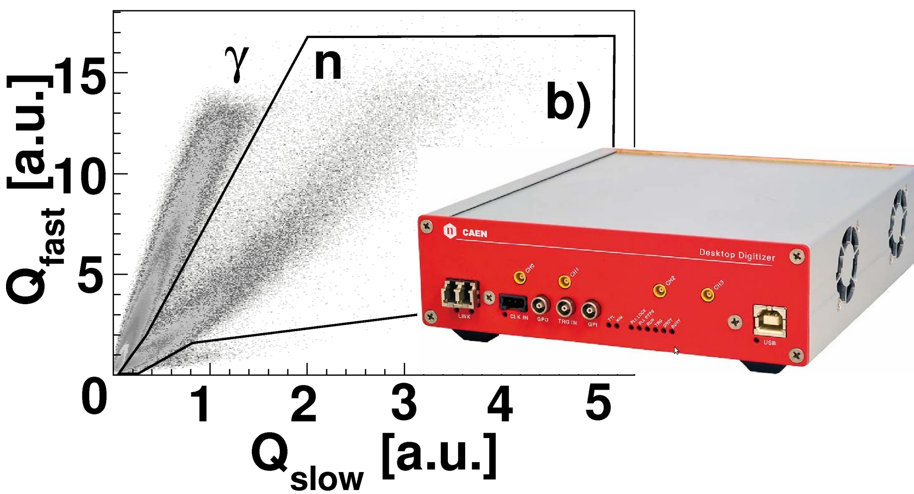
Validation of the simulations











Detector and radioactive source	Efficiency (%) Absolute Exp.	Sim.
NORDBALL:		
^{137}Cs γ rays, 50 cm	0.30(1)	0.285(1)
^{252}Cf neutrons, 51 cm	0.174(9)	0.241(2)
Cylindrical:		
^{252}Cf neutrons, 5 cm	6.1(3)	6.64(2)

Geant 4 simulations

Light to energy dependence

Light output for 2 MeV neutrons
Instrumental response function included
