N* structure

Study of the Structure of Excited Nucleons by means of the calculation of the electromagnetic transition form factors of the nucleons

E. Santopinto
INFN
Department of Physics Genova University

"Nucleon and Resonance Structure with Hard Exclusive Processes"
29-31 mai 2017
IPN Orsay

Outline of the talk

- The Models & hCQM and Int qDiqM
- The helicity amplitudes
- The elastic e.m. form factors of the nucleon
- The Unquenched Quark Model (higher Fock components in a systematic way)

The Model
(hCQM)

hypercentral **C**onstituent **Q**uark **M**odel

different CQMs for bayons

Hypercentral Constituent Quark Model
hCQM

free parameters fixed from the spectrum

Comment
The description of the spectrum is the first task of a model builder

Predictions for:
photocouplings
transition form factors
elastic from factors
....

describe data (if possible)
understand what is missing

LQCD (De Rújula, Georgi, Glashow, 1975)

the quark interaction contains

a long range spin-independent confinement

a short range spin dependent term

Spin-independence $\longrightarrow$ SU(6) configurations

SU(6) configurations for three quark states

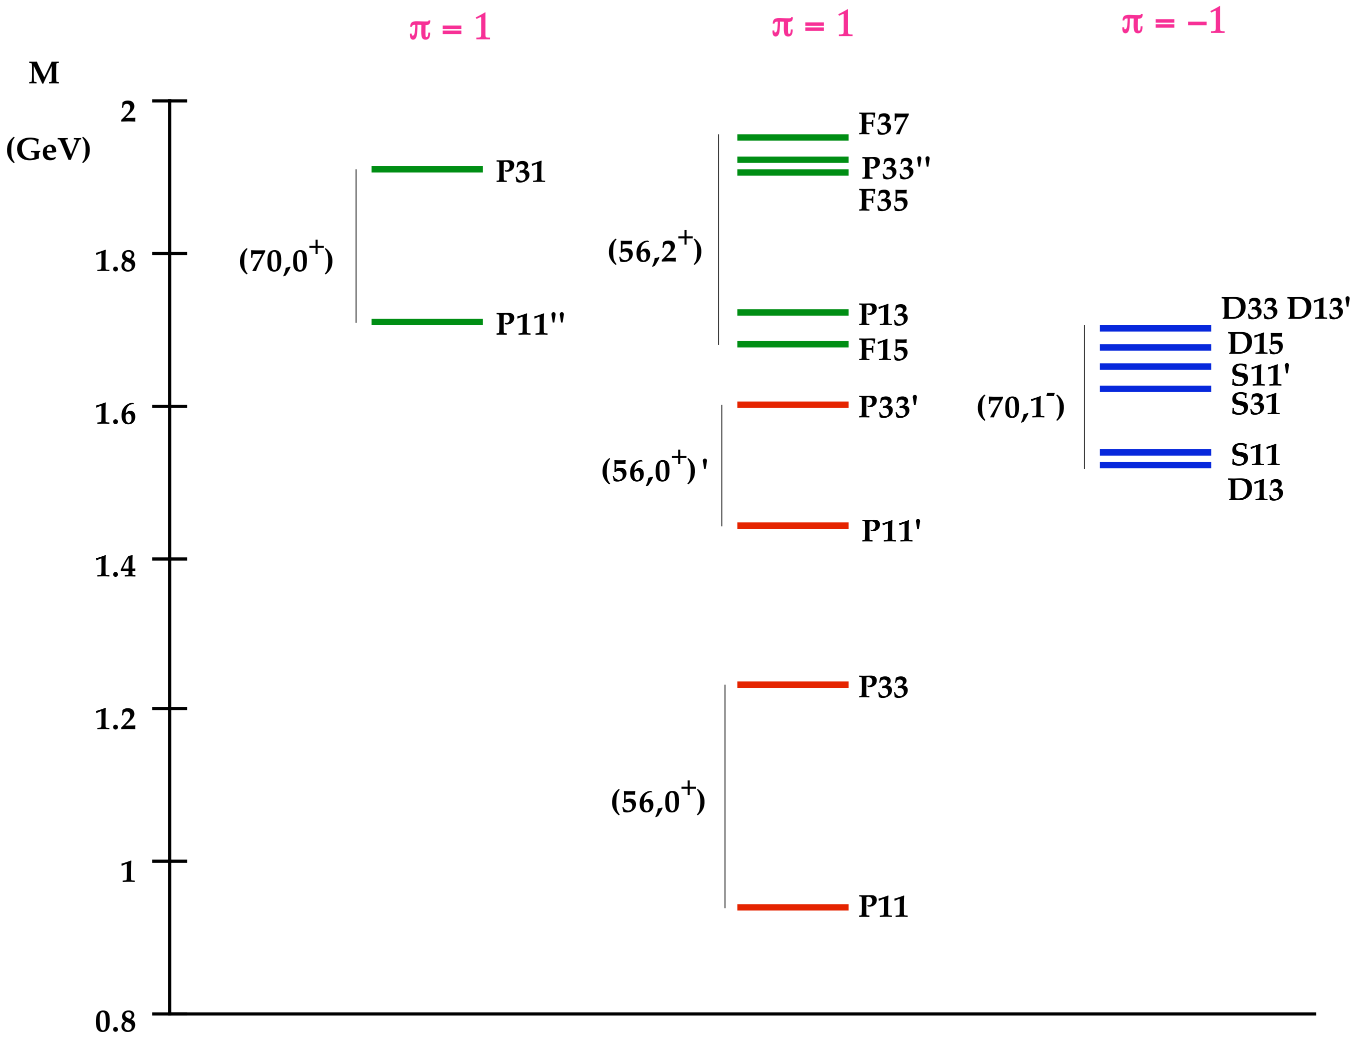
$$6 \times 6 \times 6 = \underset{A}{20} + \underset{M}{70} + \underset{M}{70} + \underset{S}{56}$$

Notation

(d, L^{π})

d = dim of SU(6) irrep
L = total orbital angular momentum
π = parity

PDG 4* & 3*



π = 1
π = 1
π = −1

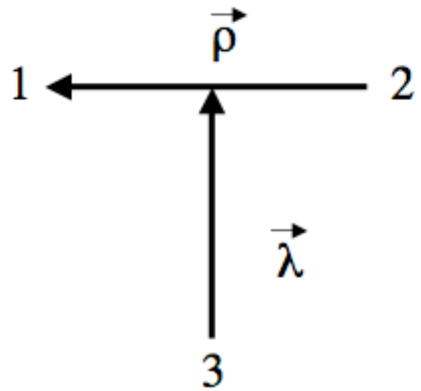
Jacobi coordinates



Hyperspherical Coordinates

$$(\rho, \Omega_\rho, \lambda, \Omega_\lambda) \Rightarrow (x, t, \Omega_\rho, \Omega_\lambda)$$

$$x = \sqrt{\rho^2 + \lambda^2}$$ hyperradius

$$t = arctg\frac{\rho}{\lambda}$$ hyperangle

$$\gamma = 2n + l_\rho + l_\lambda$$

$$L^2(\Omega) Y_{[\gamma]}(\Omega) = -\gamma(\gamma+4) Y_{[\gamma]}(\Omega)$$

$$L^2(\Omega) \Leftrightarrow C_2(O(6))$$

γ grand angular quantum number

$Y_{[\gamma]}(\Omega)$ Hyperspherical harmonics

$$\sum_{i<j} V(\mathbf{r}_{ij}) \approx V(x) + \ldots$$

$$\gamma = 2n + l_\rho + l_\lambda$$

Hasenfratz et al. 1980:
$\Sigma\, V(r_i, r_j)$ is approximately hypercentral

Hypercentral Hypothesis

$V = V(x)$

Factorization

$$\psi(x,t,\Omega_\rho,\Omega_\lambda) = \psi_{\nu\gamma}(x) \quad Y_{[\gamma,l_\rho,l_\lambda]}$$

("dynamics") ("geometry")

Only one differential equation in x (hyperradial equation)

Hypercentral Model

Phys. Lett. B, 1995

$V(x) = -\tau/x + \alpha\, x$

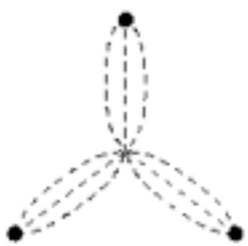
Hypercentral approximation of $V = -\, b/r + c\, r$

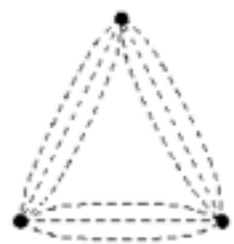
- QCD fundamental mechanism

3-body forces

Carlson et al, 1983
Capstick-Isgur 1986
hCQM 1995

- Flux tube model



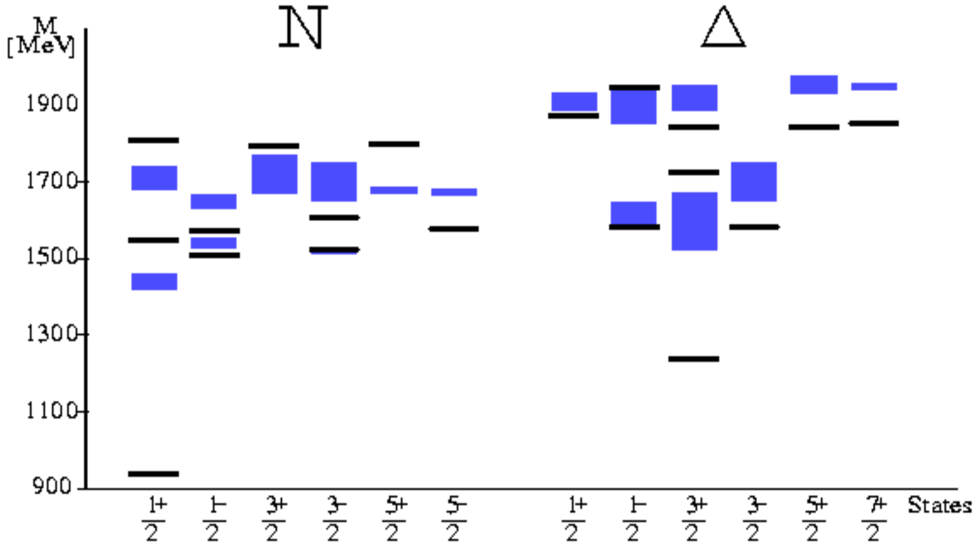


Hypercentral Model (1)

$$H_{3q} = 3m + \sum_{i=1}^{3} \frac{\mathbf{p}_i^2}{2m} + V(x) + H_{hyp}$$

M. Ferraris, M. M. Giannini, M. Pizzo, E. Santopinto, L. Tiator, Phys. Lett. B364 (1995), 231

- $V(x) = -\frac{\tau}{x} + \alpha x;$ $\quad H_{hyp} = A \left[\sum_{i<j} V^S(\mathbf{r}_i, \mathbf{r}_j) \;\; \boldsymbol{\sigma}_i \cdot \boldsymbol{\sigma}_j + \text{tensor} \right]$
- 3 parameters $\tau \;\alpha\; A \leftarrow$ fixed to the spectrum, $m = \frac{M}{3}$



