'Exotic Branes' and Mixed-symmetry Potentials

Summary and Open Issues

Branes

Branes are extended objects with a number of **worldvolume** and **transverse** directions. They are an essential part of (non-perturbative) string theory

- The NS-NS 2-form B_2 suggests a **half-supersymmetric string**
- The 3-form C_3 of 11D sugra couples to a **half-susy M2-brane**

sugra potential \leftrightarrow *half-supersymmetric brane*

Does it always work as simple as that?

'Wess-Zumino term requirement'

the construction of a **gauge-invariant WZ term** requires, besides the embedding coordinates, the introduction of a number of **extra worldvolume p -form potentials**

We require **worldvolume supersymmetry**, i.e. these worldvolume fields must fit into a **multiplet with 16 supercharges**

Does the 'WZ term requirement' always lead to the rule that

potential \Leftrightarrow half-susy brane?

Input from Supergravity

- The T-duality representations of all **high-rank form potentials** have been determined using three different techniques:

- **closure** of the supersymmetry algebra

de Roo, Hartong, Howe, Kerstan, Ortín, Riccioni + E.B. (2005-2010)

- using the **embedding tensor** technique

for a review, see de Wit, Nicolai, Samtleben (2008)

- using the very extended Kac-Moody algebra E_{11}/E_{10}

West (2001); Riccioni, West (2007); Nutma + E.B. (2007); Damour, Henneaux, Nicolai (2002)

A scaling symmetry

All potentials transform as a representation of the **T-duality** group $O(d,d)$ and scale under a **scaling symmetry**

The **scaling weight** α determines the dependence of the brane tension T on the string coupling constant g_s via

$$T \sim (g_s)^\alpha$$

This scaling weight is invariant under **dimensional reduction**

A universal pattern arises

| α | potentials | branes |
|---------------|--|-------------|
| $\alpha = 0$ | $B_{1,A}, B_2$ | fundamental |
| $\alpha = -1$ | $C_{2n+1,a}, C_{2n,\dot{a}}$ | Dirichlet |
| $\alpha = -2$ | $D_{D-4}, D_{D-3,A}, D_{D-2,A_1A_2}, D_{D-1,A_1\cdots A_3}, D_{D,A_1\cdots A_4}$ | solitonic |
| \vdots | \vdots | \vdots |

$A (a, \dot{a})$ are vector (spinor)-indices of T-duality

$\alpha = -3$: S-dual of D7-brane

$\alpha = -4$: S-dual of D9-brane

Branes with $\alpha < -4$ have no ten-dimensional brane origin!

Question

*given a $(p + 1)$ -form potential which (components of its)
 T -duality repres. couple to a **half-supersymmetric brane**?*

Outcome Wess-Zumino Term Requirement

Riccioni + E.B. (2010)

There is a simple **group-theoretical characterization** of which (components of the) T-duality representation couple to a **half-supersymmetric brane**

- the (group-theoretical) details can be found in our papers
- **Comparing branes in different dimensions** an interesting set of **wrapping rules** emerge.

The Solitonic Wrapping Rules

the wrapping rules of **solitonic branes** are given by

$$T_S \sim (g_s)^{-2} : \quad \begin{cases} \text{wrapped} & \rightarrow \text{undoubled} \\ \text{unwrapped} & \rightarrow \text{doubled} \end{cases}$$

For instance, in **9D** we have **two** solitonic 5-branes coming from an un-wrapped NS5-brane and a **KK monopole**

$$\text{10D KK monopole:} \quad \begin{cases} 5 + 1 \text{ worldvolume directions} \\ 1 \text{ isometry direction} \\ 3 \text{ transverse directions} \end{cases}$$

Counting Solitonic Branes with $T \geq 3$

| Sp -brane | IIA/IIB | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|-------------|------------|---|---|---|---|-----------|----|---|
| 0 | | | | | | 1 | 12 | |
| 1 | | | | | 1 | 10 | | |
| 2 | | | | 1 | 8 | | | |
| 3 | | | 1 | 6 | | | | |
| 4 | | 1 | 4 | | | | | |
| 5 | 1/1 | 2 | | | | | | |

