

# Electroweak precise measurements @ the Tevatron

Liang HAN

University of Science & Technology of China (USTC)  
for the D0 and CDF collaborations

# Motivations

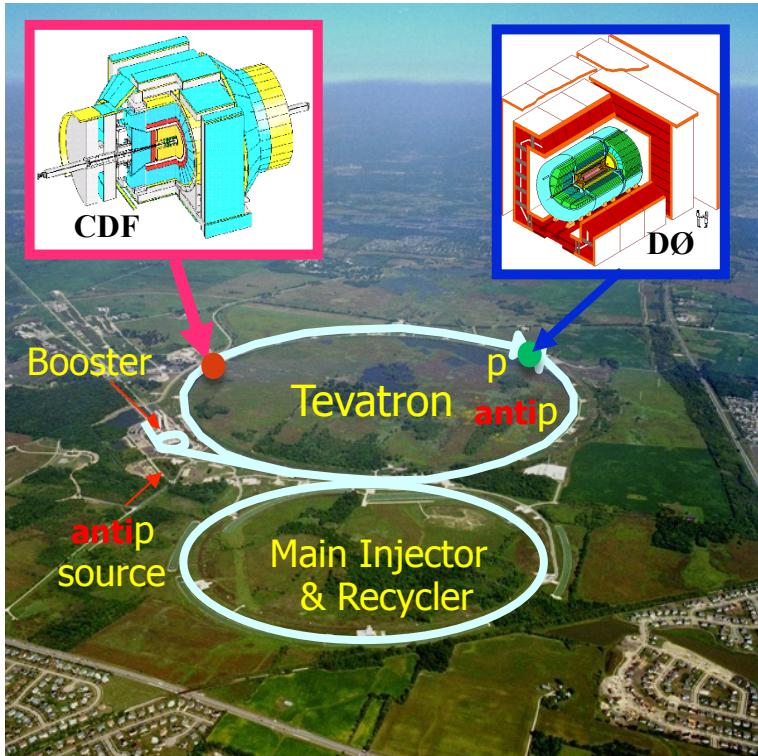

- Consistency tests of electroweak and symmetry breaking mechanism

Over-constrained parameters:

$$\alpha_{\text{em}}, G_F, M_Z, M_W, \sin^2\theta_W, m_{\text{top}}, M_H$$

# Tevatron @ Fermilab

- Collider: proton-antiproton

	c.m.s energy (TeV)	integrated L ( $\text{fb}^{-1}$ )
Run I (1992-1996)	1.8	$\sim 0.1$
Run II (2001-2011)	1.96	$\sim 9.7$

- Experiments: **CDF** and **DØ**

- General purpose detectors with large coverage and good performance of vertex, tracking, calorimeter and muon spectrometers
- Physics topics cover B, EW, top, Higgs, QCD and new physics searches as SUSY

# The W mass @ Tevatron

- Strategy:
  - Kinematic variable  $p_T^l$ ,  $E_T^\nu$ ,  $m_T^l$  distributions in  $W \rightarrow l\nu$  ( $l=e/\mu$ ) channels
  - Likelihood fits of  $M_W$ -parameterized simulation templates
  - Lepton E/p scale and recoil calibration with  $J(\psi)/Y/Z \rightarrow ll$  data

- Results:

	$M_W$ (MeV)
CDF Run II $2.2\text{fb}^{-1}$ ( $l=e/\mu$ )	$80387 \pm 12 \pm 15$
D0 Run II $5.3\text{fb}^{-1}$ ( $l=e$ )	$80375 \pm 11 \pm 20$

- Dominant systematic as lepton E/p scale and PDF
- Tevatron combined with BLUE

$$M_W = 80387 \pm 16 \text{ MeV}$$

Consistent with the latest ATLAS result of  $80370 \pm 19$  MeV

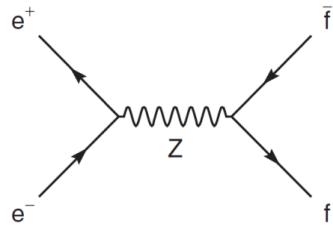

[arXiv:1701.07240](https://arxiv.org/abs/1701.07240)