$\tau = 4.59$

$\alpha = 1.61 \text{ fm}^{-1}$

$A \Leftarrow (N - \Delta)$

$x = \sqrt{\rho^2 + \lambda^2}$

hyperradius

Results (predictions) with the Hypercentral Constituent Quark Model

for

- ❑ Helicity amplitudes
- ❑ Elastic nucleon form factors

The helicity amplitudes

HELICITY AMPLITUDES

Extracted from electroproduction of mesons

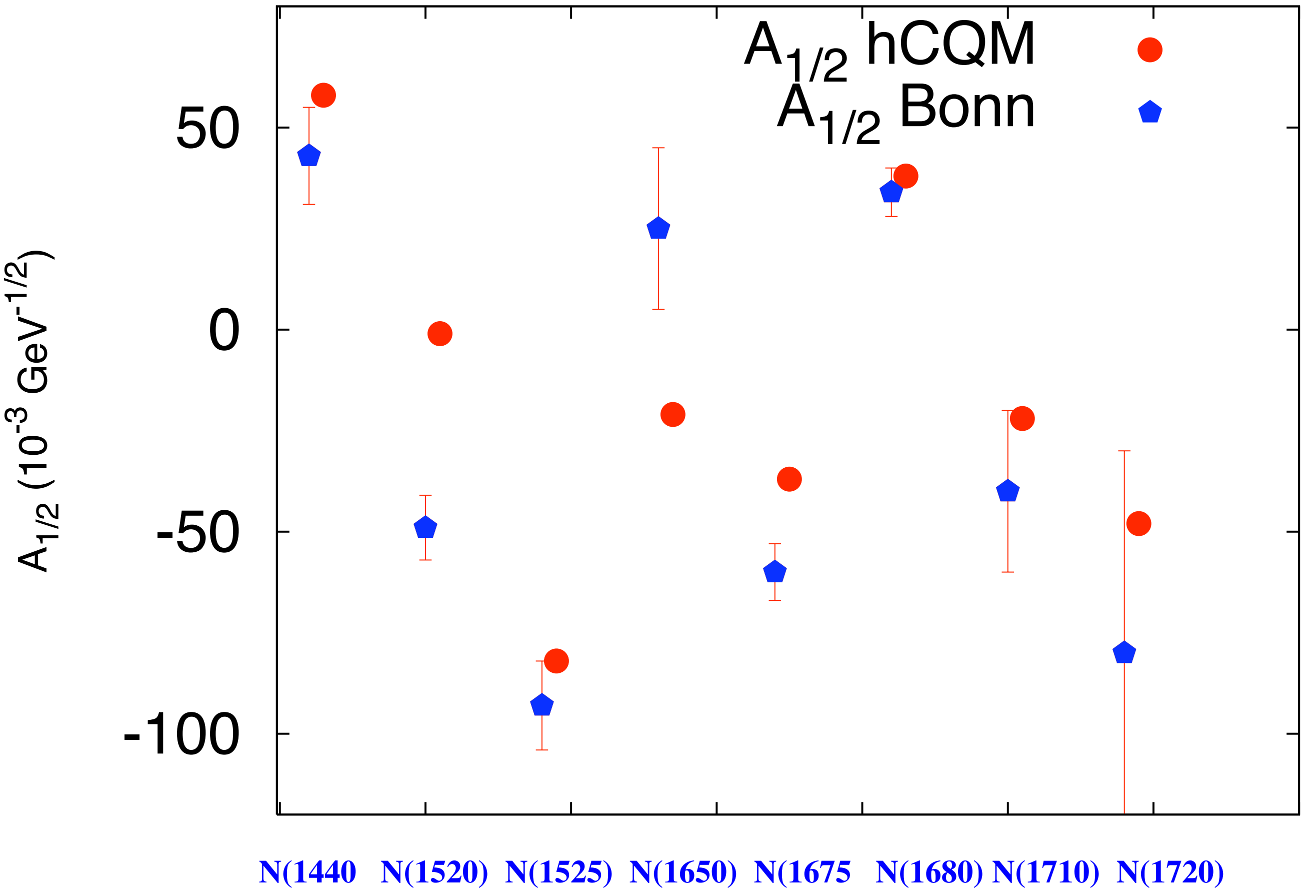
Neutron photocouplings



hCQM: E. Santopinto, M.G. Phys. Rev. C86, 065202 (2012)
Bonn: A.V. Anisovich et al., EPJ A49, 67 (2013)

- The hCQM seems to provide realistic three-quark wave functions
- The main reason is the presence of the **hypercoulomb** term

Solvable model

$V(x) = -\tau/x + \alpha x$ linear term treated as a perturbation

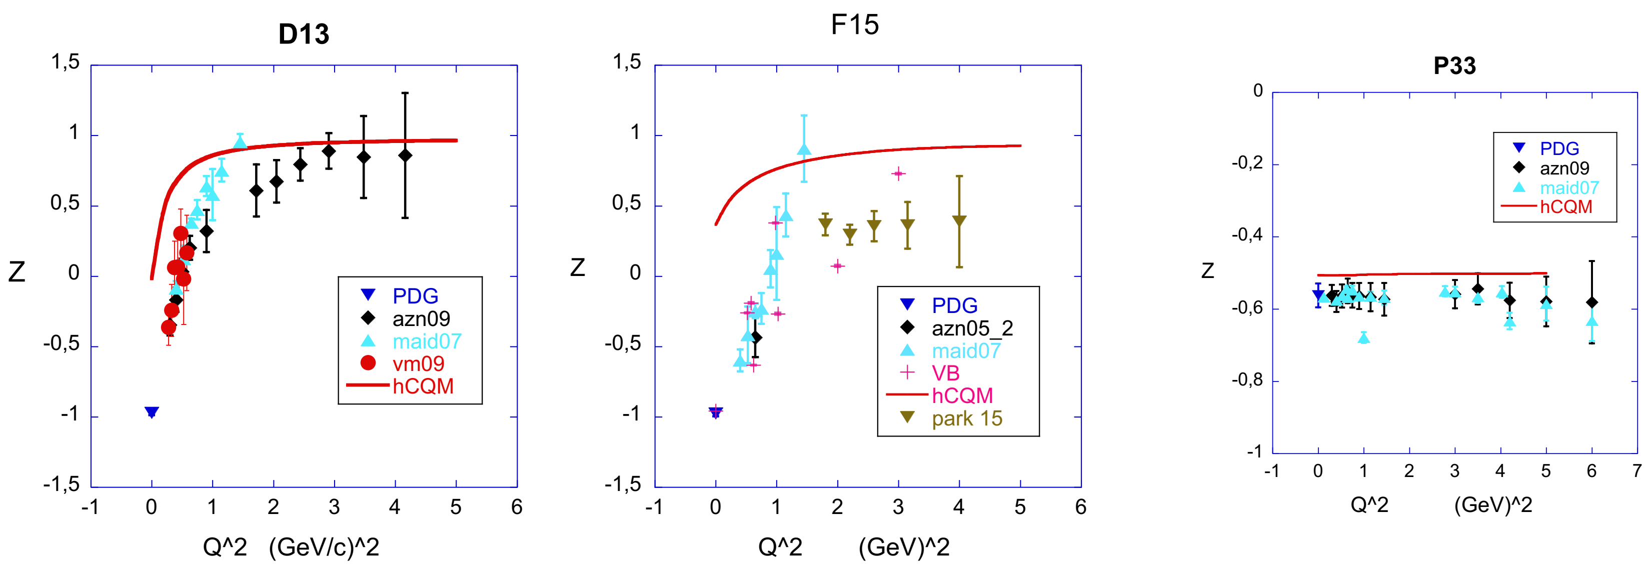
wf mainly concentrated in the low x region

- ➢ energy levels expressed analytically
- ➢ unperturbed wf given by the 1/x term
- ➢ major contribution to the helicity amplitudes

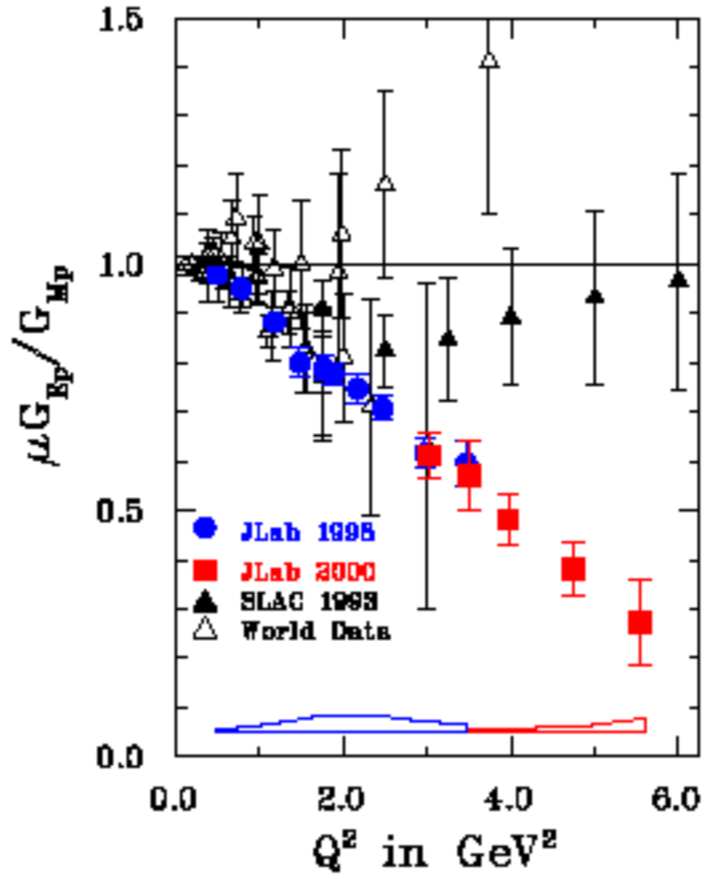
Good results due to semplicity

E. Santopinto, F. Iachello, M.Giannini, Eur. Phys. J. A **1**, 307 (1998)

$$Z = \frac{|A_{1/2}|^2 - |A_{3/2}|^2}{A_{1/2}|^2 + |A_{3/2}|^2}$$



The nucleon elastic form factors



- elastic scattering of polarized electrons on polarized protons

- measurement of polarizations asymmetry gives directly the ratio G^p_E/G^p_M

- discrepancy with Rosenbluth data (?)

- linear and strong decrease

- pointing towards a zero (!)

