Lepton distribution from top-quark

A probe of new physics and top-polarization

at

Rencontres de Moriond EW 2007

10 – 17 March, 2007

top-quark : A looking glass

The mass of the top-quark is very large ($m_t \sim 175$ GeV)

- top-mass being close to electro-weak scale, its couplings are sensitive to EWSB. Any new physics of EWSB (or mass generation) affects top-couplings with other particles.

top-quark : A looking glass

The mass of the top-quark is very large ($m_t \sim 175$ GeV)

- top-mass being close to electro-weak scale, its couplings are sensitive to EWSB. Any new physics of EWSB (or mass generation) affects top-couplings with other particles.
- its decay width ($\Gamma_t \sim 1.5$ GeV) is much larger than the typical scale of hadronization, i.e. it decays before getting hadronized. The spin information of top-quark is translated to the decay distribution.

top-quark : A looking glass

The mass of the top-quark is very large ($m_t \sim 175$ GeV)

- top-mass being close to electro-weak scale, its couplings are sensitive to EWSB. Any new physics of EWSB (or mass generation) affects top-couplings with other particles.
- its decay width ($\Gamma_t \sim 1.5$ GeV) is much larger than the typical scale of hadronization, i.e. it decays before getting hadronized. The spin information of top-quark is translated to the decay distribution.
- the decay lepton angular distribution is insensitive to the anomalous tbW couplings, and hence a pure probe of new physics in top-production process; observed for top-pair production at e^+e^- (Rindani, Grzadkowski) as well as $\gamma\gamma$ collider (Ohkuma, Godbole).

top-quark : A looking glass

- top-mass being close to electro-weak scale, its couplings are sensitive to EWSB. Any new physics of EWSB (or mass generation) affects top-couplings with other particles.
- its decay width ($\Gamma_t \sim 1.5$ GeV) is much larger than the typical scale of hadronization, i.e. it decays before getting hadronized. The spin information of top-quark is translated to the decay distribution.
- the decay lepton angular distribution is insensitive to the anomalous tbW couplings, and hence a pure probe of new physics in top-production process; observed for top-pair production at e^+e^- (Rindani, Grzadkowski) as well as $\gamma\gamma$ collider (Ohkuma, Godbole).
- top-decay products provide a **clean** and **un-contaminated** probe of top-production mechanism.

top-quark : A looking glass

The mass of the top-quark is very large ($m_t \sim 175$ GeV)

- top-mass being close to electro-weak scale, its couplings are sensitive to EWSB. Any new physics of EWSB (or mass generation) affects top-couplings with other particles.
- its decay width ($\Gamma_t \sim 1.5$ GeV) is much larger than the typical scale of hadronization, i.e. it decays before getting hadronized. The spin information of top-quark is translated to the decay distribution.
- the decay lepton angular distribution is insensitive to the anomalous tbW couplings, and hence a pure probe of new physics in top-production process; observed for top-pair production at e^+e^- (Rindani, Grzadkowski) as well as $\gamma\gamma$ collider (Ohkuma, Godbole).
- top-decay products provide a **clean** and **un-contaminated** probe of top-production mechanism.

We have a clean looking glass for new physics.

Anomalous t-decay

Anomalous tbW vertex :

$$\Gamma^\mu = \frac{g}{\sqrt{2}} \left[\gamma^\mu (f_{1L} P_L + f_{1R} P_R) - \frac{i\sigma^{\mu\nu}}{m_W} (p_t - p_b)_\nu \, (f_{2L} P_L + f_{2R} P_R) \right]$$

Anomalous t-decay

Anomalous tbW vertex :

$$\Gamma^\mu = \frac{g}{\sqrt{2}} \left[\gamma^\mu (f_{1L} P_L + f_{1R} P_R) - \frac{i\sigma^{\mu\nu}}{m_W} (p_t - p_b)_\nu \, (f_{2L} P_L + f_{2R} P_R) \right]$$

- In the SM, $f_{1L} = 1$, $f_{1R} = 0$, $f_{2L} = 0$, $f_{2R} = 0$.
- Contribution from $f_{1R},\ f_{2L}$ are proportional to m_b.

