

# *A primer to Long-Lived Particle phenomenology*

Eric Conte (GRPHE-IPHC)

IRN Terascale

13-15 December 2017 @ Marseille (France)

## What is a LLP (Long-Lived particle) for ATLAS and CMS?

## Why LLP?

Currently no hint of New Physics at LHC!

- Explore ways that new physics could have escaped the attention of all these searches.
- As most searches assume promptly decaying new particles, LLP can be a good way.

## LLP Community Workshop

2 workshop in 2017 (CERN and Trieste) gathering CMS, ATLAS and LHCb  
Goal: recommendations and guide lines for experiments (white paper)

- 1. LLP in BSM models**
- 2. Experimental signatures**
- 3. Experimental selections**
- 4. Reinterpretation issues**

- 1. LLP in BSM models**
- 2. Experimental signatures**
- 3. Experimental selections**
- 4. Reinterpretation issues**

## (Displaced) supersymmetry

- **RPV-Supersymmetry:**

R-parity conservation is added for conserving L and B numbers.

→ R-parity violation : adding terms to superpotential

$$W_{\Delta B \neq 0} = \frac{1}{2} \lambda''_{\{ijk\}} U_i D_j D_k \text{ and } W_{\Delta L \neq 0} = \frac{1}{2} \lambda_{ijk} L_i L_j E_k + \lambda'_{ijk} L_i Q_j D_k + \epsilon_i L_i H_u$$

Phenomenological consequences: **the LSP is not stable**

Several possible kinds of LLP according to the the nature of LSP (neutralino, stop, ...)

## (Displaced) supersymmetry

- **AMSB (Anomaly Mediated Supersymmetry Breaking):**

Some scenarios where the NSLP and LSP are very close in mass.

Ex: LSP =  $\widetilde{\chi}_1^0$  and NLSP =  $\widetilde{\chi}_1^+$  and with  $\Delta M \sim 160$  MeV

Only possible decay:  $\widetilde{\chi}_1^+ \rightarrow \widetilde{\chi}_1^0 + \pi^+$

→ NLSP = LLP

- **GMSB (Gauge Mediated Supersymmetry Breaking):**

- LSP = gravitino
- Decays to gravitino suppressed by SUSY-breaking scale

## (Displaced) supersymmetry

- **Split Supersymmetry:**

- All scalars but the SM higgs have a heavy mass.
- Gluino, neutralinos and charginos have a low mass.