- latest data seem to confirm the behaviour

RELATIVITY

Various levels

- relativistic kinetic energy
- Lorentz boosts
- Relativistic dynamics
- quark-antiquark pair effects (meson cloud)
- relativistic equations (BS, DS)

Point Form Relativistic Dynamics

Point Form is one of the Relativistic Hamiltonian Dynamics
for a fixed number of particles (Dirac)

Construction of a representation of the Poincaré generators
P_μ (tetramomentum), J_k (angular momenta), K_i (boosts)
obeying the Poincaré group commutation relations
in particular

$$[P_k, K_i] = i\, \delta_{kj}\, H$$

Three forms:
Light (LF), Instant (IF), Point (PF)
Differ in the number and type of (interaction) free generators

Point form: P_μ interaction dependent

J_k and K_i free

Composition of angular momentum states as in the non relativistic case

Mass operator $M = M_0 + M_I$

$$M_0 = \Sigma_i \sqrt{\vec{\mathbf{p}}_i^{\,2} + m^2}$$

$$\Sigma_i \vec{\mathbf{p}}_i = 0$$

$\vec{\mathbf{P}}_i$ undergo the same Wigner rotation -> M_0 is invariant

Similar reasoning for the hyperradius

The eigenstates of the relativistic hCQM are interpreted as eigenstates of the mass operator M

Moving three-quark states are obtained through (interaction free) Lorentz boosts (velocity states)

Calculated values!

- Boosts to initial and final states
- Expansion of current to any order
- Conserved current

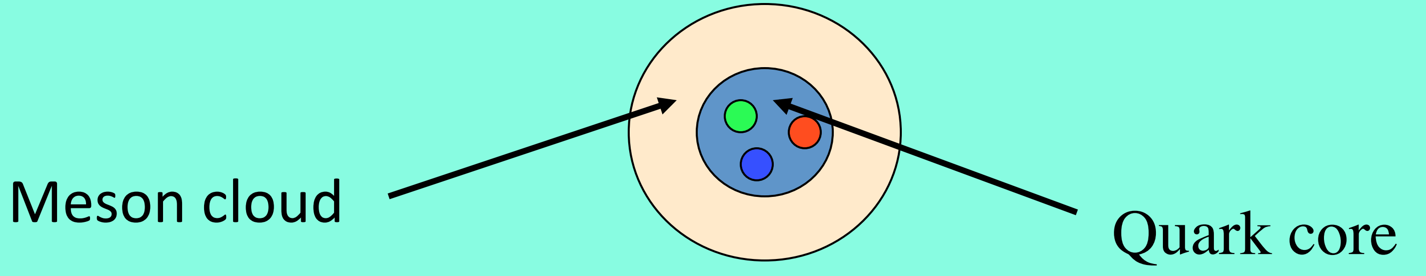
Few-Body Syst. **55 (2014) 873-876**

please note

- the medium Q^2 behaviour is fairly well reproduced
- there is lack of strength at low Q^2 (outer region) in the e.m. transitions

- emerging picture:

  quark core plus (meson or sea-quark) **cloud**



The Interacting Quark Diquark Model

Interacting qD model

E. Santopinto, PRC72, 022201 (2005)

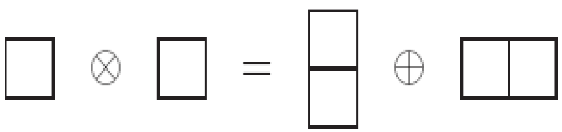
I part:Construction of the states

▪ Diquark

- **Two correlated quarks in S wave:symm.**

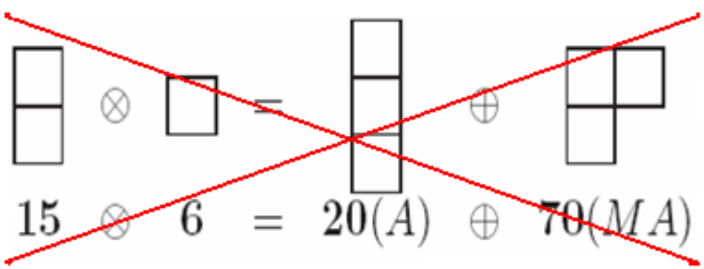
- **Baryon in 1_c color representazion → diquark in bar-3_c (A)**

- **Diquark WF:** **Ψ_D (spin-flavor) symmetric → 15 (A) repr. not present**

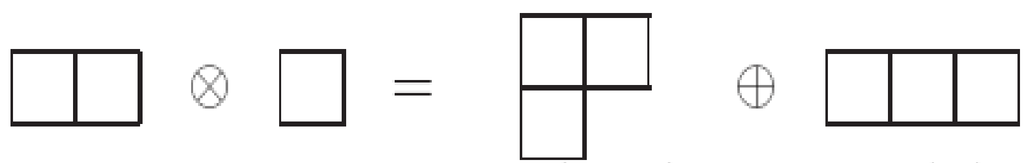


$$6 \otimes 6 = 15 \oplus 21$$

• $SU(6)_{sf}$ representations for baryons



$$15 \otimes 6 = 20(A) \oplus 70(MA)$$



$$21 \otimes 6 = 70(MS) \oplus 56(S)$$

- **Problem of missing resonances**

Scalar & axial-vector diquarks

- **21 $SU(6)_{sf}$ representation**
- **Decomposed in $SU(2)_s$ x $SU(3)_f$**
- **[bar-3,0] & [6,1] representations. Notation: [flavor,spin]**

- **“Good” & “bad” diquarks**
- **According to OGE-calculations, [bar-3,0] is energetically favored [Wilczek, Jaffe]**
- **[bar-3,0]: good (scalar) diquark**
- **[6,1]: bad (axial-vector) diquark**

Evidences of diquark correlations

- **Regge behavior of hadrons**

  Baryons arranged in rotational Regge trajectories ($J=\alpha+\alpha' M2$) with the same slope of the mesonic ones.

- **ΔI = ½ rule in weak nonleptonic decays**

  Neubert and Stech, Phys. Lett. B **231** (1989) 477; Phys. Rev. D **44** (1991) 775

- **Regularities in parton distribution functions and in spin-dependent structure functions**

  Close and Thomas, Phys. Lett. B **212** (1988) 227

- **Regularities in Λ(1116) and Λ(1520) fragmentation functions**

  Jaffe, Phys. Rept. **409** (2005) 1 [Nucl. Phys. Proc. Suppl. **142** (2005) 343]
  Wilczek, hep-ph/0409168

- **Any interaction that binds π and ρ mesons in the rainbow-ladder approximation of the DSE will produce diquarks**

  Cahill, Roberts and Praschifka, Phys. Rev. D **36** (1987) 2804

  Bender, Roberts and Von Smekal, Phys. Lett. B **380** (1996) 7

the Interacting qD model

E. Santopinto, PRC72, 022201 (2005)

- **Hamiltonian**

$$H = \frac{p^2}{2m} - \frac{\tau}{r} + \beta r + [B\delta_{S_{12},1} + C\delta_0] +$$
$$+ (-1)^{l+1} 2Ae^{-\alpha r}[(\vec{s}_{12}\cdot\vec{s}_3) + (\vec{t}_{12}\cdot\vec{t}_3) + (\vec{s}_{12}\cdot\vec{s}_3)(\vec{t}_{12}\cdot\vec{t}_3)]$$

- **Non-rel. Kinetic energy + Coulomb + linear confining terms**
- **Splitting between scalar & axial-vector diquarks**
- **Exchange potential**
-

TABLE III. The scalar form factors of Eq. (17) for transitions to final states labeled by the quantum numbers n, l^P, where P is the parity. The initial state is $n = 1, l^P = 0^+$ and $a = \frac{1}{2\tau m}$.

n	l^P	$\langle nl^P \vert U \vert 10^+ \rangle$
1	0^+	$\frac{1}{(1+k^2a^2)^2}$
2	1^-	$\frac{i}{\sqrt{2}} (\frac{4}{9})^3 \frac{24ka}{(1+\frac{16}{9}k^2a^2)^3}$
2	0^+	$16\sqrt{2}(\frac{4}{9})^3 \frac{(ka)^2}{(1+\frac{16}{9}k^2a^2)^3}$
3	2^+	$-\frac{4}{\sqrt{6}} (\frac{9}{16})^2 \frac{(ka)^2}{(1+\frac{9}{4}k^2a^2)^4}$
3	1^-	$\frac{i\sqrt{2}64ka}{27} (\frac{9}{16})^3 \frac{(1+\frac{27}{4}(ka)^2)}{(1+\frac{9}{4}k^2a^2)^4}$
3	0^+	$\frac{4}{\sqrt{3}} (\frac{9}{16})^2 \frac{(1+\frac{27}{4}(ka)^2)(ka)^2}{(1+\frac{9}{4}k^2a^2)^4}$

Rel. Interacting qD model – strange B.

E. S. and J. Ferretti, PRC92, 025202 (2015)

▪ Model

- **Model extended to strange sector**
- **Hamiltonian:**

$$
\begin{aligned}
M &= E_0 + \sqrt{\vec{q}^{\,2} + m_1^2} + \sqrt{\vec{q}^{\,2} + m_2^2} + M_{\rm dir}(r) \\
&+ M_{\rm ex}(r)
\end{aligned}
$$

$$
\begin{aligned}
M_{\rm ex}(r) &= (-1)^{L+1}\; e^{-\sigma r}\,[A_S\; \vec{s}_1 \cdot \vec{s}_2 \\
&+ A_F\; \vec{\lambda}_1^f \cdot \vec{\lambda}_2^f\; + A_I\; \vec{t}_1 \cdot \vec{t}_2]
\end{aligned}
$$

$$

Relativistic qD Model with Spin-Isospin (SI) transition interaction

M De Sanctis, J. Ferretti, E. S. Vassallo,**Eur.Phys.J. A52 (2016) no.5, 121**

- SI transition interaction mixes scalar and axial-vector diquark components

- Motivations:
  1. Improve reproduction of nonstrange baryon spectrum
  2. Introduce axial-vector diquark component in nucleon WF
- Better reproduction of nucleon e.m. form factors expected
- Other observables can also be computed

Model Hamiltonian

- $$H = E_0 + \sqrt{q^2 + m_1^2} + \sqrt{q^2 + m_2^2} + M_{dir} + M_{ex} + M_{cont} + M_{tr}$$
- $$M_{tr} = V_0 e^{-\frac{1}{2}\nu^2 r^2} (\vec{s}_2 \cdot \vec{S})(\vec{t}_2 \cdot \vec{T})$$
- S and T are spin and isospin transition operators

M De Sanctis, J. Ferretti, E. S., A. Vassallo,**Eur.Phys.J. A52 (2016) no.5, 121**

Giannini, Santopinto, Vassallo, *Eur. Phys. J .A12:447*

Many versions of CQMs have been developed

(IK, CI, GBE, U(7), hCQM,Bonn, etc.)