Lepton distribution

$$AB \longrightarrow t \; P_1 \ldots P_{n-1}$$

$$t \longrightarrow b \; W^+$$

$$W^+ \longrightarrow l^+ \nu$$

Lepton distribution is independent of anomalous tbW coupling if

- t-quark is on-shell; narrow-width approximation for t-quark,

Lepton distribution

$$AB \longrightarrow t \; P_1 \ldots P_{n-1}$$
$$\quad \hookrightarrow b \; W^+$$
$$\qquad \hookrightarrow l^+ \nu$$

Lepton distribution is independent of anomalous tbW coupling if

- t-quark is on-shell; narrow-width approximation for t-quark,
- anomalous couplings $f_{1R},\ f_{2R}$ and f_{2L} are small,

Lepton distribution

$$AB \longrightarrow t \; P_1 \ldots P_{n-1}$$
$$t \longrightarrow b \; W^+$$
$$W^+ \longrightarrow l^+ \nu$$

Lepton distribution is independent of anomalous tbW coupling if

- t-quark is on-shell; narrow-width approximation for t-quark,
- anomalous couplings f_{1R}, f_{2R} and f_{2L} are small,
- narrow-width approximation for W-boson,

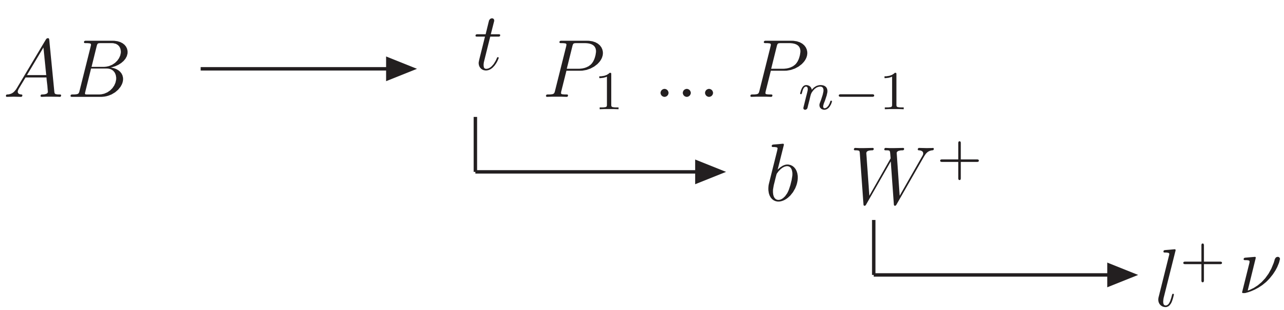
Lepton distribution

$$AB \longrightarrow t \; P_1 \ldots P_{n-1}$$
$$t \longrightarrow b \; W^+$$
$$W^+ \longrightarrow l^+ \nu$$

Lepton distribution is independent of anomalous tbW coupling if

- t-quark is on-shell; narrow-width approximation for t-quark,
- anomalous couplings f_{1R}, f_{2R} and f_{2L} are small,
- narrow-width approximation for W-boson,
- b-quark is mass-less,

Lepton distribution



Lepton distribution is independent of anomalous tbW coupling if

- t-quark is on-shell; narrow-width approximation for t-quark,
- anomalous couplings f_{1R}, f_{2R} and f_{2L} are small,
- narrow-width approximation for W-boson,
- b-quark is mass-less,
- $t \to bW(\ell\nu_\ell)$ is the only decay channel for t-quark.

