MOCCa

```

- Skyrme Density Functionals
  - Up to N3LO in Skyrme.
  - SLy5s1 here (mostly)
  - Adjusted on radii and binding energies of a few spherical nuclei
- 3D coordinate representation
  - Accuracy independent of shape
  - Controllable accuracy
- Discrete symmetry breaking
  - Subgroups of  $D_{2h}^{TD}$
  - 16(!) different combinations
- Pairing: Full HFB
  - For every symmetry combination
  - Non-trivial for signature breaking

Less symmetries  $\Rightarrow$  more shapes

Prolate

Octupole

Non-axial octupole

Skyrme-HFB cranking Routhian.

$$R = E - \omega_x \hat{J}_x - \omega_y \hat{J}_y - \omega_z \hat{J}_z$$

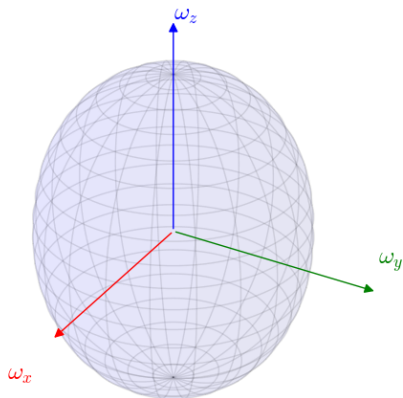

## Symmetries

$\hat{T}$  Time-reversal

$\hat{R}_y, \hat{R}_z$  y,z-signature

$\hat{R}_x, \hat{R}_z$  x,z-signature

$\hat{R}_x, \hat{R}_y$  x,y-signature

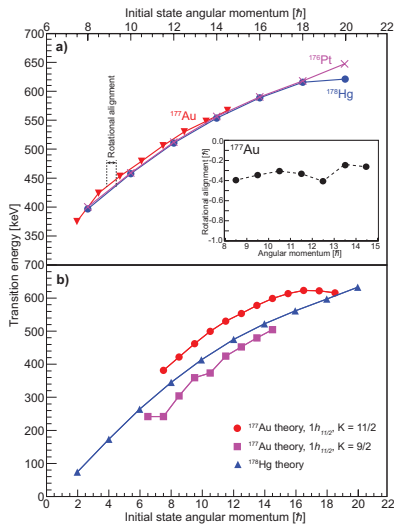

Strong-coupling scheme  
(for  $\approx$  axial nuclei)

$$J(J+1) = |\vec{J}_{\text{tot}}|^2 = J_{\text{coll}}^2 + K^2$$

M. Venhart, W.R., M.B. P.-H.H., *et al.*  
PRC 95, 061302 (2017)

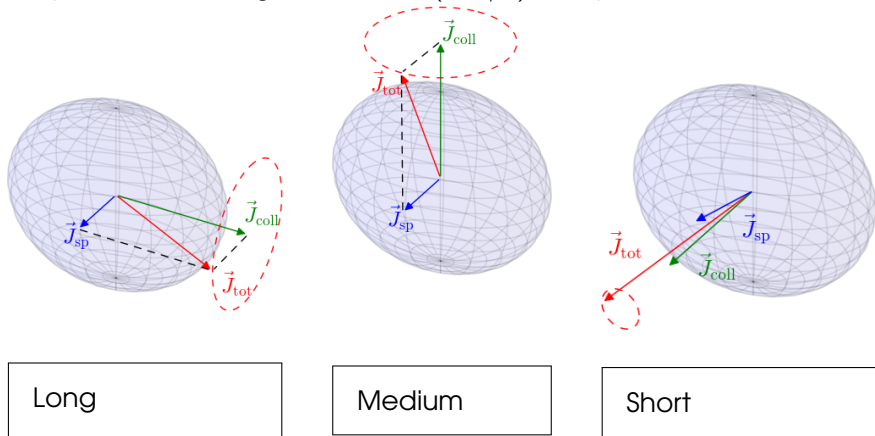

Complete alignment

W.R., P.-H.H. and M.B.,  
in preparation.

Principal **A**xis **C**ranking, based on  $\pi(h11/2)$  odd proton.