non relativistic and relativistic

While these models display peculiar features,

they share the following main features :

the effective degrees of freedom of 3q and a confining potential

the underling O(3) SU(3) symmetry

All of them are able to give a good description of the 3 and 4 stars spectrum

CQMs: S

Good description of the spectrum and magnetic moments

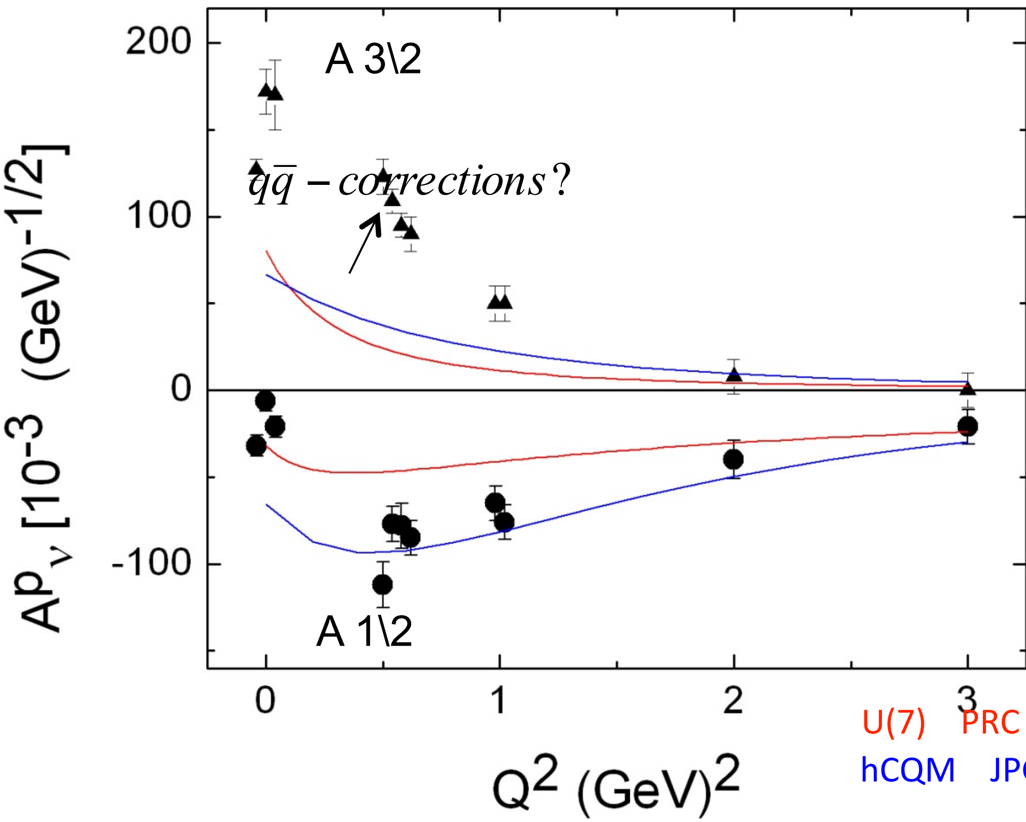
Predictions of many quantities:

- strong couplins
- photocouplings
- helicity amplitudes
- elastic form factors
- structure functions

Based on the effective degrees of freedom of 3 constituent quarks

Is it a degrees of freedom problem?

$q\bar{q}$ corrections ? important in the outer region



D13 transition amplitudes

U(7) PRC 54, 1935 (1996)

hCQM JPG 24, 753 (1998)

Considering also CQMs for mesons, CQMs able to reproduce the **overall trend of hundred of data**

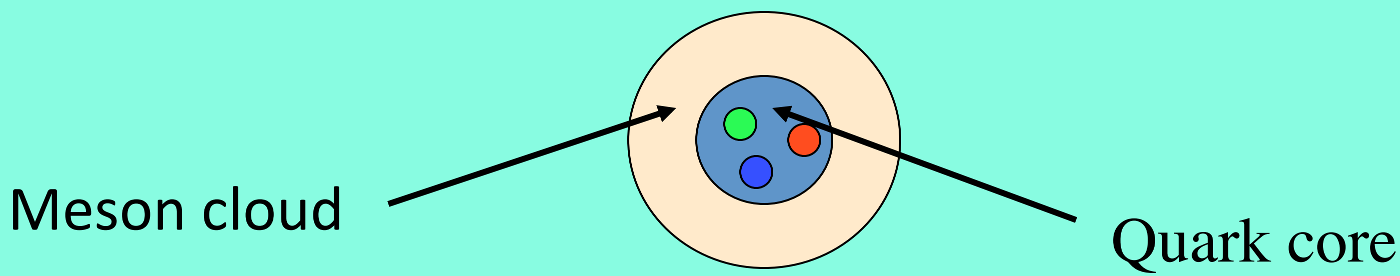
- … but they show very similar deviations for observables such as
- photocouplings
- helicity amplitudes,

please note

- the medium Q^2 behaviour is fairly well reproduced
- there is lack of strength at low Q^2 (outer region) in the e.m. transitions

- emerging picture:

  quark core plus (meson or sea-quark) **cloud**



There are two possibilities:

phenomenological parametrization

microscopic explicit quark description

Two main approaches

- the physical nucleon N is made of a bare nucleon dressed by a surrounding meson cloud

$$| \tilde{N} \rangle \quad = \quad \Psi^{N}_{(3q)} | \, N(qqq) \rangle + \sum_{B,M} \Psi^{(BM)}_{(3q)(q\bar{q})} | \, B(qqq) M(q\bar{q}) \rangle + \cdots$$

Problems of inconsistency

- Introducing higher Fock components

$$| \, \Psi \rangle \quad = \quad \Psi_{3q} | \, qqq \rangle + \Psi_{3q\, q\bar{q}} | \, 3q \, q\bar{q} \rangle$$

Consistency ok
But: how many components?

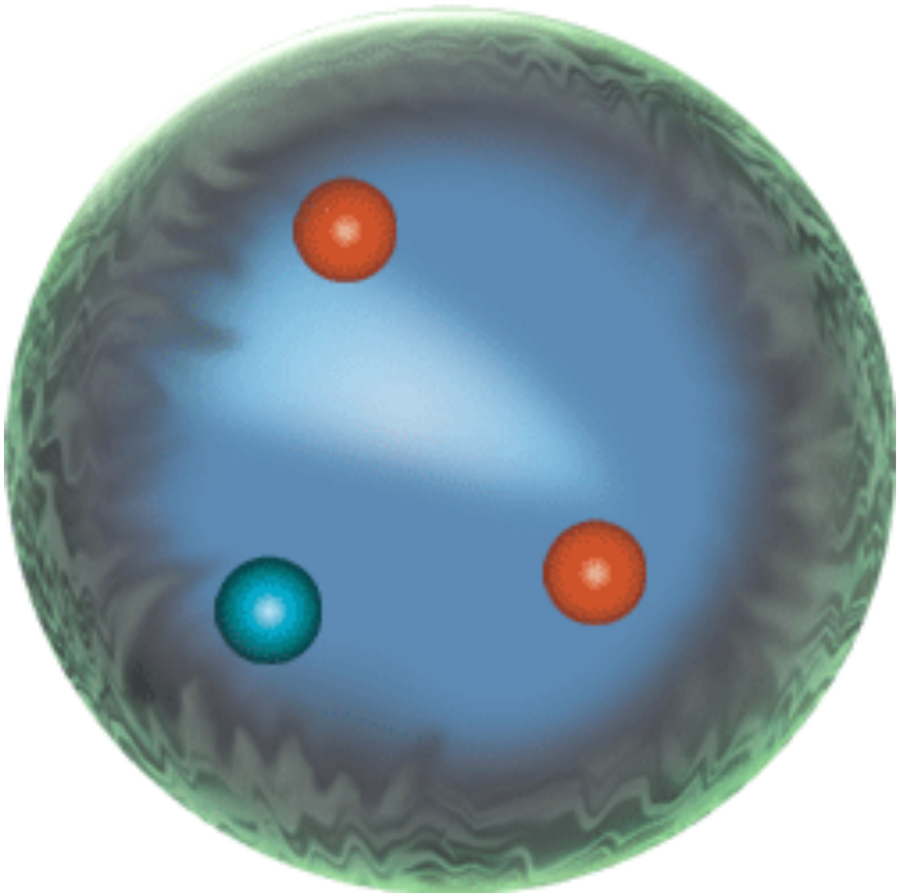
Necessity of unquenching the quark model

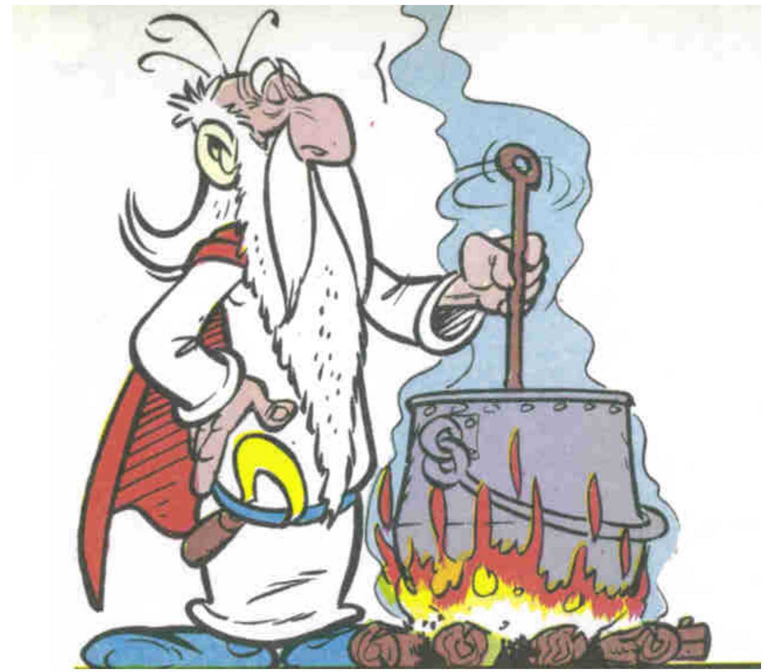
Exotic Degrees of Freedom

- Quark-antiquark pairs: pentaquarks, meson cloud models (Thomas, Speth, Kaiser, Weise, Oset, Brodsky, Ma, Isgur, …)
- Higher-Fock components (Riska, Zou, …)

$$\psi = \psi(q^3) + \alpha\,\psi(q^3 - q\bar{q})$$

Extend the CQM to include
the effects of quark-antiquark pairs
in a general and consistent way





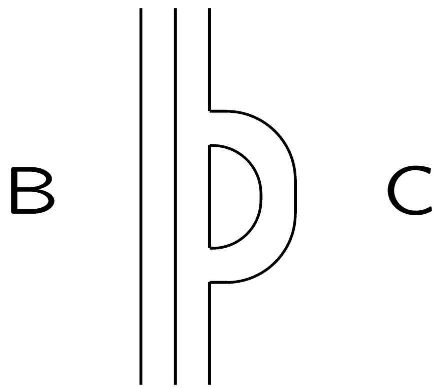
Problems

1) find a quark pair creation mechanism QCD inspired

2) implementation of this mechanism at the quark level but in such a way to

do not destroy the good CQMs results

Unquenched Quark Model



Strange quark-antiquark pairs in the proton with h.o. wave functions

Tornqvist & Zenczykowski (1984)
Geiger & Isgur, PRD 55, 299 (1997)
Isgur, NPA 623, 37 (1997)