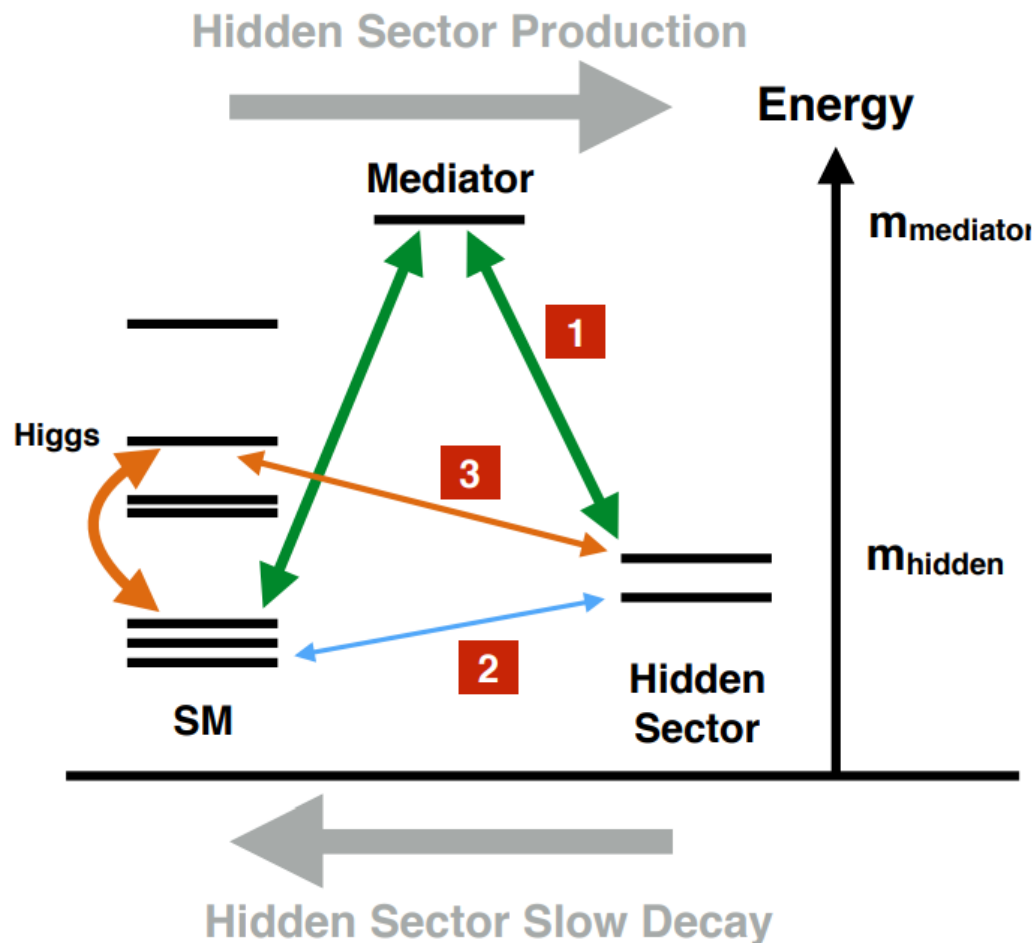

Phenomenological consequences:

- Gluinos are long-lived because they decay by heavy virtual squarks
- Possible decays:  $\tilde{g} \rightarrow \tilde{\chi}_1^0 q \bar{q}$ ,  $\tilde{g} \rightarrow \tilde{\chi}_1^\pm q \bar{q}'$ ,  $\tilde{g} \rightarrow \tilde{\chi}_1^0 g$   
→ R-hadron

## Hidden sectors

arXiv:1702.02524 [hep-ph]s

- New physics could lie at  $M_{\text{hidden}} < \text{TeV}$  hidden by small coupling to SM  
→ **hidden sector**
- Hidden sectors can be connected to the SM via small effective couplings  
→ **portals:**
  - By the production and decay of a heavy non-SM mediator
  - By small direct coupling
  - By exotic decay of the Higgs boson
- Portals = LLP

## Hidden sectors

Several possible portal. Some examples:

- **Higgs portal**

the Higgs boson can decay into a pair of new scalar bosons

- **Neutrino portal**

Heavy, right-handed neutrino  
Long lifetime due to off-shell decay

1. LLP in BSM models
2. Experimental signatures
3. Experimental selections
4. Reinterpretation issues

# 2. Experimental signatures

Search strategy is strongly-dependent on the proper lifetime and the boost of the LLP

for  $c\tau = 5$  cm,  $\langle\beta\gamma\rangle \sim 30$

for  $c\tau = 50$  cm,  $\langle\beta\gamma\rangle \sim 30$

[Figures from Heather Russell]

Need to have probe LLP with different signatures and subdetectors

# 2. Experimental signatures

CMS/ATLAS-like  
detector

[Figure from Karri  
Folan DiPetrillo]

# 2. Experimental signatures

## Displaced signatures

Displaced leptons

LLP decays into leptons  
(Ex:  $\widetilde{\chi}_1^0$  or  $\tilde{t}$  in RPV-Susy)