Decay distribution

Narrow-width approximation for t-quark $\Rightarrow$

$$\overline{|\mathcal{M}|^2} = \frac{\pi\delta(p_t^2 - m_t^2)}{\Gamma_t m_t} \sum_{\lambda,\lambda'} \rho(\lambda,\lambda')\Gamma(\lambda,\lambda')$$

where,

$$\rho(\lambda,\lambda') = M_\rho(\lambda)\, M_\rho^*(\lambda') \quad \text{and} \quad \Gamma(\lambda,\lambda') = M_\Gamma(\lambda)\, M_\Gamma^*(\lambda').$$

Decay distribution

Narrow-width approximation for t-quark $\Rightarrow$

$$\overline{|\mathcal{M}|^2} = \frac{\pi\delta(p_t^2 - m_t^2)}{\Gamma_t m_t} \sum_{\lambda,\lambda'} \rho(\lambda,\lambda')\Gamma(\lambda,\lambda')$$

where,

$$\rho(\lambda,\lambda') = M_\rho(\lambda)\, M_\rho^*(\lambda') \quad \text{and} \quad \Gamma(\lambda,\lambda') = M_\Gamma(\lambda)\, M_\Gamma^*(\lambda').$$

$$\begin{aligned} d\sigma &= \sum_{\lambda,\lambda'} \left[\frac{(2\pi)^4}{2I} \rho(\lambda,\lambda') \delta^4(k_A + k_B - p_t - \sum_i^{n-1} p_i) \frac{d^3 p_t}{2E_t (2\pi)^3} \prod_i^{n-1} \frac{d^3 p_i}{2E_i (2\pi)^3} \right] \\ &\times \left[\frac{1}{\Gamma_t} \left(\frac{(2\pi)^4}{2m_t} \Gamma(\lambda,\lambda') \delta^4(p_t - p_b - p_\nu - p_\ell) \frac{d^3 p_b}{2E_b (2\pi)^3} \frac{d^3 p_\nu}{2E_\nu (2\pi)^3} \right) \frac{d^3 p_\ell}{2E_\ell (2\pi)^3} \right]. \end{aligned}$$

Decay distribution

Production part ($\phi_t = 0$) :

$$\int \frac{d^3 p_t}{2E_t (2\pi)^3} \prod_i^{n-1} \frac{d^3 p_i}{2E_i (2\pi)^3} \; \frac{(2\pi)^4}{2I} \rho(\lambda, \lambda') \delta^4 \left(k_A + k_B - p_t - \left(\sum_i^{n-1} p_i \right) \right)$$

$$= d\sigma_{2 \to n}(\lambda, \lambda') \; dE_t \; d\cos\theta_t .$$

Decay distribution

Production part ($\phi_t = 0$) :

$$\int \frac{d^3p_t}{2E_t(2\pi)^3} \prod_i^{n-1} \frac{d^3p_i}{2E_i(2\pi)^3} \; \frac{(2\pi)^4}{2I} \rho(\lambda, \lambda') \delta^4\left(k_A + k_B - p_t - \left(\sum_i^{n-1} p_i\right)\right)$$

$$= d\sigma_{2\to n}(\lambda, \lambda') \, dE_t \, d\cos\theta_t .$$

Decay part (in rest rest frame of t-quark) :

$$\frac{1}{\Gamma_t} \frac{(2\pi)^4}{2m_t} \int \frac{d^3p_\ell}{2E_\ell(2\pi)^3} \; \frac{d^3p_b}{2E_b(2\pi)^3} \; \frac{d^3p_\nu}{2E_\nu(2\pi)^3} \; \Gamma(\lambda, \lambda') \delta^4(p_t - p_b - p_\nu - p_\ell)$$

$$= \frac{1}{32\Gamma_t m_t} \; \frac{E_\ell}{(2\pi)^4} \frac{\langle \Gamma(\lambda, \lambda') \rangle}{m_t E_\ell} \; dE_\ell \; d\Omega_\ell \; dp_W^2 \; .$$

Angular brackets stands for averaging over $\phi = (\phi_b - \phi_\ell)$.