- Pair-creation operator with $^3P_0$ quantum numbers of vacuum
- Important: sum over a large tower of intermediate states to preserve the phenomenological success of CQM

Geiger & Isgur, PRD 55, 299 (1997)

It would be desirable to devise tests of the mechanisms underlying the delicate cancellations which conspire to hide the effects of the sea in the picture presented here. It also seems very worthwhile to extend this calculation to $u\bar{u}$ and $d\bar{d}$ loops. Such an extension could reveal the origin of the observed violations [38] of the Gottfried sum rule [39] and also complete our understanding of the origin of the spin crisis. From our previous calculations [4], the effects of ‘‘un-

Extensions

Bijker & Santopinto,
PRC 80, 065210 (2009)

- Any initial baryon or baryon resonance
- Any flavor of the quark-antiquark pair
- Any model of baryons and mesons

Formalism

$$| \psi_A \rangle = \mathcal{N} \left\{ | A \rangle + \sum_{BClJ} \int d\vec{K}\, k^2 dk \; | BC\vec{K}k\, lJ \rangle \frac{\langle BC\vec{K}k\, lJ \mid T^\dagger \mid A \rangle}{M_A - E_B - E_C} \right\}$$

Three-quark configuration
SU(3) flavor symmetry

Five-quark component
Isospin symmetry

Pair-creation operator: $T^\dagger = T^\dagger({}^3P_0)$

L=S=1, J=0, color singlet, flavor singlet

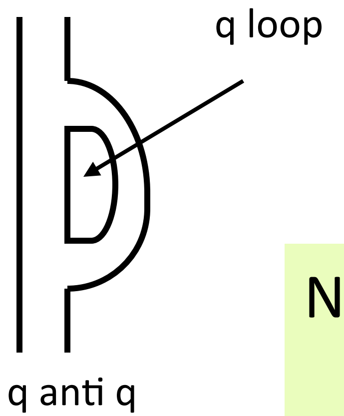
Unquenched Quark Model

- Harmonic oscillator quark model
- Sum over intermediate meson-baryon states includes for each oscillator shell all possible spin-flavor states
- Oscillator size parameters taken for baryons and mesons taken from literature (Capstick, Isgur, Karl)
- Smearing of the pair-creation vertex (Geiger, Isgur)
- Strength of $^3P_0$ coupling taken from literature on strong decays of baryons (Capstick, Roberts)

- No attempt to optimize the parameters

Unquenching the quark model

Mesons P. Geiger, N. Isgur, Phys. Rev. D41, 1595 (1990)
D44, 799 (1991)

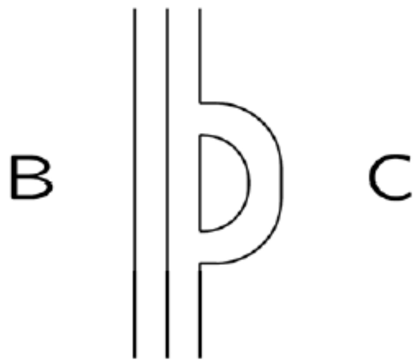


Pair-creation operator with 3P0 quantum number

Note:

- sum over complete set of intermediate states necessary for preserving the OZI rule
- linear interaction is preserved after renormalization of the string constant

Unquenched Quark Model



Strange quark-antiquark pairs in the proton with h.o. wave functions

Tornqvist & Zenczykowski (1984)
Geiger & Isgur, PRD 55, 299 (1997)
Isgur, NPA 623, 37 (1997)

- Pair-creation operator with $^3P_0$ quantum numbers of vacuum

The good magnetic moment results of the CQM are preserved by the UCQM

Bijker, Santopinto,Phys.Rev.C80:065210,2009.

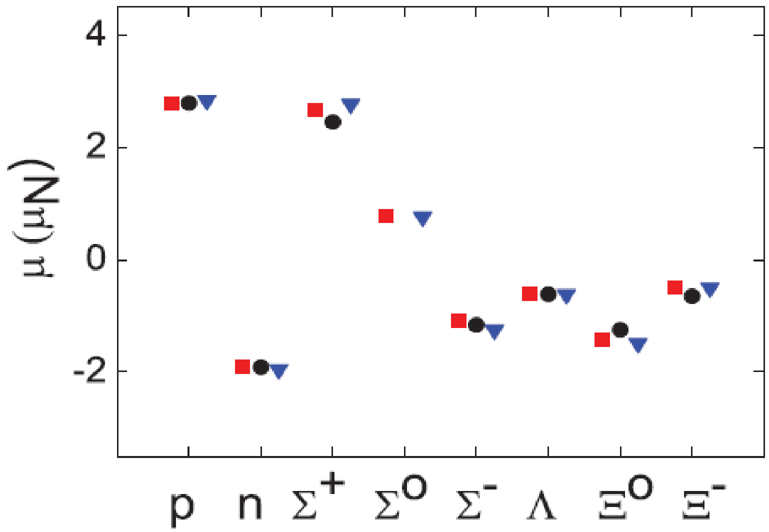


FIG. 3. (Color online) Magnetic moments of octet baryons: experimental values from the Particle Data Group [34] (circles), CQM (squares), and unquenched quark model (triangles).

Flavor Asymmetry

Gottfried sum rule

$$S_G = \int_0^1 dx \frac{F_{2p}(x) - F_{2n}(x)}{x} = \frac{1}{3} - \frac{2}{3}\int_0^1 dx \left[\bar{d}(x) - \bar{u}(x)\right]$$

$$S_G \neq \frac{1}{3} \Rightarrow N_{\bar{d}} \neq N_{\bar{u}}$$

$$S_G = 0.2281 \pm 0.0065$$

$$\int_0^1 dx \left[\bar{d}(x) - \bar{u}(x)\right] = 0.16 \pm 0.01$$

Proton Flavor asymmetry

Meson cloud models

Flavor asymmetries of octect baryons

Santopinto, Bijker, PRC 82,062202(R) (2010)

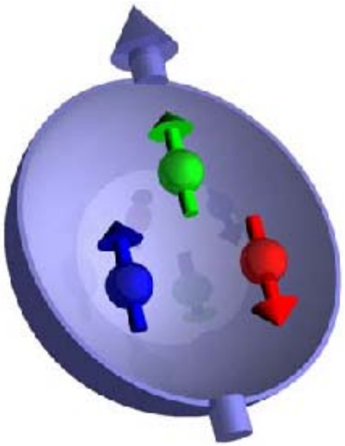
TABLE III. Relative flavor asymmetries of octet baryons.

Model	$\mathcal{A}(\Sigma^+)/\mathcal{A}(p)$	$\mathcal{A}(\Xi^0)/\mathcal{A}(p)$	Ref.
Unquenched CQM	0.833	−0.005	present
Chiral QM	2	1	Eichen
Balance model	3.083	2.075	Y.-J Zhang
Octet couplings	0.353	−0.647	Alberg

$$\Sigma^{\pm} p \rightarrow \ell^+ \ell^- + X \text{ (e.g., at CERN).}$$

3. Proton Spin Crisis

1980's



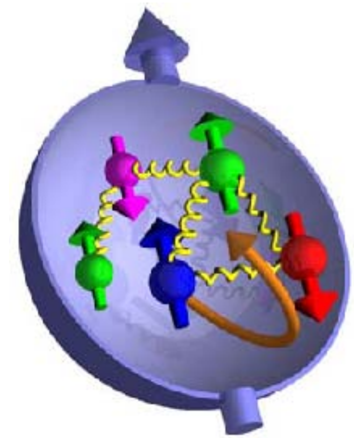
Naive parton model
3 valence quarks

$$\frac{1}{2} = \frac{1}{2}(\Delta u + \Delta d)$$

1990's

QCD: contributions from sea quarks and gluons

2000's



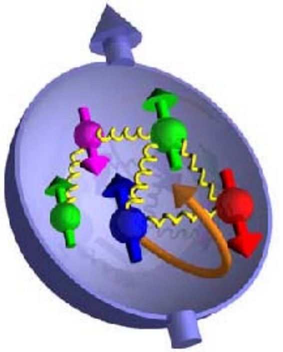
.. and orbital angular momentum

$$\frac{1}{2} = \frac{1}{2}\underbrace{(\Delta u + \Delta d + \Delta s)}_{\Delta\Sigma} + \Delta G + \Delta L$$

$$\left.\begin{aligned} \Delta u &= 0.842 \\ \Delta d &= -0.427 \\ \Delta s &= -0.085 \end{aligned}\right\} \Delta\Sigma = 0.330 \pm 0.039$$

HERMES, PRD 75, 012007 (2007)
COMPASS, PLB 647, 8 (2007)

Proton Spin



- COMPASS@CERN: Gluon contribution is small (sign undetermined)
- Unquenched quark model

Ageev et al., PLB 633, 25 (2006)
Platchkov, NPA 790, 58 (2007)

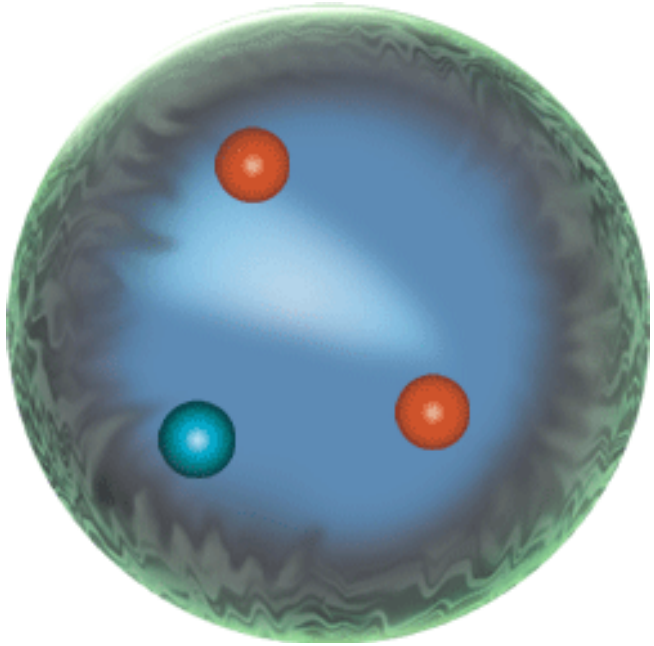
		CQM	Unquenched QM		
			Valence	Sea	Total
p	$\Delta\Sigma$	1	0.378	0.298	0.676
	$2\Delta L$	0	0.000	0.324	0.324
	$2\Delta J$	1	0.378	0.622	1.000

- More than half of the proton spin from the sea!
- Orbital angular momentum

Suggested by Myhrer & Thomas, 2008, but not explicitly calculated

4. Strangeness in the Proton

- The strange (anti)quarks come uniquely from the sea: there is no contamination from up or down valence quarks
- The strangeness distribution is a very sensitive probe of the nucleon's properties
- Flavor content of form factors
- New data from Parity Violating Electron Scattering experiments: SAMPLE, HAPPEX, PVA4 and G0 Collaborations