S(D-5)-brane and S(D-4)-brane_A

Solitonic Branes with $T \leq 2$

| Sp -brane | IIA/IIB | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|-------------|---------|---|---|----|----|----|-----|-----|
| 0 | | | | | | 1 | 12 | 84 |
| 1 | | | | | 1 | 10 | 60 | 280 |
| 2 | | | | 1 | 8 | 40 | 160 | 560 |
| 3 | | | 1 | 6 | 24 | 80 | 240 | |
| 4 | | 1 | 4 | 12 | 32 | 80 | | |
| 5 | 1/1 | 2 | 4 | 8 | 16 | | | |

The red numbers follow from imposing the **Wess-Zumino term requirement**

A Numerical Coincidence?

| Sp -brane | IIA/IIB | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|-------------|---------|---|---|----|----|----|-----|-----|
| 0 | | | | | | 1 | 12 | 84 |
| 1 | | | | | 1 | 10 | 60 | 280 |
| 2 | | | | 1 | 8 | 40 | 160 | 560 |
| 3 | | | 1 | 6 | 24 | 80 | 240 | |
| 4 | | 1 | 4 | 12 | 32 | 80 | | |
| 5 | 1/1 | 2 | 4 | 8 | 16 | | | |

Precisely the same numbers are reproduced by the **solitonic wrapping rule**!

Question

what is the 10D origin of the solitonic branes with $T \leq 2$?

Note: **extra input** is needed to fill up the T-duality representations!

standard supergravity is not sufficient!

Outline

Branes and p -form Potentials

'Exotic Branes' and Mixed-symmetry Potentials

Summary and Open Issues

Mixed-Symmetry Potentials

- At the level of (linearized) supergravity T-duality can be recovered by assuming that these theories can be extended with a set of **mixed-symmetry potentials** with an underlying **E_{10}/E_{11} -symmetry**
- To recover T-duality at the level of branes we assume that these **mixed symmetry potentials** are in one to one correspondence with extended objects called '**exotic branes**'. They have worldvolume, transverse and **special isometry directions**

see, e.g., Obers, Pioline (1999); Lozano-Tellechea, Ortín (2001)

see also work by de Boer and Shigemori (2010, 2012) → '**T-folds**'

A 7D Example

| | | |
|---------------|---|---------------------------------|
| $\alpha = -2$ | $D_3, D_{4,A}, D_{5,[AB]}, D_{6,[ABC]}, D_{7,[ABCD]}$ | $D_{6+n,n} (n = 0, 1, 2, 3, 4)$ |
|---------------|---|---------------------------------|

The 7D solitonic **domain wall** 6-forms $D_{6,[ABC]}$ ($A = 1, \dots, 6$) transform as 20 under $SO(3,3)$. These **6-forms** are dual to **(constant) fluxes**

| 10D origin | mixed-symmetry | flux ($a=1,2,3$) |
|-----------------|----------------|--------------------|
| NS5 (5_2) | D_6 | $H_{abc} (1)$ |
| KK5 (5_2^1) | $D_{7,1}$ | $f^a{}_{bc} (9)$ |
| 5_2^2 | $D_{8,2}$ | $Q^{ab}{}_c (9)$ |
| 5_2^3 | $D_{9,3}$ | $R^{abc} (1)$ |
| 5_2^4 | $D_{10,4}$ | — |

Brane WZ Terms and DFT

Where does $D_6 \equiv B_6$ fits into DFT ?

In SUGRA one can dualize B_2 into B_6 without dualizing the metric tensor $g_{\mu\nu}$ but in DFT B_2 is part of the **generalized metric \mathcal{H}_{MN}** !

Standard Dualization of Kalb-Ramond Field

standard : $S[b] = -\frac{1}{12} \int d^D x H_{abc} H^{abc}, \quad H_{abc} = 3\partial_{[a} b_{bc]}$

first – order : $S[D, H] = \int d^D x \left(-\frac{1}{12} H_{abc} H^{abc} + D^{abcd} \partial_a H_{bcd} \right)$

$$\delta D^{abcd} = \partial_e \Sigma^{eabcd}$$

(E.o.M) $\partial_{[a} G_{bcd]} = 0, \quad G^{abc} = \partial_d D^{dabc}$

(B.I.) $\partial_a G^{abc} = 0$

Exotic Dualization

Hull (2001); Boulanger, Sundell, West (2015)