Decay density matrix

In the rest frame of t-quark, we have

$$\langle\Gamma(\pm,\pm)\rangle = g^4 m_t E_\ell^0 \, |\Delta_W(p_W^2)|^2 \, (1 \pm \cos\theta_l) \times F(E_\ell^0),$$
$$\langle\Gamma(\pm,\mp)\rangle = g^4 m_t E_\ell^0 \, |\Delta_W(p_W^2)|^2 \, (\sin\theta_l e^{\pm i\phi_l}) \times F(E_\ell^0).$$

where $\Delta_W(p_W^2) = \frac{1}{p_W^2 - m_W^2 + i\Gamma_W m_W}$

$$F(E_\ell^0) = \Bigg[(m_t^2 - m_b^2 - 2p_t \cdot p_l)\left(|f_{1L}|^2 + \Re(f_{1L} f_{2R}^*)\frac{m_t}{m_W}\frac{p_W^2}{p_t.p_l}\right) - 2\Re(f_{1L} f_{2L}^*)\frac{m_b}{m_W} p_W^2 - \Re(f_{1L} f_{1R}^*)\frac{m_b \, m_t}{p_t.p_l} p_W^2\Bigg]$$

In general,

$$\langle\Gamma(\lambda,\lambda')\rangle = (m_t E_\ell^0)\,|\Delta(p_W^2)|^2 \, g^4 \, A(\lambda,\lambda') \, F(E_\ell^0)$$

Angular distribution of lepton

Combining production and decay part, we have

$$
\begin{aligned}
d\sigma &= \frac{1}{32\,\Gamma_t m_t (2\pi)^4}\left[\sum_{\lambda,\lambda'} d\sigma_{2\to n}(\lambda,\lambda') \;\times\; g^4 A^{c.m.}(\lambda,\lambda')\right] \\
&\times \quad dE_t\; d\cos\theta_t\; d\cos\theta_\ell\; d\phi_\ell \\
&\times \quad E_\ell\; F(E_\ell)\; |\Delta(p_W^2)|^2\; dE_\ell\; dp_W^2
\end{aligned}
$$

and

$$
\Gamma_t \propto \int E_\ell\; F(E_\ell)\; |\Delta(p_W^2)|^2\; dE_\ell\; dp_W^2
$$

Contribution from anomalous tbW couplings cancels between numerator and denominator, if $t \to bW$ is the only decay channel.

$\Rightarrow$ Lepton angular distribution is independent of anomalous tbW interactions.

Energy distribution of lepton

The E_ℓ distribution (in the lab frame) depends both on

- anomalous tbW couplings $\Rightarrow$ **new physics in t-decay**
- energy-angular distribution of t-quark $\Rightarrow$ **new physics in t-production**

Energy distribution of lepton

The E_ℓ distribution (in the lab frame) depends both on

• anomalous tbW couplings $\Rightarrow$ **new physics in t-decay**

• energy-angular distribution of t-quark $\Rightarrow$ **new physics in t-production**

The E_ℓ^0 distribution (in the top-rest-frame) depends only on the possible **new physics in t-decay.**

$$\frac{d\sigma}{dE_\ell^0} \propto \int E_l^0 F(E_l^0)\, |\Delta(p_W^2)|^2\, dp_W^2$$

Independent of production mechanism of t-quark !!

Polarization of t-quark

Polarized cross-sections :

$$\int \frac{d^3 p_t}{2E_t (2\pi)^3} \left(\prod_{i=1}^{n-1} \frac{d^3 p_i}{2E_i (2\pi)^3} \right) \frac{(2\pi)^4}{2I} \rho(\lambda, \lambda') \; \delta^4 \left(k_A + k_B - p_t - \left(\sum_{i=1}^{n-1} p_i \right) \right) = \sigma(\lambda, \lambda').$$

Polarization of t-quark

Polarized cross-sections :

$$\int \frac{d^3p_t}{2E_t(2\pi)^3} \left(\prod_{i=1}^{n-1} \frac{d^3p_i}{2E_i(2\pi)^3} \right) \frac{(2\pi)^4}{2I} \rho(\lambda, \lambda') \; \delta^4 \left(k_A + k_B - p_t - \left(\sum_{i=1}^{n-1} p_i \right) \right) = \sigma(\lambda, \lambda').$$