- Status: analysis with full data set of both CDF and D0 are being finalized respectively

# The effective weak mixing angle

- Weak neutral current V-A couplings

$$- i \frac{g}{2 \cos \theta_W} \bar{f} \gamma^\mu (g_V^f - g_A^f \gamma_5) f Z_\mu$$

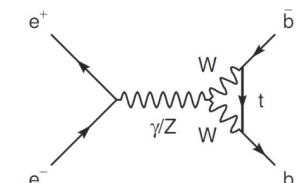

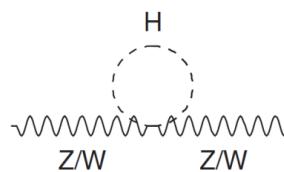

$$\left\{ \begin{array}{l} g_V^f = I_3^f - 2Q_f \sin^2 \theta_W \\ g_A^f = I_3^f \end{array} \right.$$

$$\sin^2 \theta_W = 1 - \frac{M_W^2}{M_Z^2}$$

("on-shell")

- High order corrections factorized as enhanced Born approximation(EBA)

$$\sin^2 \theta_{\text{eff}}^f = \text{Re}(\kappa_f) \sin^2 \theta_W = \frac{1}{4|Q_f|} \left( 1 - \frac{\text{Re}[g_V^f]}{\text{Re}[g_A^f]} \right)$$

- The effective mixing angle: converged to leptonic one

$$\sin^2 \theta_{\text{eff}}^{\text{Lept}} = \text{Re}[\kappa_l(M_Z)] \cdot \sin^2 \theta_W$$

("effective", Zfitter)

$$\left\{ \begin{array}{l} \sin^2 \theta_{\text{eff}}^u \approx \sin^2 \theta_{\text{eff}}^l - 0.0001, \\ \sin^2 \theta_{\text{eff}}^d \approx \sin^2 \theta_{\text{eff}}^l - 0.0002, \\ \sin^2 \theta_{\text{eff}}^b - \sin^2 \theta_{\text{eff}}^{\text{lept}} \approx 0.0014, \end{array} \right.$$

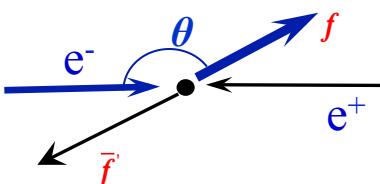

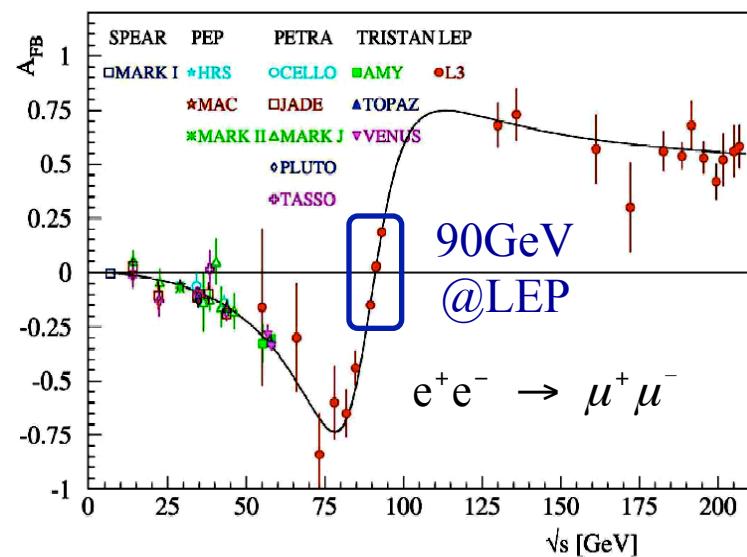

(modified Resbos)

