

To detect the counterparts  
with GWAC system

Liping Xin (NAOC)

on behalf of the GWAC team and GRANDMA team

# Outlines

1. GWAC system and observations
2. Blind search for optical transients
3. galaxy targeting search

# GWAC and its follow-up system

Search with  
small FoV telescopes (60cm)

Search with  
Large FoV instruments (GWAC)

1. To detect the counterparts by GWAC system
2. To follow up the candidates found by external groups

Typical image for GWAC

~10+5s (exposure+readout)

Zoomed image

12.4 \* 12.4 deg

Monitor the sky with high cadence (15s)

Make the follow-up with 60cm for GWAC OT candidates automatically

Human vetting

# The hosts of SGRB and KN

GW170817 / GRB 170817

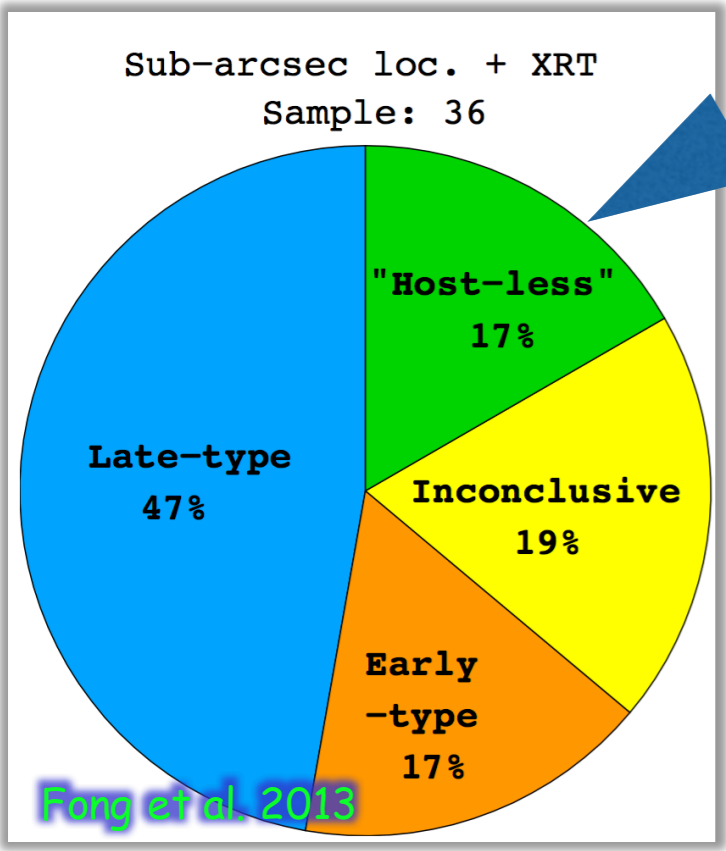

Adapted from Tanvir' talk

**It is efficient to search the KN by galaxy targeting, but some kilonovae would be missed since some SGRBs are host-less**