Total cross-section :

$$\sigma_{tot} = \sigma(+,+) + \sigma(-,-)$$

Polarization of t-quark

Polarized cross-sections :

$$\int \frac{d^3p_t}{2E_t(2\pi)^3} \left(\prod_{i=1}^{n-1} \frac{d^3p_i}{2E_i(2\pi)^3} \right) \frac{(2\pi)^4}{2I} \rho(\lambda, \lambda') \; \delta^4 \left(k_A + k_B - p_t - \left(\sum_{i=1}^{n-1} p_i \right) \right) = \sigma(\lambda, \lambda').$$

Total cross-section :

$$\sigma_{tot} = \sigma(+,+) + \sigma(-,-)$$

Polarization density matrix :

$$P_t = \frac{1}{2} \begin{pmatrix} 1 + \eta_3 & \eta_1 - i\eta_2 \\ \eta_1 + i\eta_2 & 1 - \eta_3 \end{pmatrix},$$

$$\begin{aligned} \eta_3 &= \left(\sigma(+,+) - \sigma(-,-) \right) / \sigma_{tot} \\ \eta_1 &= \left(\sigma(+,-) + \sigma(-,+) \right) / \sigma_{tot} \\ i\, \eta_2 &= \left(\sigma(+,-) - \sigma(-,+) \right) / \sigma_{tot} \end{aligned}$$

Polarization of t-quark

Polarization through leptonic decay of t-quark :

$$\frac{\eta_3}{2} = \frac{\sigma(p_\ell.s_3 < 0) - \sigma(p_\ell.s_3 > 0)}{\sigma(p_\ell.s_3 < 0) + \sigma(p_\ell.s_3 > 0)}$$

$$\frac{\eta_2}{2} = \frac{\sigma(p_\ell.s_2 < 0) - \sigma(p_\ell.s_2 > 0)}{\sigma(p_\ell.s_2 < 0) + \sigma(p_\ell.s_2 > 0)}$$

$$\frac{\eta_1}{2} = \frac{\sigma(p_\ell.s_1 < 0) - \sigma(p_\ell.s_1 > 0)}{\sigma(p_\ell.s_1 < 0) + \sigma(p_\ell.s_1 > 0)}$$

$$s_i.s_j = -\delta_{ij} \qquad p_t.s_i = 0$$

For $p_t^\mu = E_t(1, \beta_t \sin\theta_t, 0, \beta_t \cos\theta_t)$, we have

$$s_1^\mu = (0, -\cos\theta_t, 0, \sin\theta_t),\ s_2^\mu = (0, 0, 1, 0),\ s_3^\mu = E_t(\beta_t, \sin\theta_t, 0, \cos\theta_t)/m_t.$$

Polarization of t-quark

η_2 : transverse polarization normal to the production plane.

Simplest quantity to measure;

requires reconstruction of t-production plane;

Polarization of t-quark

η_2 : transverse polarization normal to the production plane.

Simplest quantity to measure;

requires reconstruction of t-production plane;

η_1 : transverse polarization in the production plane.

requires reconstruction of t-production plane and $\cos\theta_t$;

Polarization of t-quark

η_2 : transverse polarization normal to the production plane.

Simplest quantity to measure;

requires reconstruction of t-production plane;

η_1 : transverse polarization in the production plane.

requires reconstruction of t-production plane and $\cos\theta_t$;

η_3 : average helicity.

requires reconstruction of t-production plane, $\cos\theta_t$ and E_t;

Polarization of t-quark

η_2 : transverse polarization normal to the production plane.

η_1 : transverse polarization in the production plane.
requires reconstruction of t-production plane and $\cos\theta_t$;

η_3 : average helicity.
requires reconstruction of t-production plane, $\cos\theta_t$ and E_t;

Angular distribution in lab frame can be used as a qualitative measure of the t-polarization.

Polarization through angular distribution

For demonstration, we chose $\gamma\gamma \to t\bar{t}$ process with/without Higgs exchange contribution.

