

# Retriggers vs plane events: when a good hit is present

badevents\_ifhit\_samechip\_dif\_dif\_1\_1\_2

bcid\_samechip\_dif\_dif\_1\_1\_2

■ Dif\_1\_1\_2, grid00

■ Selection:

- Good hits are selected firstly.
- Then, bad hits are search in **THE SAME** chip, **different channel** were the good hit was generated
- Only chip15 for the good hit counting !!
- bcid are compared (within a spill)

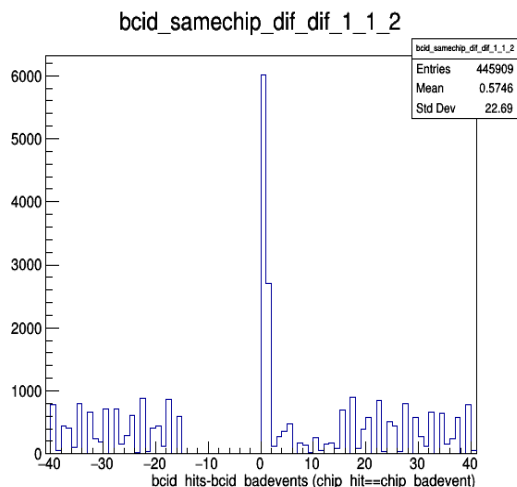

■ Badbcid == retrigger and/or plane event

■ In the same chip, there is no correlation between triggers and following retriggers

# Retriggers vs plane events: when a good hit is present

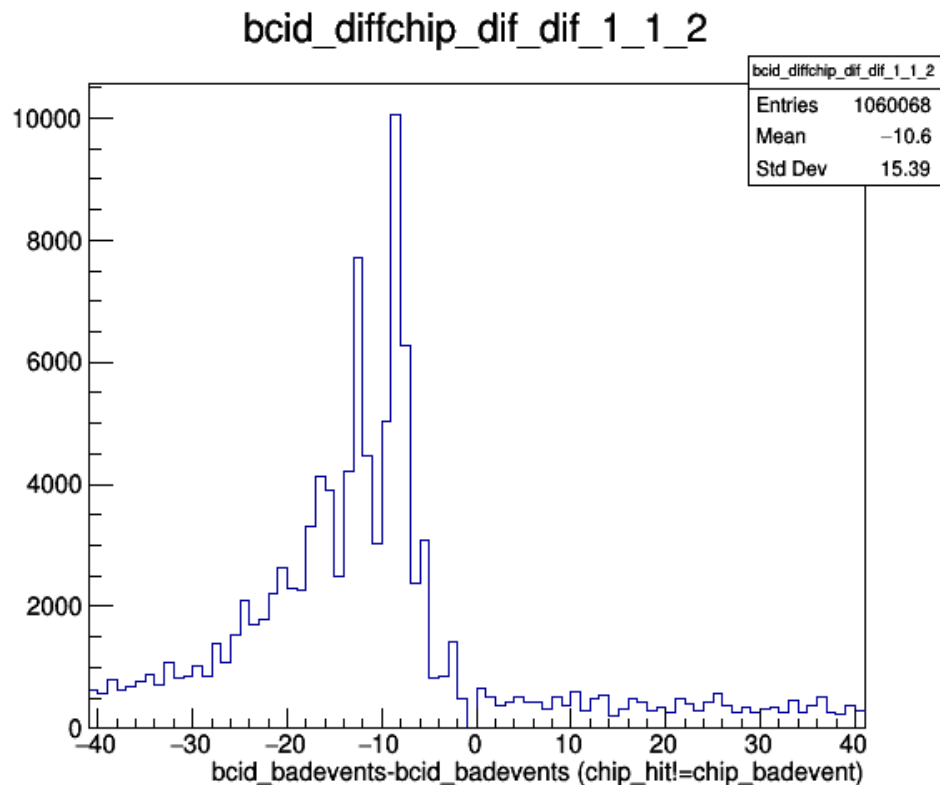

ADC distribution of bad events in the ~zero peak

- The hit maps shows the bad events location if we had a good event in any other channel.
- The peak at zero looks like two electrons in the beam (?)
  - No because the ADC spectrum (leftmost plot) looks basically like pedestal (with very few entry in the MIP area)
  - ADC for all channels/sca
- BADBCID for these events is  $\sim=3$
- $isca(\text{bad}) \sim= isca(\text{good}) - 1$ 
  - Just before (one bcid, one sca) a good hit, we have a retrigger entry in other channel in the same chip... how ??
- I suspect that I am still tagging some bad events as good events ... **NEED TO CHECK THE CONVERTER.**