"There is no excellent beauty that hath not some strangeness in the proportion"
(Francis Bacon, 1561-1626)

Quark Form Factors

- Charge symmetry

$$G^{u,p} = G^{d,n} \equiv G^{u}$$
$$G^{d,p} = G^{u,n} \equiv G^{d}$$
$$G^{s,p} = G^{s,n} \equiv G^{s}$$

- Quark form factors

$$G^{u} = \left(3 - 4\sin^2\Theta_W\right) G^{\gamma,p} - G^{Z,p}$$
$$G^{d} = \left(2 - 4\sin^2\Theta_W\right) G^{\gamma,p} + G^{\gamma,n} - G^{Z,p}$$
$$G^{s} = \left(1 - 4\sin^2\Theta_W\right) G^{\gamma,p} - G^{\gamma,n} - G^{Z,p}$$

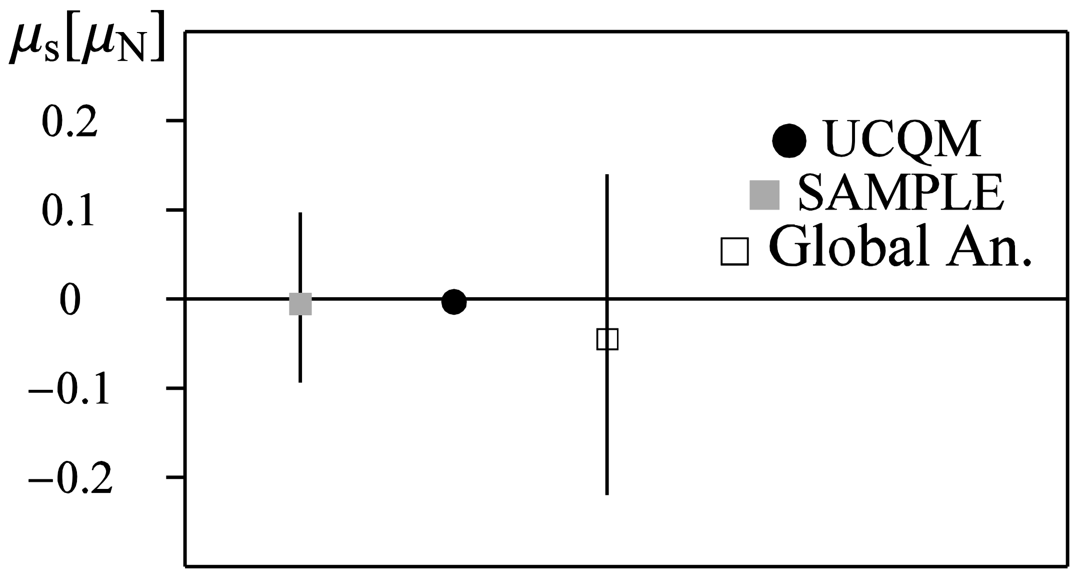
Kaplan & Manohar, NPB 310, 527 (1988)
Musolf et al, Phys. Rep. 239, 1 (1994)

Static Properties

$G_E(0) = e$	Electric charge
$G_M(0) = \mu$	Magnetic moment
$\left\langle r^2 \right\rangle_E = -6 \left. \frac{dG_E}{dQ^2} \right\|_{Q^2=0}$	Charge radius
$\left\langle r^2 \right\rangle_M = -\frac{6}{\mu} \left. \frac{dG_M}{dQ^2} \right\|_{Q^2=0}$	Magnetic radius

Strange Magnetic Moment

$$\vec{\mu}_s = \sum_i \mu_{i,s} \left[2\vec{s}(q_i) + \vec{\ell}(q_i) - 2\vec{s}(\bar{q}_i) - \vec{\ell}(\bar{q}_i) \right]$$

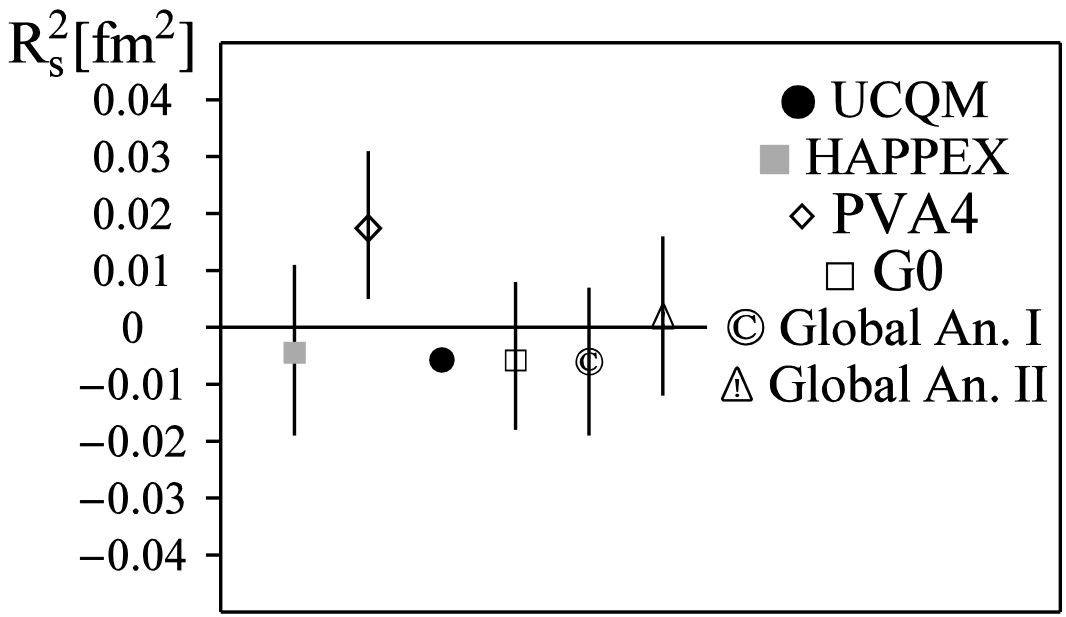


Jacopo Ferretti, Ph.D. Thesis, 2011

Bijker, Ferretti, Santopinto, Phys. Rev. C **85, 035204 (2012)**

Strange Radius

$$R_s^2 = \sum_{i=1}^{5} e_{i,s} \left(\vec{r}_i - \vec{R}_{CM}\right)^2$$



Jacopo Ferretti, Ph.D. Thesis, 2011

Bijker, Ferretti, Santopinto, Phys. Rev. C **85, 035204 (2012)**

Strange Proton

Unquenching the quark model for the MESONS & Why Unquenching?

Santopinto, Galatà, Ferretti, Vassallo

.

UQM: Meson Self Energies & couple channels

- Hamiltonian:

$$H = H_0 + V$$

- H_0 act only in the bare meson space and it is chosen the Godfray and Isgur model
- V couples |A> to the continuum |BC>
- Dispersive equation

$$\Sigma(E_a) = \sum_{BC} \int_0^{\infty} q^2 dq \, \frac{|V_{a,bc}(q)|^2}{E_a - E_{bc}}$$

- from non-relativistic Schrödinger equation
- Bare energy E_a (H_0 eigenvalue) satisfies:

$$M_a = E_a + \Sigma(E_a)$$

- M_a = physical mass of meson A
- $\Sigma(E_a)$ = self energy of meson A

UQM: Meson Self Energies -- UQM I

- Coupling $V_{a,bc}(q)$ in $\Sigma(E_a)$ calculated as:

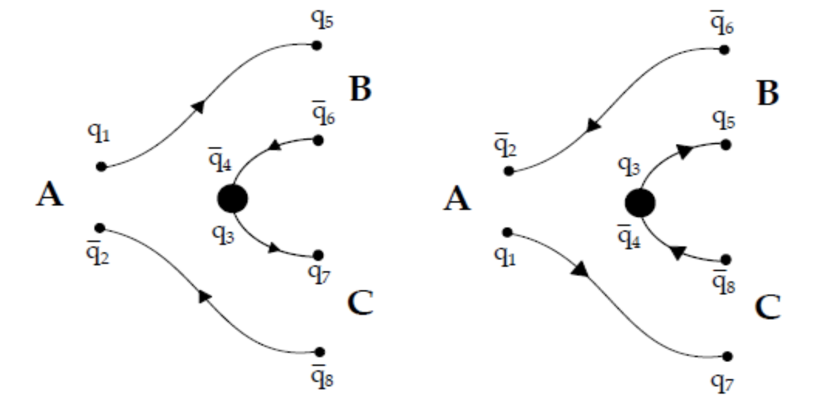
$$V_{a,bc}(q) = \sum_{\ell J} \langle BC\vec{q}\ell J | T^{\dagger} | A \rangle$$

Sum over a complete set of accesibl $SU_f(5) \otimes SU_{spin}(2)$

ground state (1S) mesons

Coupling calculated in the $^3P_0$ model

- Two possible diagrams contribute:



- Self energy in the UQM:

$$\Sigma(E_a) = \sum_{BC\ell J} \int_0^{\infty} q^2 dq \frac{\left| \langle BC\vec{q}\ell J | T^{\dagger} | A \rangle \right|^2}{E_a - E_b - E_c}$$

Godrey and Isgur model as bare mass

- Bare energies E_a calculated in the relativized G.I.Model for mesons
- Hamiltonian:

$$H = \sqrt{q^2 + m_1^2} + \sqrt{q^2 + m_2^2} + V_{\rm conf} + V_{\rm hyp} + V_{\rm so}$$

- Confining potential:

$$V_{\rm conf} = -\left(\frac{3}{4}c + \frac{3}{4}br - \frac{\alpha_s(r)}{r}\right)\vec{F}_1\cdot\vec{F}_2$$

- Hyperfine interaction:

$$V_{\rm hyp} = -\frac{\alpha_s(r)}{m_1 m_2}\left[\frac{8\pi}{3}\vec{S}_1\cdot\vec{S}_2\,\delta^3(\vec{r}) + \frac{1}{r^3}\left(\frac{3\,\vec{S}_1\cdot\vec{r}\,\vec{S}_2\cdot\vec{r}}{r^2} - \vec{S}_1\cdot\vec{S}_2\right)\right]\vec{F}_i\cdot\vec{F}_j$$

- Spin-orb. :

$$V_{\rm so,cm} = -\frac{\alpha_s(r)}{r^3}\left(\frac{1}{m_i}+\frac{1}{m_j}\right)\left(\frac{\vec{S}_i}{m_i}+\frac{\vec{S}_j}{m_j}\right)\cdot\vec{L}\;\vec{F}_i\cdot\vec{F}_j$$

$$V_{\rm so,tp} = -\frac{1}{2r}\frac{\partial H_{ij}^{conf}}{\partial r}\left(\frac{\vec{S}_i}{m_i^2}+\frac{\vec{S}_j}{m_j^2}\right)\cdot\vec{L}$$

UQM or couple channel Quark Model

- Parameters of the relativized QM fitted to

$$M_a = E_a + \Sigma(E_a)$$

- Recursive fitting procedure
- M_a = calculated physical masses of q bar-q mesons $\rightarrow$ reproduce experimental spectrum [PDG]
- Intrinsic error of QM/UQM calculations: 30-50 MeV

UQM: charmonium with self-energy corr.

