Readiness of the LHCb experiment for first data

lundi 9 mars 2009 16:55 (20 minutes)

The talk deals with the present status of the LHCb detector, with special emphasis on the commissioning tests and analysis. The detector response has been widely tested by means of cosmic ray events and with the very first beam before the LHC rupture in September 2008. The results of these studies are reported. Finally, ideas on the planned use of the first beam data, expected in 2009, are presented.