Can be directly measured via Parity-violating observables at Z-pole

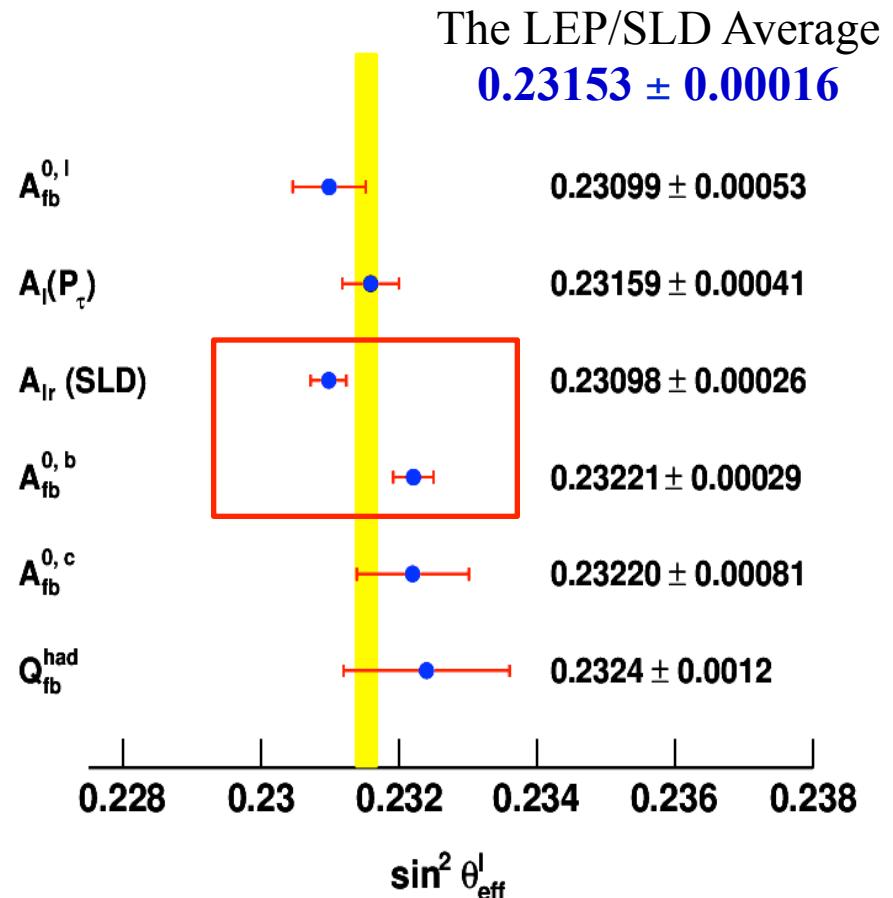

# The effective weak mixing angle

- The most precise results, LEP b-quark  $A_{fb}^{0,b}$  and SLD beam LR-polarization  $A_{lr}$ , differ **3.2 $\sigma$**