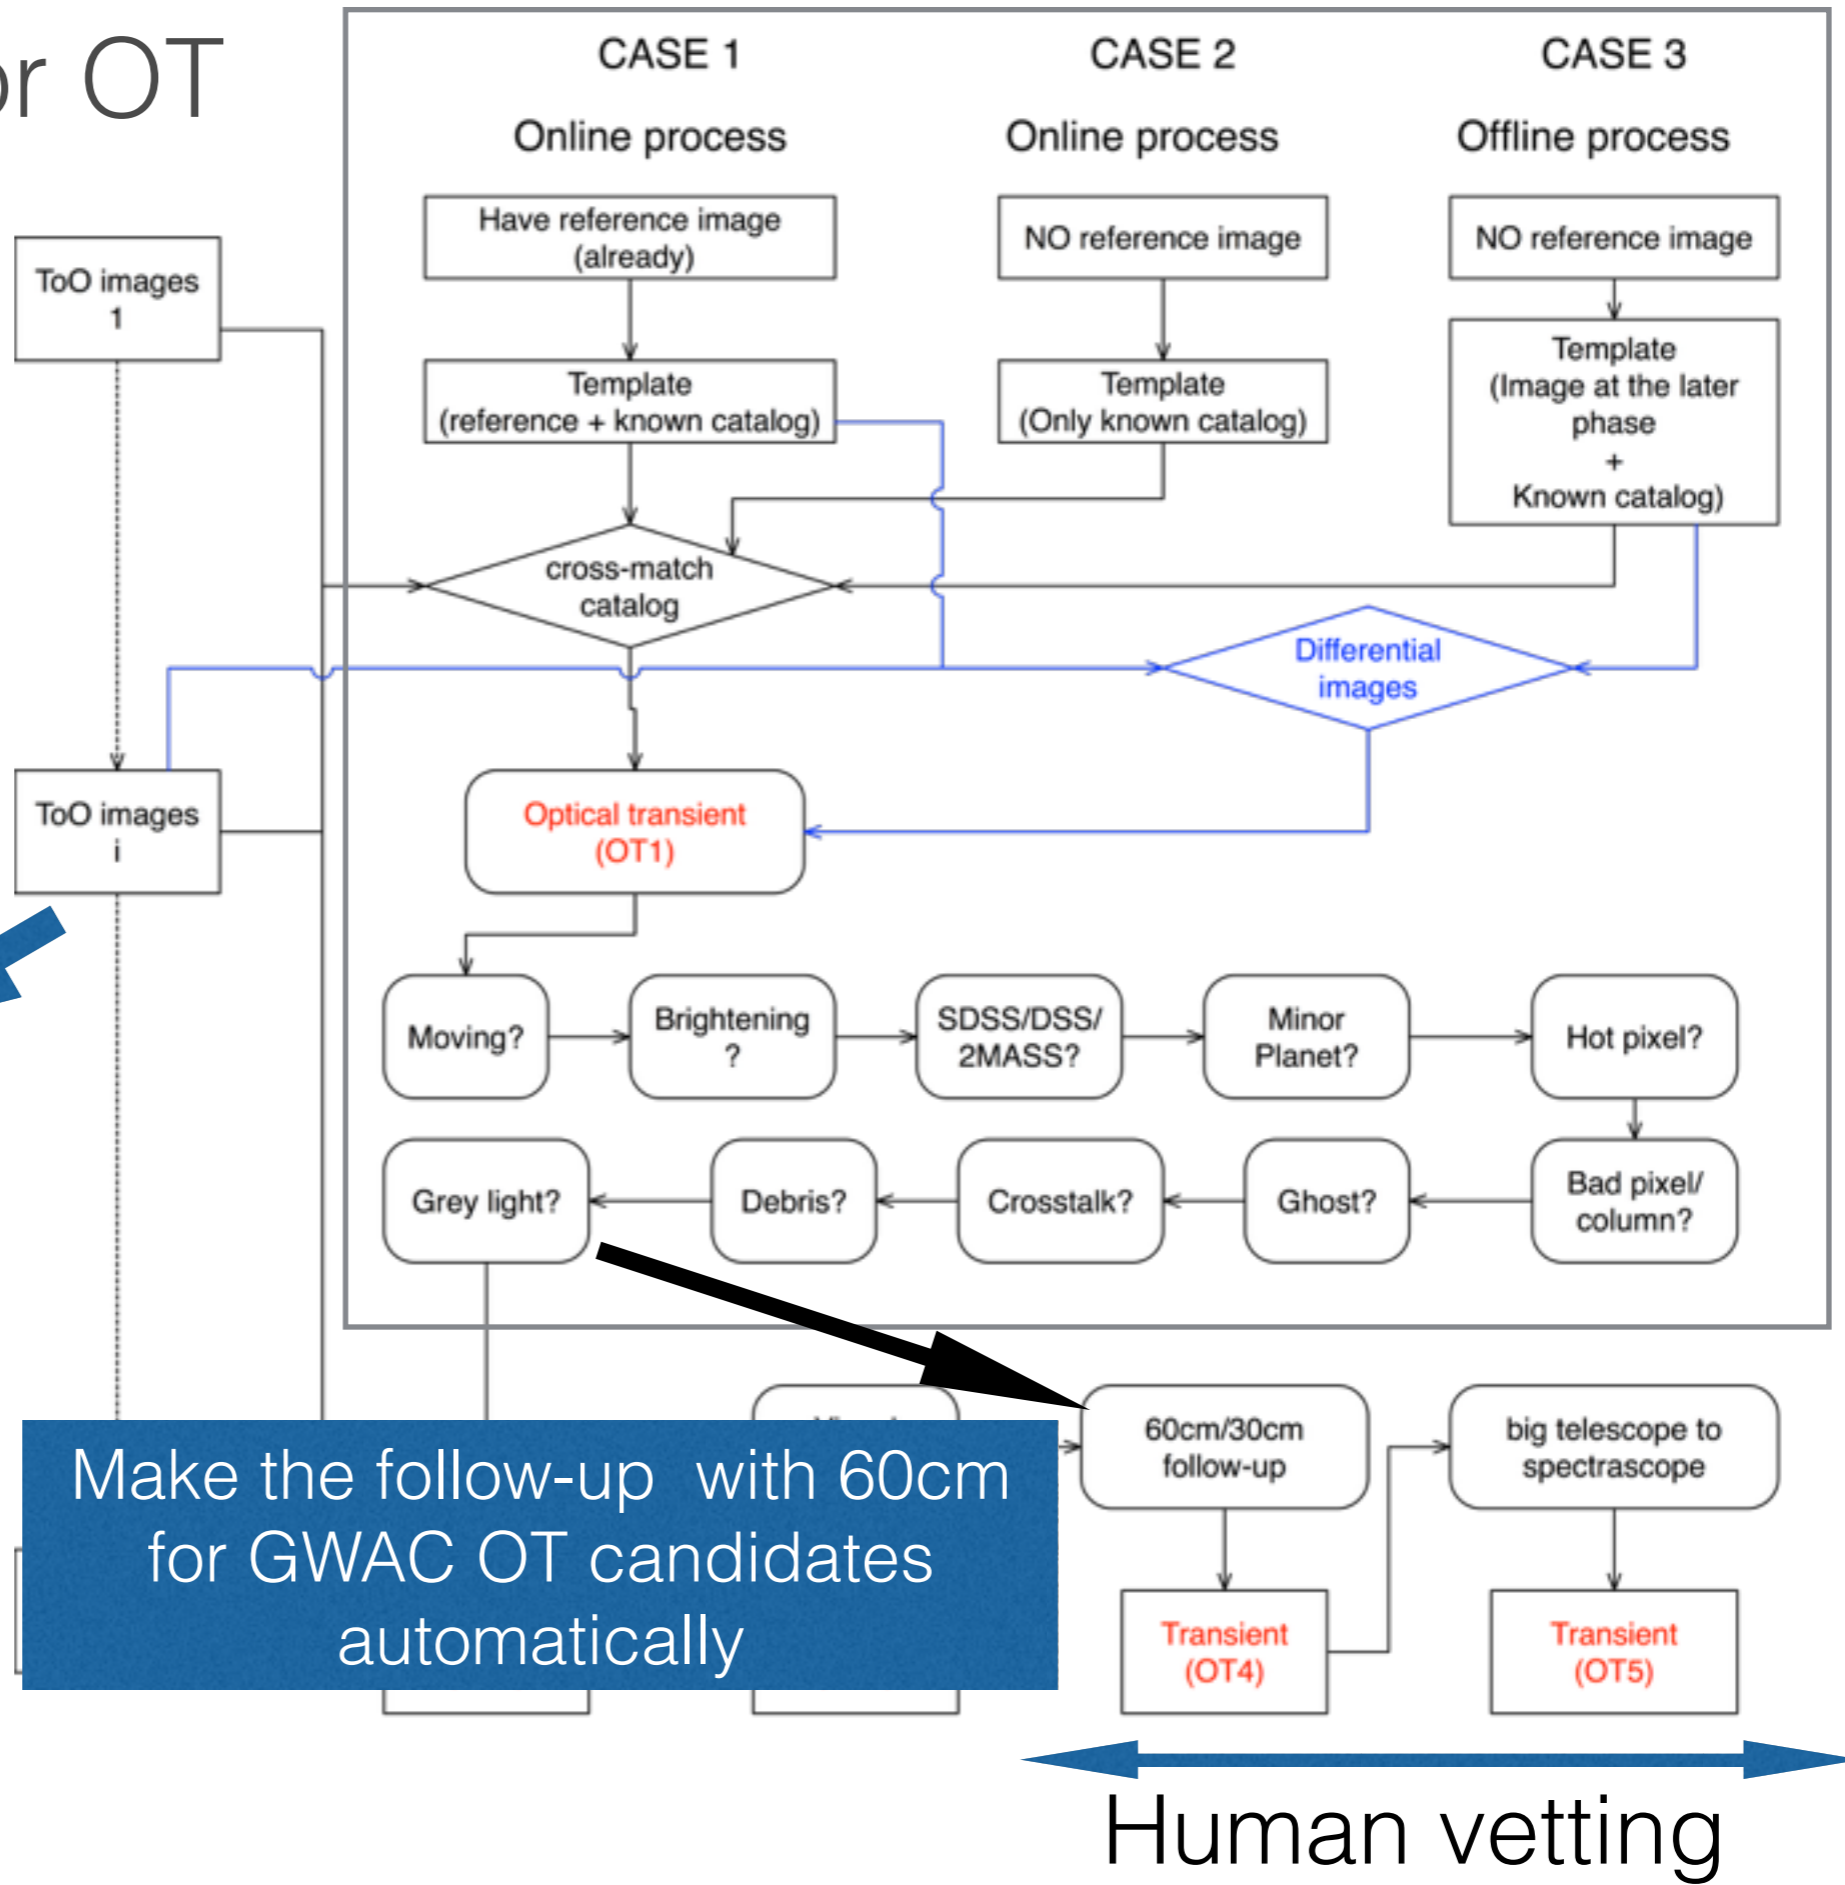

# Blind search for OT

Make the follow-up with 60cm for GWAC OT candidates automatically

Human vetting

To search for the kilonovae by  
galaxy targeting in GWAC images

# Galaxies in GWAC image

The sub sample of GLADE catalog

DEC>0 && dis<50Mpc

Test a GWAC image observed at 16th Apr. 2018

There are **98** galaxies.

There are **~1600** galaxies covered for a single exposure  
if four GWAC units are operated

SAOImage ds9

One example of the differential galaxy  
in the sub images of GWAC

M51(NGC5194)