- Parameters of the UQM ($^3P_0$ vertices)

Parameter	Value

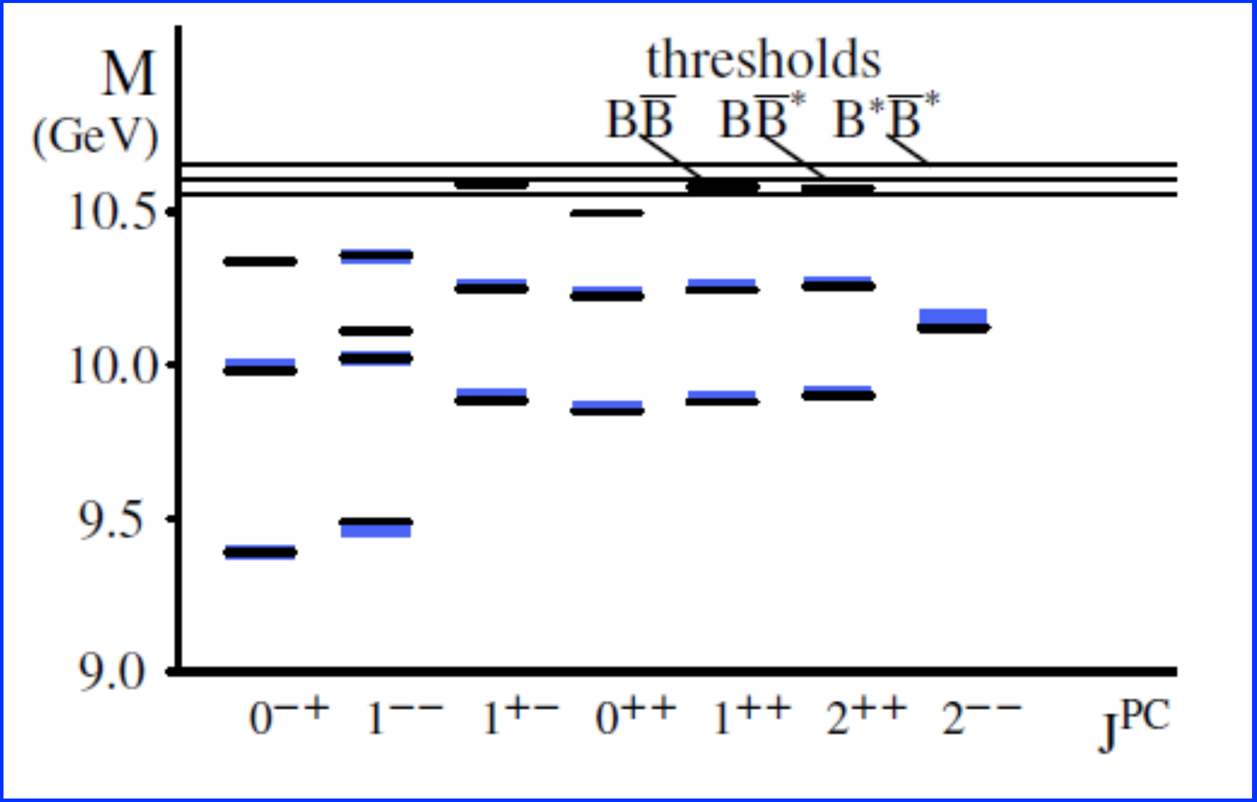
Bottomonium

Ferretti, Santopintio, Phys.Rev. D90 (2014) 9, 094022

- Results:



Couple Channels corrections to Bottomonium , the $\chi_b(3P)$ system

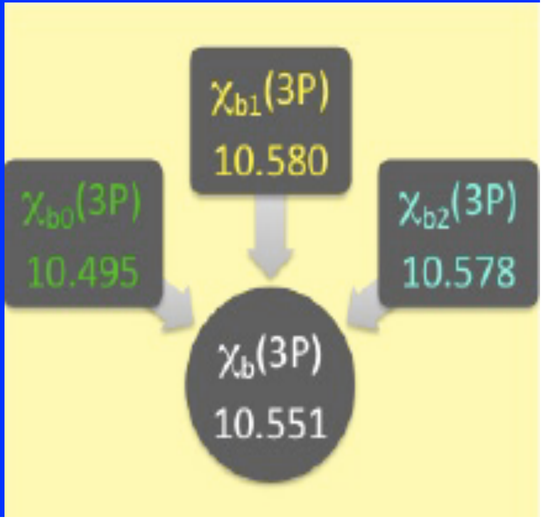
Ferretti, Santopintio, Phys.Rev. D90 (2014) 9, 094022

- Results used to study some properties of the $\chi_b(3P)$ system, meson multiplet with N=3, L=1 quantum numbers
- $\chi_b(3P)$ states close to first open bottom decay thresholds
- Possible importance of continuum coupling effects?
- Pure c bar-c and c bar-c + continuum effects interpretations
- Necessary to study decays (strong, e.m., hadronic, ...) to confirm one interpretation
-

Couple Channels corrections to Bottomonium , the $\chi_b(3P)$ system

Ferretti, Santopintio, Phys.Rev. D90 (2014) 9, 094022

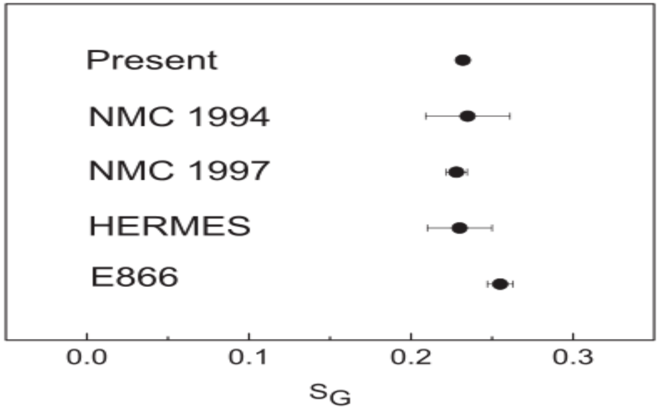
- Some experimental results for the mass barycenter of the system:
- $M[\chi_b(3P)] = 10.530 \pm 0.005$ (stat.) ± 0.009 (syst.) GeV
- Aad et al. [ATLAS Coll.], Phys. Rev. Lett. **108**, 152001 (2012)
- $M[\chi_b(3P)] = 10.551 \pm 0.014$ (stat.) ± 0.017 (syst.) GeV
- Abazov et al. [D0 Coll.], Phys. Rev. D 86, 031103 (2012)
- Mass barycenter in the UQM:



The Unquenched Quark Model

The UQM extends the QM by including the higher order Fock components in

the wave function.



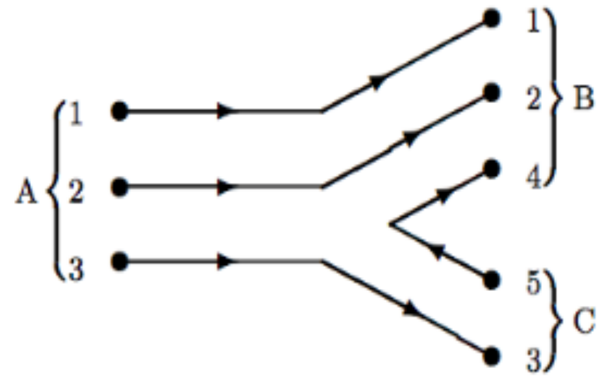
The evidence of the extra components has been found experimentally and it is in good agreement with the UQM, Santopinto, Bijker Rev. C 82 (2010) 062202.

The wave function is

$$|\psi_A\rangle = \mathcal{N}\left[|A\rangle + \sum_{BClJ}\int d\vec{K}dk\ k^2|BC\vec{K},k,lJ\rangle\frac{\langle BC\vec{K},k,lJ|T^\dagger|A\rangle}{M_A - E_B - E_C}\right]$$

The 3P0 vertex

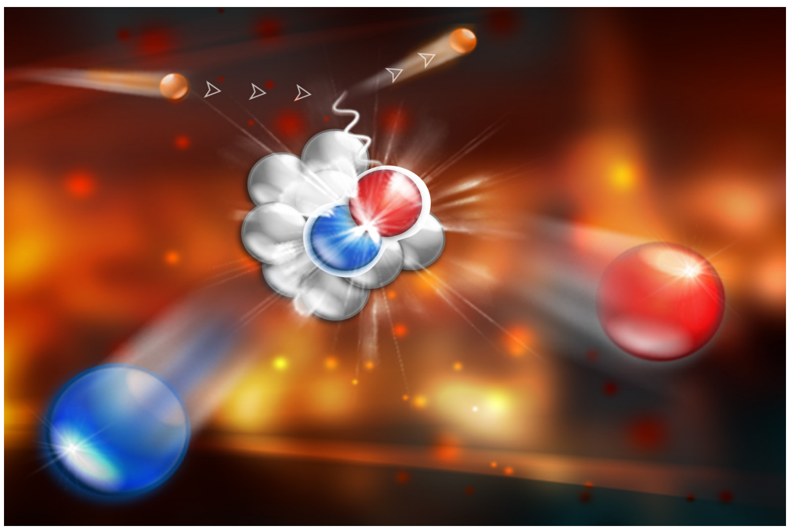
- The 3P0 pair-creation mechanism was introduced by Micu.
- The creation of additional qq pair with the quantum-vacuum numbers.
- The 3P0 operator is given by:



$$T^{\dagger} = -3\gamma_0 \int d\vec{p}_4\, d\vec{p}_5\, \delta(\vec{p}_4 + \vec{p}_5)\, C_{45}\, F_{45}\, V(\vec{p}_4 - \vec{p}_5)\, [\chi_{45} \times \mathcal{Y}_1(\vec{p}_4 - \vec{p}_5)]_0^{(0)}\, b_4^{\dagger}(\vec{p}_4)\, d_5^{\dagger}(\vec{p}_5)\ .$$

Electro-production of Baryon-meson resonances

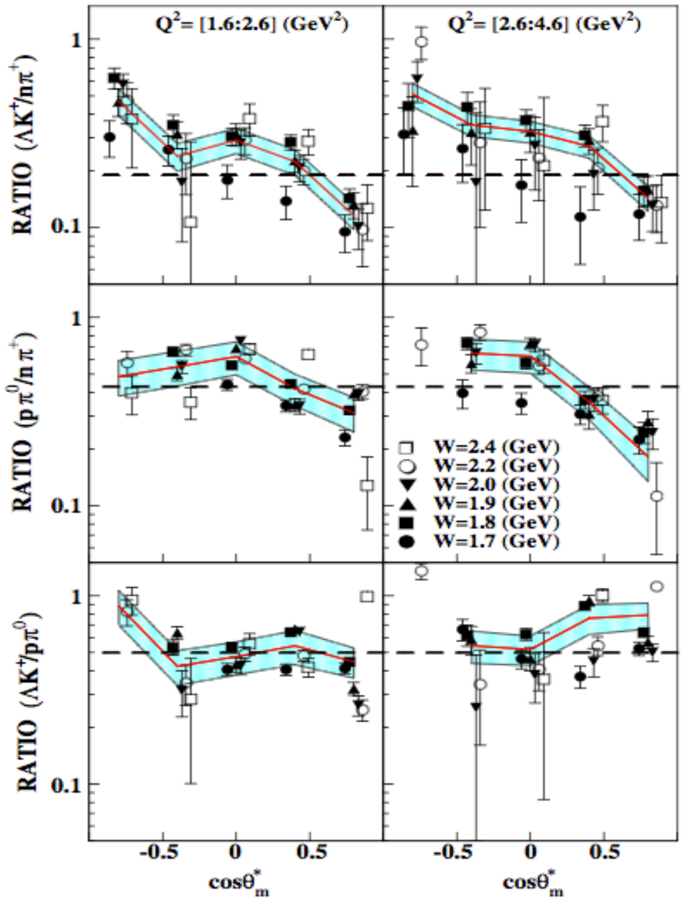
We applied the UQM formalism to describe the role of the sea quarks in the Baryon-Meson electro-production from proton at Jlab, Phys.Rev.Lett. 113 152004(2014).