$$S[b] = -\frac{1}{12} \int d^D x H^{abc} H_{abc} = -\frac{1}{4} \int d^D x (\partial^a b^{bc} \partial_a b_{bc} - 2 \partial_a b^{ab} \partial^c b_{cb})$$

$$S[Q, D] = \int d^D x \left(-\frac{1}{4} Q^{a|bc} Q_{a|bc} + \frac{1}{2} Q_{a|}{}^{ab} Q^c{}_{cb} - \frac{1}{2} D^{ab|cd} \partial_a Q_{b|cd} \right)$$

$$\partial_{[a} Q_{b]|cd} = 0 \quad \Rightarrow \quad Q_{a|bc} = \partial_a b_{bc}$$

We now have a mixed-symmetry potential $D^{ab|cd} \stackrel{D=10}{\sim} D_{8,2}!$

Linearized DFT

Use formulation with **generalized fluxes** \mathcal{F}_{ABC}

Aldazabal, Baron, Marques, Nunez (2011); Geissbuhler (2011)

Grana, Marques (2011); Geissbuhler, Marques, Nunez, Penas (2013)

Duality leads to **4-form potential** D^{ABCD}

Hohm, Penas, Riccioni + E.B. (2016)

$$D^{\mu_1 \cdots \mu_4} \rightarrow B_6$$

$$D^{\mu_1 \cdots \mu_3}_{\mu_4} \rightarrow h_{7,1}$$

$$D^{\mu_1 \mu_2}_{\mu_3 \mu_4} \rightarrow D_{8,2}$$

$$D^{\mu_1}_{\mu_2 \cdots \mu_4} \rightarrow D_{9,3}$$

$$D_{\mu_1 \cdots \mu_4} \rightarrow D_{10,4}$$

Can we define **brane WZ terms** in DFT?

$\alpha = -2$: solitonic 5-brane WZ terms

Blair and Musaev (2017)

$$\int d^6\xi \, q_{M_1 \dots M_{10}} D^{M_1 \dots M_4} \mathcal{D}_{a_1} X^{M_5} \dots \mathcal{D}_{a_6} X^{M_{10}} \epsilon^{a_1 \dots a_6} \quad \text{with}$$

$$\mathcal{D}_a X^M = \partial_a X^M - K^{-2} K_\alpha^M K_N^\alpha \partial_a X^N,$$

$$q_{M_1 \dots M_{10}} = Q \epsilon_{\nu_1 \dots \nu_{10}} \frac{\partial Z^{\nu_1}}{\partial X^{M_1}} \dots \frac{\partial Z^{\nu_{10}}}{\partial X^{M_{10}}}$$

- **NS 5-brane:** $q_{M_1 \dots M_{10}} = Q \epsilon_{m_1 \dots m_{10}}$ otherwise zero $\rightarrow D_6$
- **KK-monopole:** $q_{M_1 \dots M_{10}} = Q \epsilon_{\nu_1 \dots \nu_{10}} K_{M_1}^{\nu_1} \delta_{M_2}^{\nu_2} \dots \delta_{M_{10}}^{\nu_{10}}$ $\rightarrow D_{6,x}$

DFT Potentials

- $\alpha = 0$: B_{MN}
- $\alpha = -1$: C_α
- $\alpha = -2$: D_{MNPQ}
- $\alpha = -3$: $E_{MN\alpha}$
- $\alpha = -4$: $F_{M_1 \dots M_{10}}^+$, $F_{M_1 \dots M_4, N_1 N_2}$, $F_{M_1 \dots M_7, N}$
- \vdots

What are the brane WZ terms within DFT?

Outline

Branes and p -form Potentials

'Exotic Branes' and Mixed-symmetry Potentials

Summary and Open Issues

Summary

- In this talk I reviewed the classification of the potentials and branes of maximal supergravity using the **Wess-Zumino term requirement** and showed how this suggests the introduction of **mixed-symmetry potentials** and **exotic branes**
- all branes satisfy **simple wrapping rules!**
- I reported on some progress in how to describe these Wess-Zumino terms within DFT. More work remains to be done!

Take Home Message

Can we understand the role of **mixed-symmetry potentials** better?

See, e.g., Bunster, Henneaux (2013)

Thanks for your Attention !
