

The massive Landau-de-Witt gauge at finite temperature and density (45+15)

Thursday, November 9, 2017 3:00 PM (1 hour)

We review recent results of the massive Landau-de-Witt gauge approach to the description of Yang-Mills and QCD theories at finite temperature and/or densities. In particular we consider the formal but interesting limit of heavy quarks and compare with other approaches, including the lattice as a benchmark. We also discuss some of the limitations of the method and draw some parallels with other approaches.

Presenter: REINOSA, Urko (Ecole Polytechnique Palaiseau)