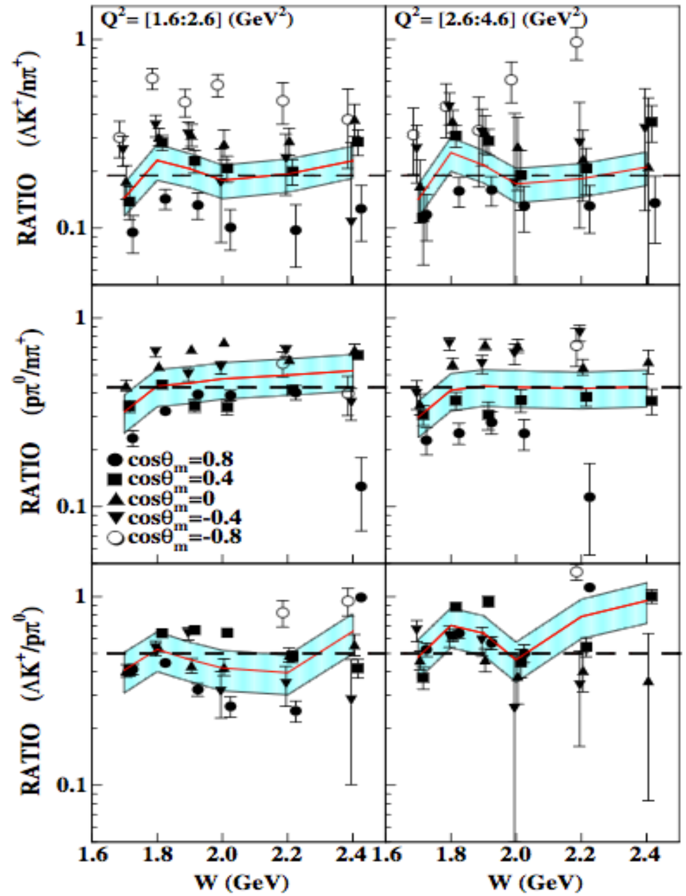


Jefferson Lab
Thomas Jefferson National Accelerator Facility

Electroproduction of Baryon-meson resonances

The experimental ratios are almost independent on the energy

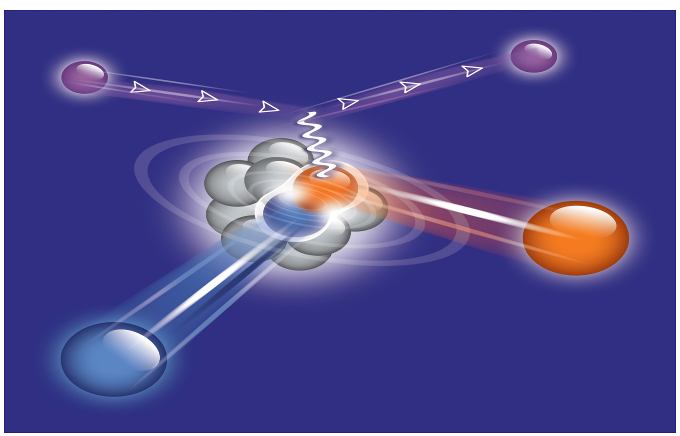




The branching ratios in the UQM of exclusive reactions

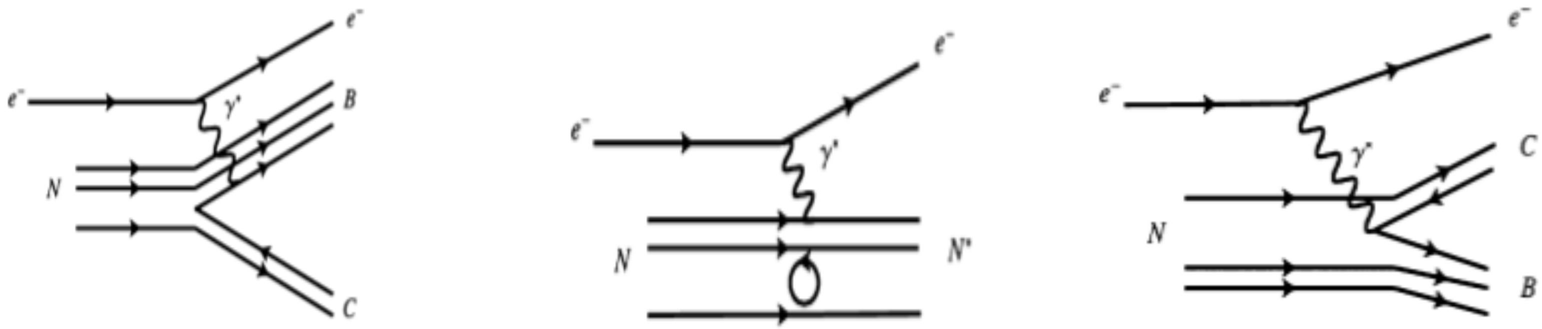
We can test our wave functions by computing the ratio of the Baryon-meson states in the electro-production and their relation with probabilities as follow

$$\frac{p \to \Lambda K^+}{p \to n\pi^+} \approx \frac{P(\Lambda K^+)}{P(n\pi^+)}$$ where the probability is $$P(BC) = |\langle BC|\psi_N\rangle|^2$$



Ratio	UQM	Exp.
$\Lambda K^+/n\pi^+$	0.227	$0,19 \pm 0,01 \pm 0,03$
$\Lambda K^+/p\pi^0$	0.454	$0,50 \pm 0,02 \pm 0,12$
$p\pi^0/n\pi^+$	0.5	$0,43 \pm 0,01 \pm 0,09$
$\Sigma^0 K^+/n\pi^+$	0.007	—
$\Sigma^0 K^+/p\pi^0$	0.014	—
$\Sigma^+ K^0/n\pi^+$	0.014	—
$\Sigma^+ K^0/p\pi^0$	0.028	—

Electro-production of Baryon-meson resonances



In inclusive reactions we do not consider the second diagram

The third diagram does not contribute if the final meson is pseudoscalar

The strange-suppression factor in the UQM

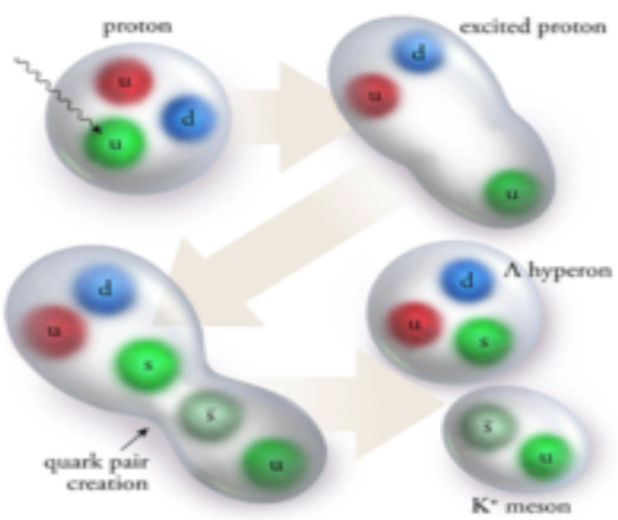
The extraction of the strange-suppression factor

$$\lambda_s = \frac{2(s\bar{s})}{(u\bar{u}) + (d\bar{d})},$$

$$q\bar{q} = \sum_{B_i C_i} \langle B_i C_i | \hat{P}(q\bar{q}) | N \rangle^2,$$

E.S., H.Garcia, R. Bijker, Phys.Lett. 214-217 B759 (2016)

Ratio	UQM[(1)]	UQM[(2)]	Exp.	Ref.
Proton				
$s\bar{s}/d\bar{d}$	0,27	0,25	$0,22 \pm 0,07$	PRL113,152004
$u\bar{u}/d\bar{d}$	0,57	0,57	$0,74 \pm 0,18$	PRL113,152004
$2s\bar{s}/(u\bar{u} + d\bar{d})$	0,34	0,31	$0,25 \pm 0,09$	PRL113,152004
			$0,29 \pm 0,02$	PLB 366,447
Neutron				
$s\bar{s}/u\bar{u}$	0,27	0,25		
$d\bar{d}/u\bar{u}$	0,57	0,57		
$2s\bar{s}/(u\bar{u} + d\bar{d})$	0,34	0,31		



The strange-suppression factor in the UQM vs PDF analysis

The integral of strange-suppression factor

$$\kappa_s(\mu^2) = \frac{\int_0^1 x[s(x,\mu^2) + \bar{s}(x,\mu^2)]dx}{\int_0^1 x[\bar{u}(x,\mu^2) + \bar{d}(x,\mu^2)]dx}$$

Alekhin et al. found that the integral is

0.62-0.68 at 20 GeV^2 PRD91 094002 (2015)

CMS Collaboration found 0.50- 0.54 PRD90 032004 (2014)

Conclusions

We used an extension of the quark model to describe the baryon-meson electro-production from proton target.

We found that the virtual components dominate the Baryon-meson electro-production. It is another evidence of the sea quarks of baryons, and the experimental data confirm this picture.

We extracted the strangeness-suppression factor and it is in good agreement with the new experimental data measured at JLab and Cern.

The strange content in proton is still unknown and it is debate topic.

Main points

- Unquenching quark model:we have constructed the formalism in an explicit way, also thanks to group theory tecniques. Now, it can be applied to any quark model.
- We think we have maked up the problems of quark models adding the coupling with the continuum, thus opening the possibilty of many, many applications

- Future: application to open problems in hadron structure and spectroscopy : helicity amplitudes, strong decays,and so on.