$$A_{FB} = \frac{\sigma_F - \sigma_B}{\sigma_F + \sigma_B}$$

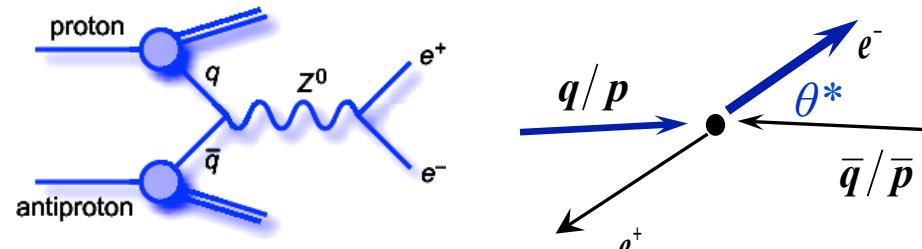

$$\sigma_{F/B} = \int_{0/-1}^{+1/0} \frac{d\sigma}{dcos\theta} dc cos\theta$$

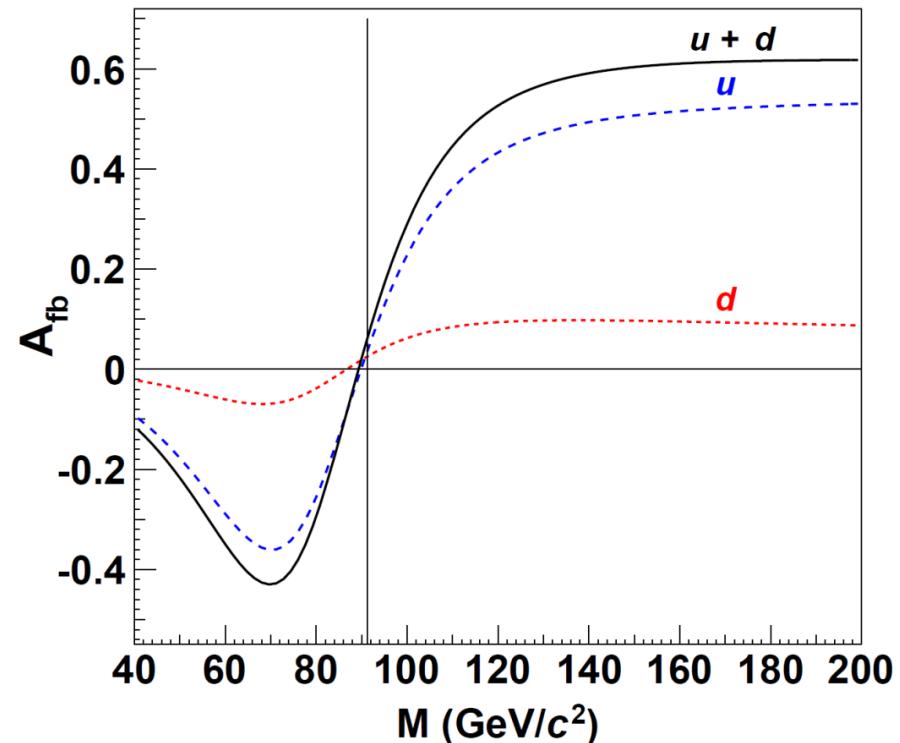

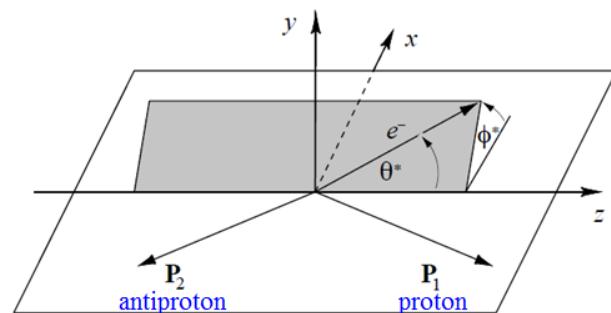

# The weak mixing angle @ Tevatron

- Measure background-subtracted  $A_{FB}$  as function of invariant mass in Collins-Soper frame