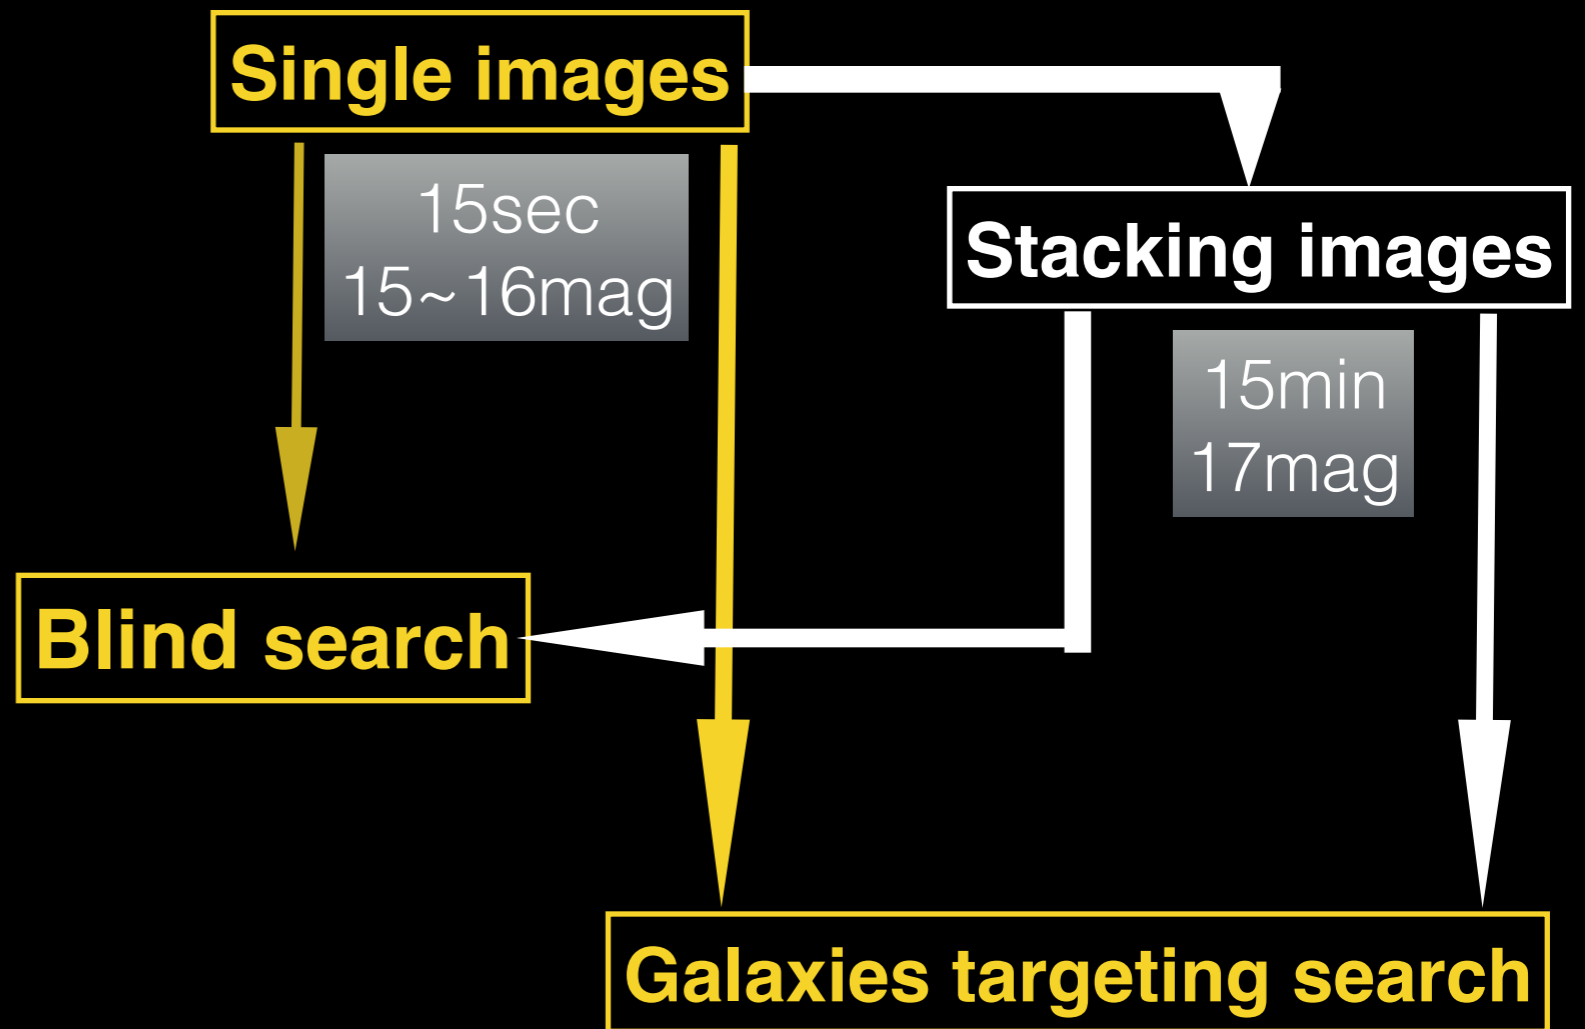

Data are observed at Mar. 18th, 2018

# Summary

For O3:

- FoV:  $\sim 2500 \text{ sq}^2$
- $\sim 1600$  galaxies could be monitored simultaneously

## • For GWAC:

### • Online/offline data processing:

- **Blind search** in the whole images by catalogue crossmatch
- **Sub-image subtraction** around the galaxies in the GWAC images

### • Cadence:

- Search for **short**-duration counterparts — single images one by one (15 sec cadence)
- Search for **long**-duration counterparts — stacking images (60 images, 15 min cadence)