Identification: large  $|d_0|$

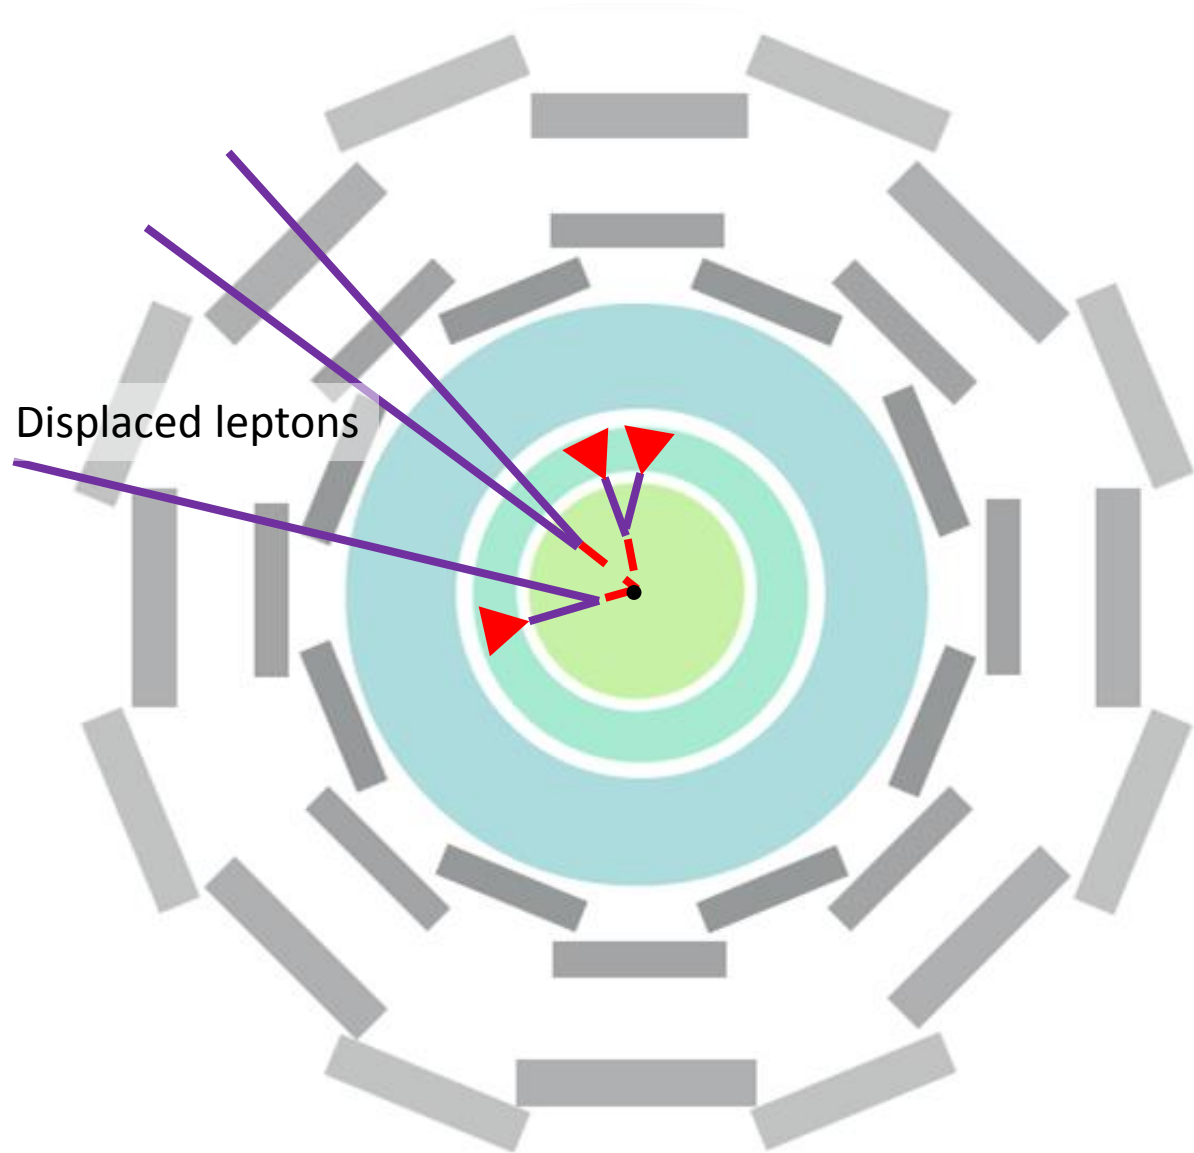

[CMS: PRD91, 052012]

[CMS-PAS-EXO-16-022]

[CMS-PAS-HIG-16-035]

[ATLAS-CONF-2017-026]

[ATLAS-CONF-2016-042]

# 2. Experimental signatures

## Displaced signatures

Displaced muons  
with the muon chambers

Only the muon  
chambers are used

[CMS-PAS-EXO-14-012]  
[ATLAS: PRD92(2015) 012010]

# 2. Experimental signatures

## Displaced signatures

Displaced multi-track vertices

Identification:  
reconstructing vertex from  
the displaced tracks

[ATLAS: [arXiv:1710.04901](https://arxiv.org/abs/1710.04901)]  
[ATLAS: PRD92(2015) 072004]

# 2. Experimental signatures

## Displaced signatures

Displaced photons

$$\text{Ex: } \tilde{\chi}_1^0 \rightarrow \tilde{G} + \gamma \quad (\text{GMSB})$$

### Identification:

- photon might not point back to the primary vertex
- photon might arrive late compared to a prompt photon

[CMS-PAS-EXO-16-003]

[CMS-PAS-EXO-12-035]

[ATLAS: PRD90(2014) 112005]

# 2. Experimental signatures

## Displaced signatures

Displaced jets

Ex: exotic decay of the Higgs boson  $H \rightarrow 2s \rightarrow 4f$

Identification:

- Trackless jet
- Low ECAL/HCAL energy fraction

[CMS-EXO-16-003]

[ATLAS- CONF-2016-013]

[ATLAS: PRD92(2015) 012010]