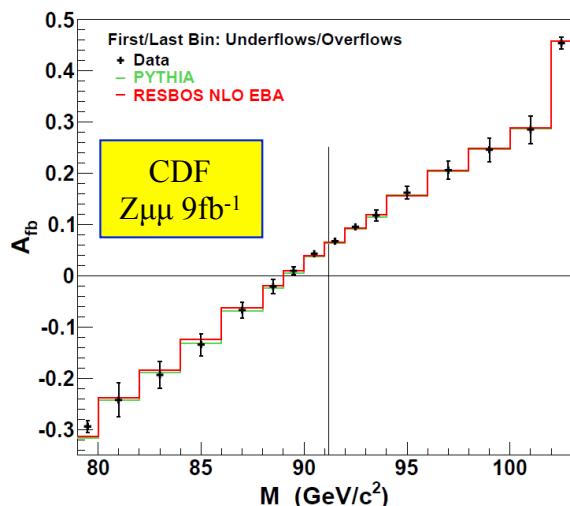

$$\cos \theta^* = \frac{2(p_l^+ p_{l\bar{l}}^- - p_l^- p_{l\bar{l}}^+)}{m(l\bar{l}) \sqrt{m^2(l\bar{l}) + p_T^2(l\bar{l})}}$$

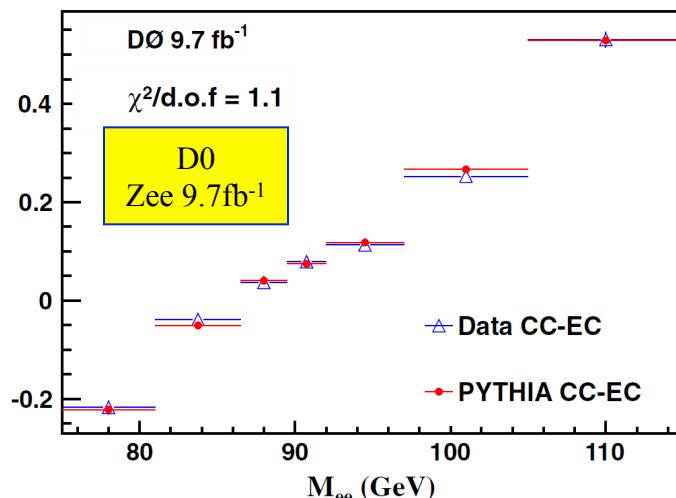

- Minimal- $\chi^2$  fits between data  $A_{FB}$  versus  $\sin^2 \theta_W$ -parameterized MC simulations

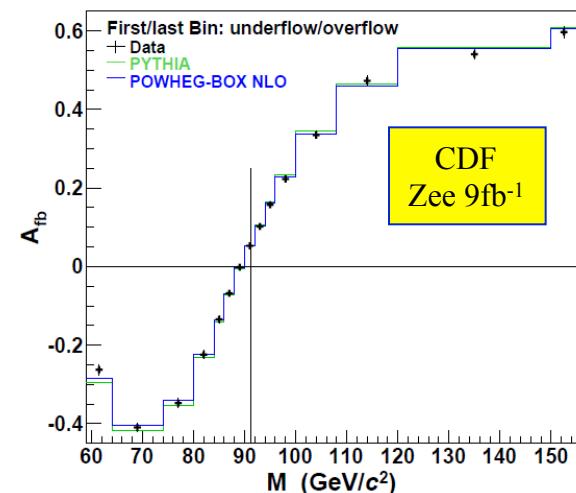

# The weak mixing angle @ CDF + D0

**PRD 89(2014)072005**

# The weak mixing angle @ Tevatron

- Preliminary combination of CDF Z $\mu\mu$ +Zee and D0 Zee results
- Transferred to ZFitter and NNPDF3.0 conventions

$$\sin^2 \theta_{\text{eff}}^{\text{lept}} = 0.23179 \pm 0.00030 \pm 0.00017$$

$$0.23179 \pm 0.00035$$

extra  $\sim 21\%$  sensitivity to the LEP/SLD Average

- $M_W$  determination:

