# T-duality transformations along angular directions for the NS5-brane

*jeudi 18 janvier 2018 16:20 (20 minutes)*

I review the uncompactified NS5-brane solution and define in addition to the H-flux a geometric charge for this background. Under T-duality these charge are interchanged, and supersymmetry will be partially broken. These results are compared to the compactified-and-smearred solution, which shows very different behaviour.