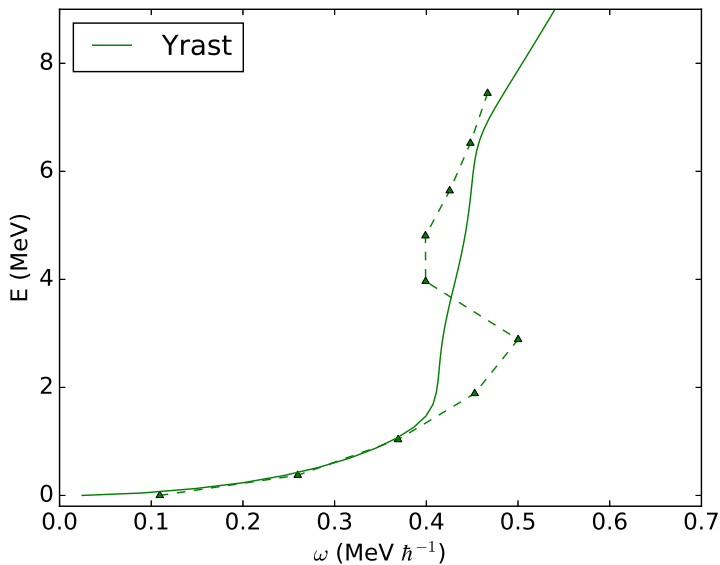

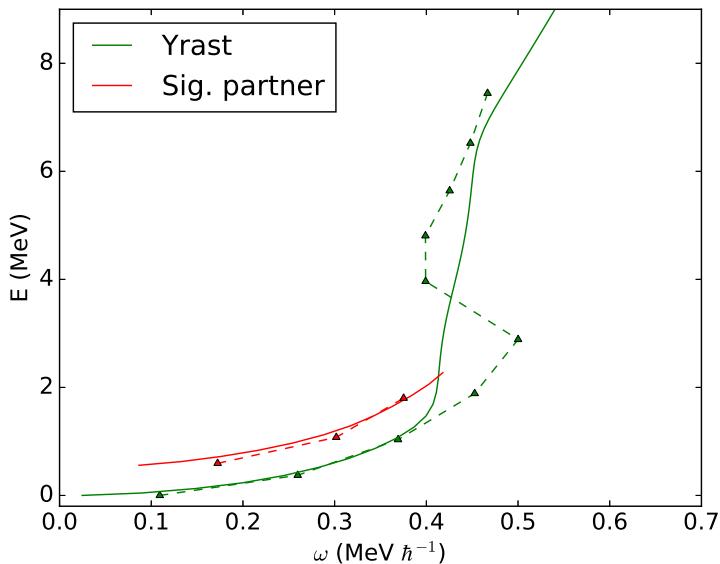

All experimental data from  
J.T. Matta *et al*, Phys. Rev. Lett. **114**, 082501 (2015).

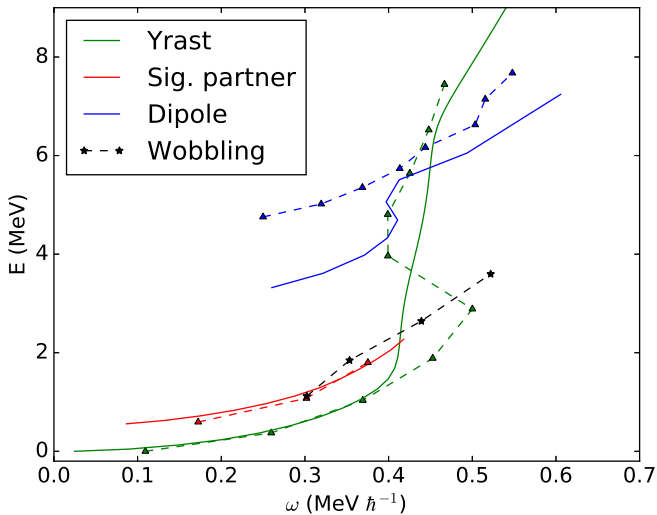

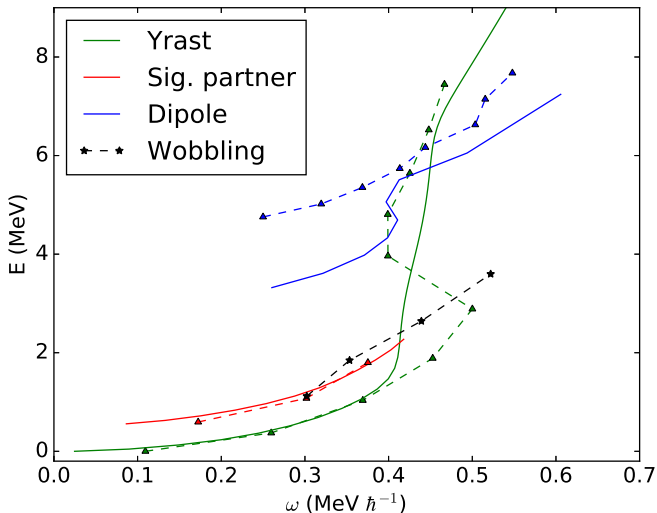

Symmetry restoration needed!

## MOCCa is operational

- Unrestricted by symmetries
- Full HFB pairing

## Rotational bands of odd nuclei

- Difficult to get J
- Can be modelled
- Alignment in  $^{177}\text{Au}$
- Octupole  $^{223}\text{Th}$

## Reproduction of $^{135}\text{Pr}$

- Correct band-head
- Yrast band
- Signature partner band
- Dipole band
- Possibility for wobbling

## Collaborators

- M. Bender, CNRS/IPNL
- P.-H. Heenen, ULB
- K. Bennaceur, IPNL
- D. Davesne, IPNL
- B. Bally, UAM
- J. Meyer, IPNL
- V. Hellemans
- B. Avez

## But also

- CC of the IN2P3, French computing resources.
- CECI, Belgian computing resources.
- You, for your attention.