$$80.385 \pm 0.015 \text{ (LEP+Tevatron Direct)}$$

$$80.351 \pm 0.018 \text{ (Tevatron Indirect)}$$

FERMILAB-CONF-16-295-E

# The weak mixing angle @ D0 Z $\mu\mu$ preliminary

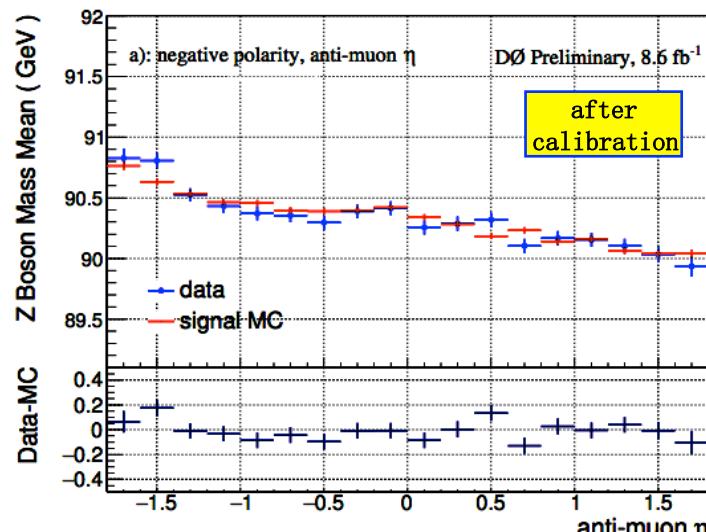

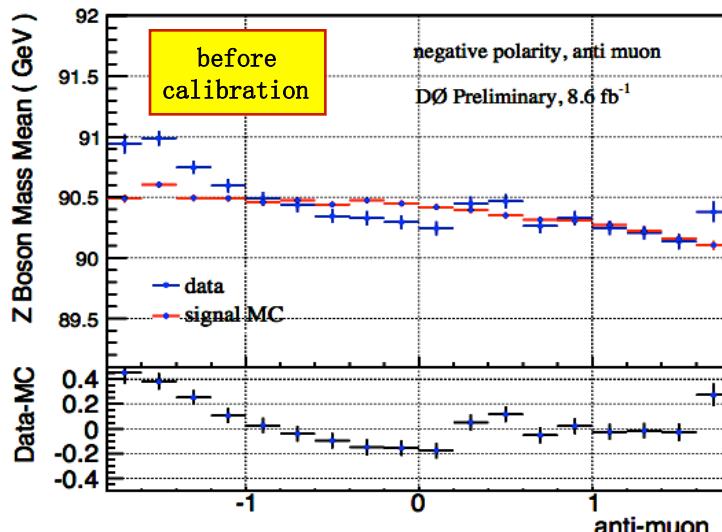

## ● Last channel @ Tevatron :

- 8.6 fb $^{-1}$  Z $\mu\mu$  events,  $p_T > 15 \text{ GeV}$ ,  $|\eta| < 1.8$ ; opposite charge,  $74 < M_{\mu\mu} < 110 \text{ GeV}$
- Modified Resbos + NNPDF3.0
- Compared to Zee result, lower sensitivity and charge  $q$ -dependence in  $\mu$   $p_T$  reconstruction

## ● Muon momentum calibration:

- Corrections for  $q$ - $\eta$ -solenoid dependence raised by residual mis-alignment
- Determined by observing dimuon mass mean