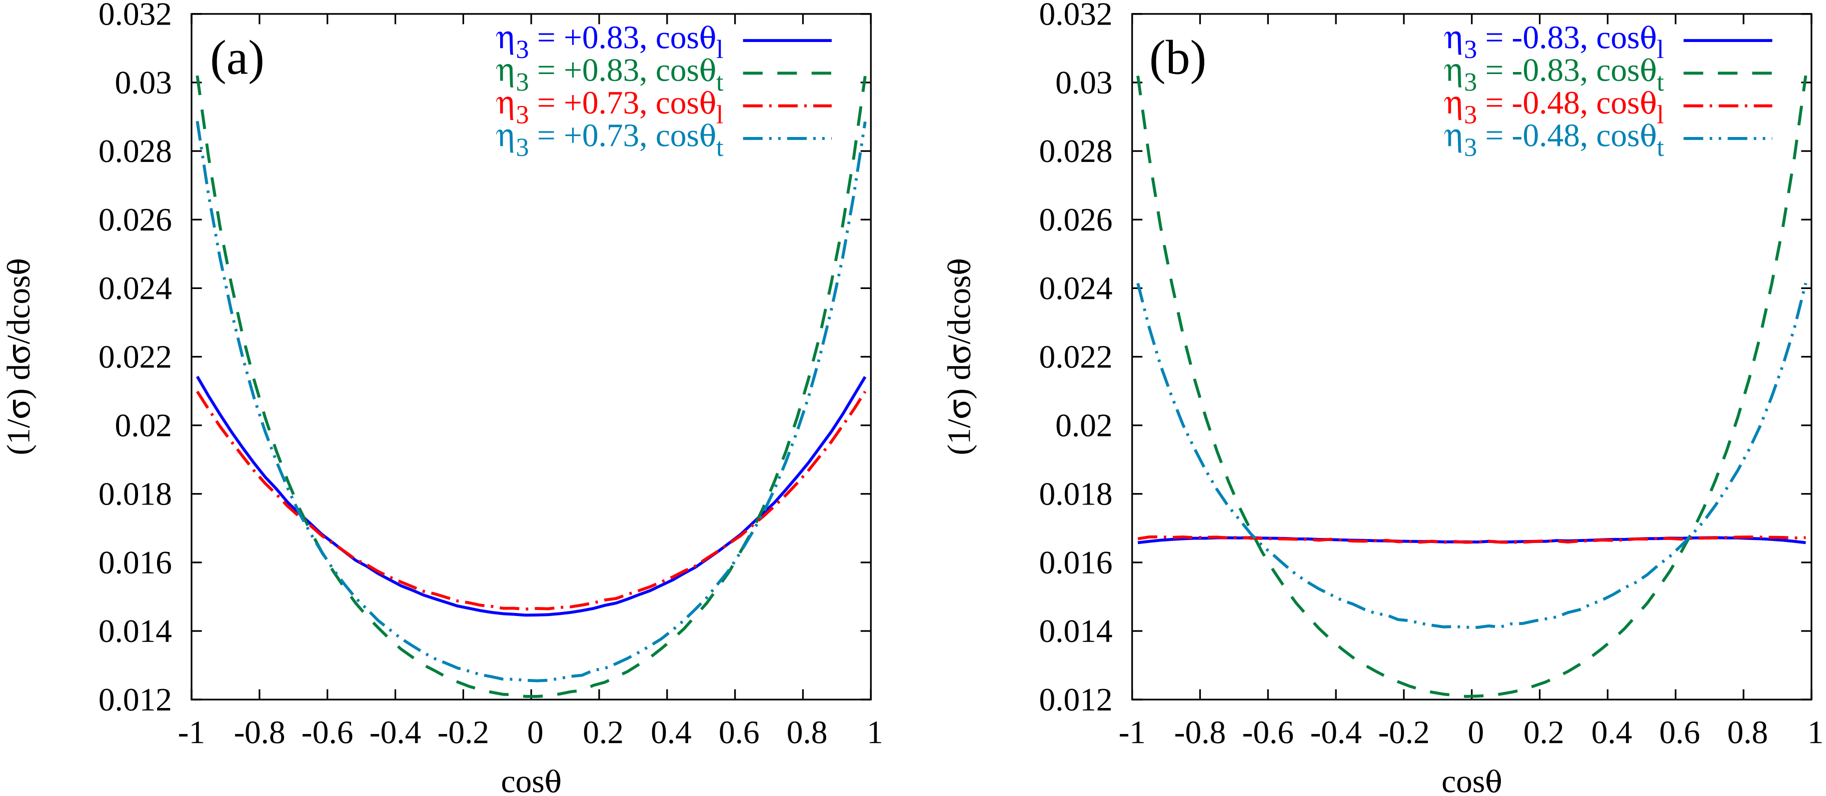
$m_\phi = 500$ GeV; $\Gamma_\phi = 2.5$ GeV,
$S_t = 0.2,\ P_t = 0.4,\ S_\gamma = 4.0 + i\,0.5$ and $P_\gamma = 1.25 + i\,2.0$.