# Retriggers vs plane events: when a good hit is present

## ■ Dif\_1\_1\_2, grid00

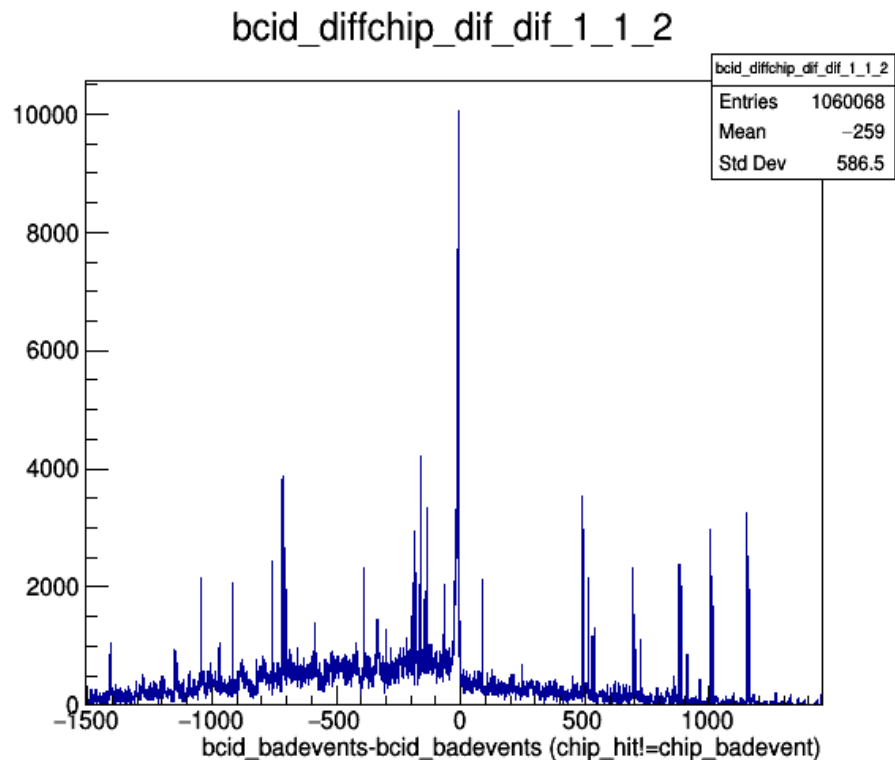

## ■ Selection:

- Good hits are selected firstly.
- Then, bad hits are search in A DIFFERENT chip were the good hit was generated
- Only chip15 for the good hit counting !!
- bcid are compared (within a spill)

## ■ Badbcid == retrigger and/or plane event

## ■ Clear Pattern: 3,6,9,12,15 bcids after a hit, we see retriggers in other chips

# Retriggers vs plane events: when a good hit is present

■ Dif\_1\_1\_2, grid00

■ Selection:

- Good hits are selected firstly.
- Then, bad hits are search in A DIFFERENT chip were the good hit was generated
- Only chip15 for the good hit counting !!
- bcid are compared (within a spill)

■ Badbcid == retrigger and/or plane event

■ Unzooming:

■ More complicated pattern !!

# Retriggers vs plane events: when a good hit is present

- The bad events seem to be localized in few channels (i.e. the cross in chip 11)

ADC distribution of bad events

- What if we exclude chip 11?

ADC distribution of bad events

# Retriggers vs plane events: when a BAD hit is present

- Same than before, but compare bad events with bad events. For same chip and different
  - including all chips, not only 15