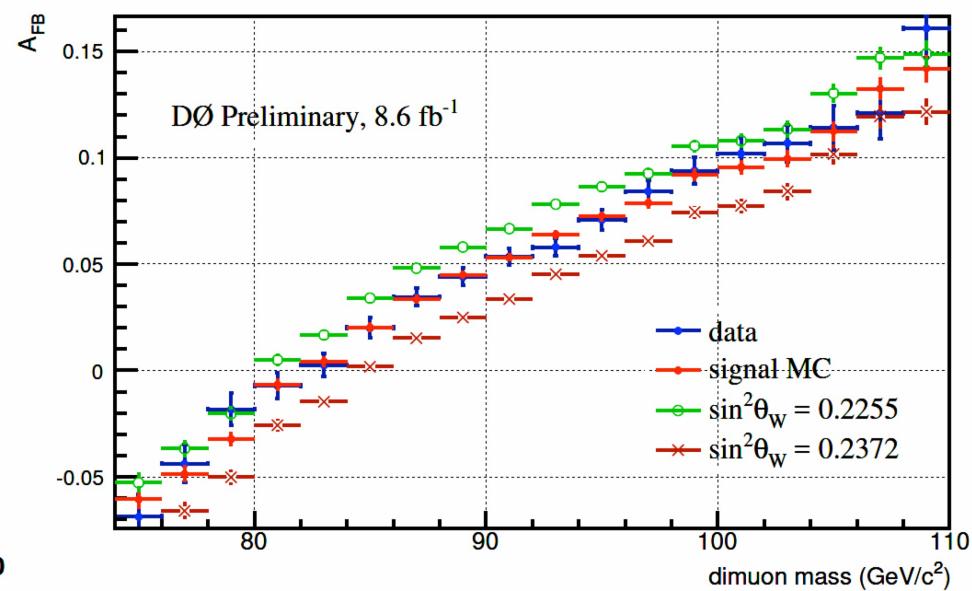

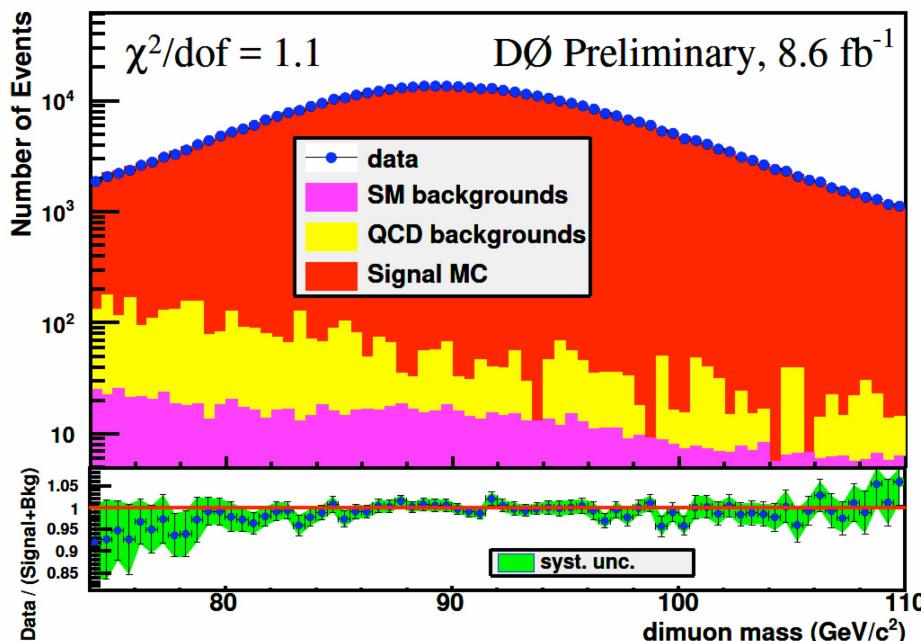

$$P(\eta, q, S) = \alpha(\eta, q, S) \times P_{\text{obs}}(\eta, q, S)$$

# The weak mixing angle @ D0 Z $\mu\mu$ preliminary

## ● Data-MC comparisons:

- 481,239 events selected in data; dijet background  $\sim 0.68\%$ , SM background  $\sim 0.20\%$
- Good agreements of muon  $p_T/\eta$ , and di-muon  $p_T/\eta/M/\cos\theta^*$  distributions are observed

- The effective  $\sin^2\theta_W$  is extracted from  $A_{FB}$  distributions in a mass region of  $74 < M_{\mu\mu} < 110 \text{ GeV}$