Polarized ideal photon spectrum is used.

Assumptions :

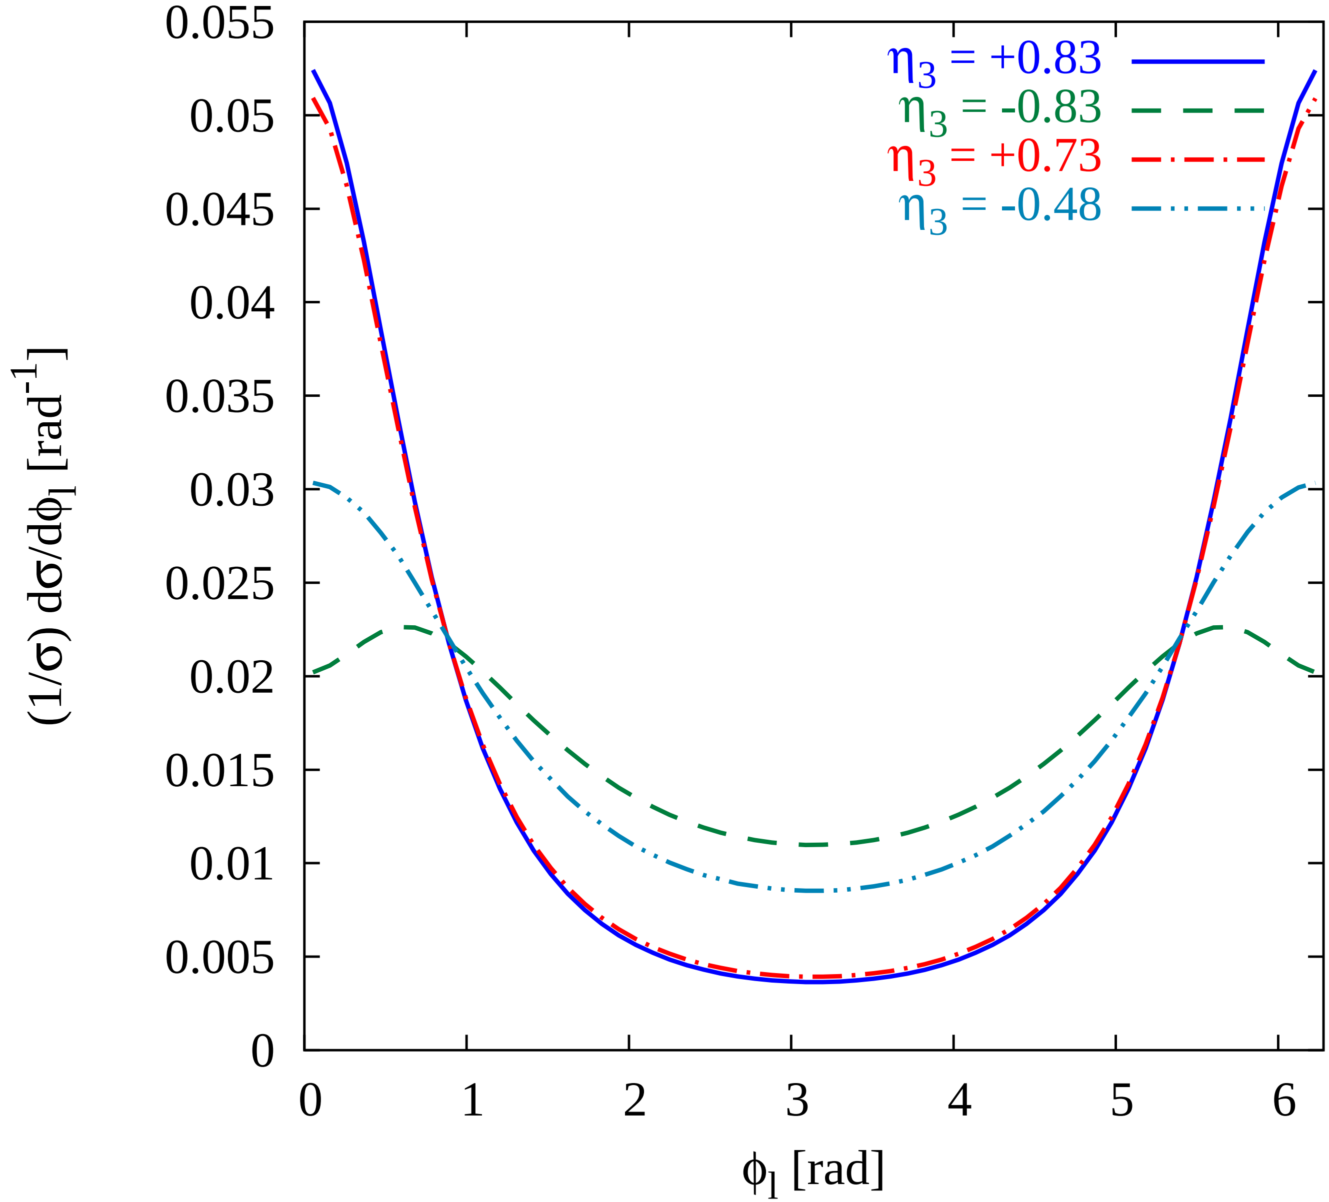
- t-quark is on-shell
- anomalous tbW couplings are small
- W-boson is on-shell
- b-quark is mass-less and
- $t \to bW$ is the only decay channel for t-decay