# The weak mixing angle @ D0 Z $\mu\mu$ preliminary

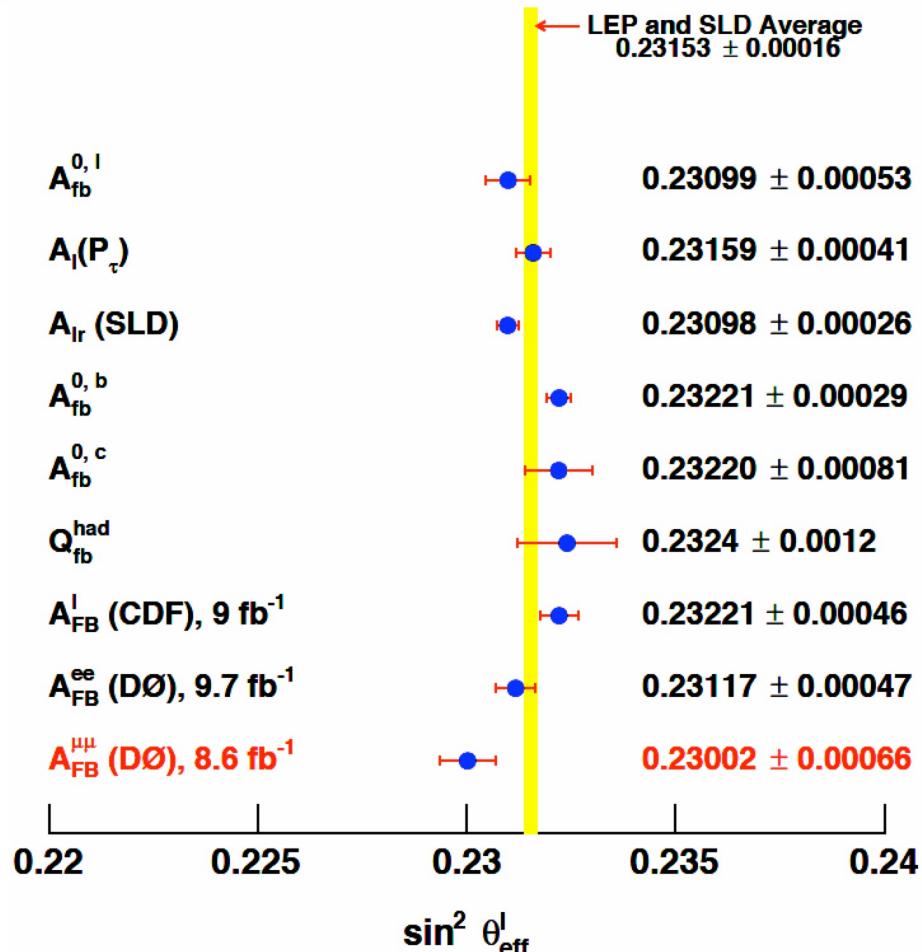

- Result:  $\sin^2 \theta_W^B = 0.22994 \pm 0.00059(\text{stat.}) \pm 0.00011(\text{syst.}) \pm 0.00027(\text{PDF})$

# Summary

## ● W mass:

- The current Tevatron combination,  **$80387 \pm 16$  MeV**, the most precise direct measurement
- Analysis of full CDF and D0 data are in progress

## ● Weak mixing angle:

- Preliminary Tevatron combination of  **$0.23179 \pm 0.00035$**  with CDF Z( $ee/\mu\mu$ ) and D0 Z( $ee$ ), and Tevatron indirect W mass result of  **$80351 \pm 18$  MeV**
- The preliminary result of  **$0.23002 \pm 0.00066$**  for D0 Z( $\mu\mu$ ) measurement
- The final Tevatron combination will be done, and expected to significantly contribute to the sensitivity of direct Z-pole measurements as the LEP/SLD/Tevatron Average

## ● Top mass:

- The full Tevatron combination,  **$173.30 \pm 0.65$  GeV**
- The latest D0 combination update,  **$174.95 \pm 0.75$  GeV**, submitted to PRD