Polarization through angular distribution



$\eta_1 = 0$ and $\eta_2 = 0$

Polarization through angular distribution



Conclusions

- Lepton angular distribution is a **pure** probe of possible new physics in **any** process of t-quark production, independent of possible new physics in t-decay.

Conclusions

- Lepton angular distribution is a **pure** probe of possible new physics in **any** process of t-quark production, independent of possible new physics in t-decay.
- Lepton energy distribution, in the t-rest-frame, is a pure probe of possible new physics in t-decay independent of top production mechanism.

Conclusions

- Lepton angular distribution is a **pure** probe of possible new physics in **any** process of t-quark production, independent of possible new physics in t-decay.
- Lepton energy distribution, in the t-rest-frame, is a pure probe of possible new physics in t-decay independent of top production mechanism.
- Polarization of t-quark can be measured (quantitatively) through angular asymmetries of decay leptons.

Conclusions

- Lepton angular distribution is a **pure** probe of possible new physics in **any** process of t-quark production, independent of possible new physics in t-decay.
- Lepton energy distribution, in the t-rest-frame, is a pure probe of possible new physics in t-decay independent of top production mechanism.
- Polarization of t-quark can be measured (quantitatively) through angular asymmetries of decay leptons.
- Angular distribution of decay lepton in the lab-frame is a good qualitative probe of t-polarization; quantitatively better for negative polarizations.