# 2. Experimental signatures

## Other signatures

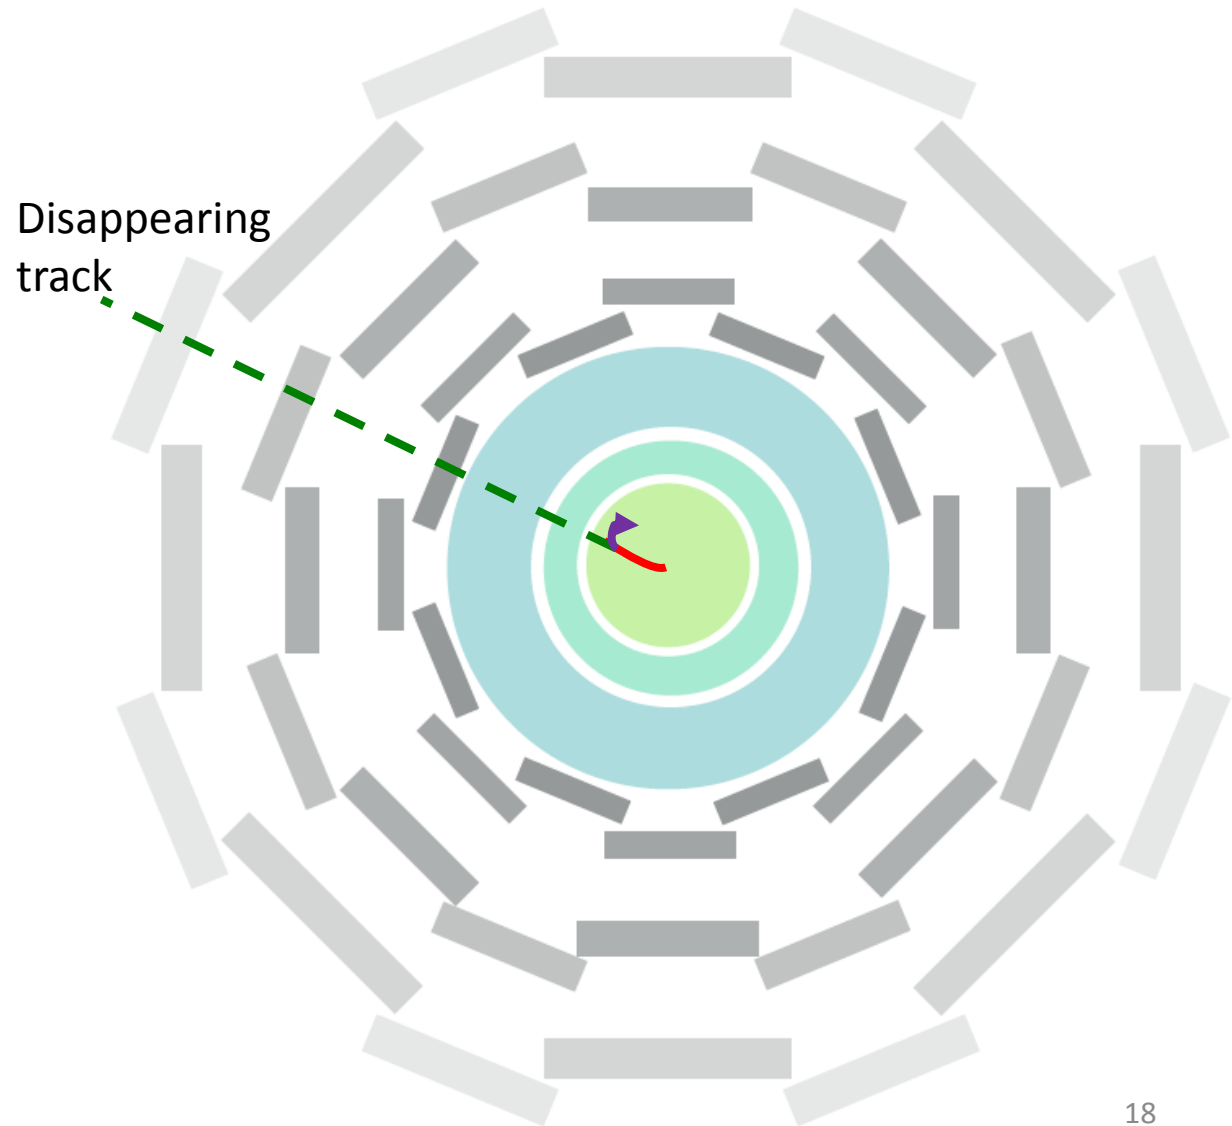

### Disappearing track

LLP decays into undetectable particle (low momentum track)

Ex:  $\chi_1^+ \rightarrow \chi_1^0 + \pi^+$  (AMSB)

Identification : missing outer hits in the track

[CMS-EXO-12-034]  
[ATLAS-CONF-2017-017]

# 2. Experimental signatures

## Other signatures

Kinked tracks

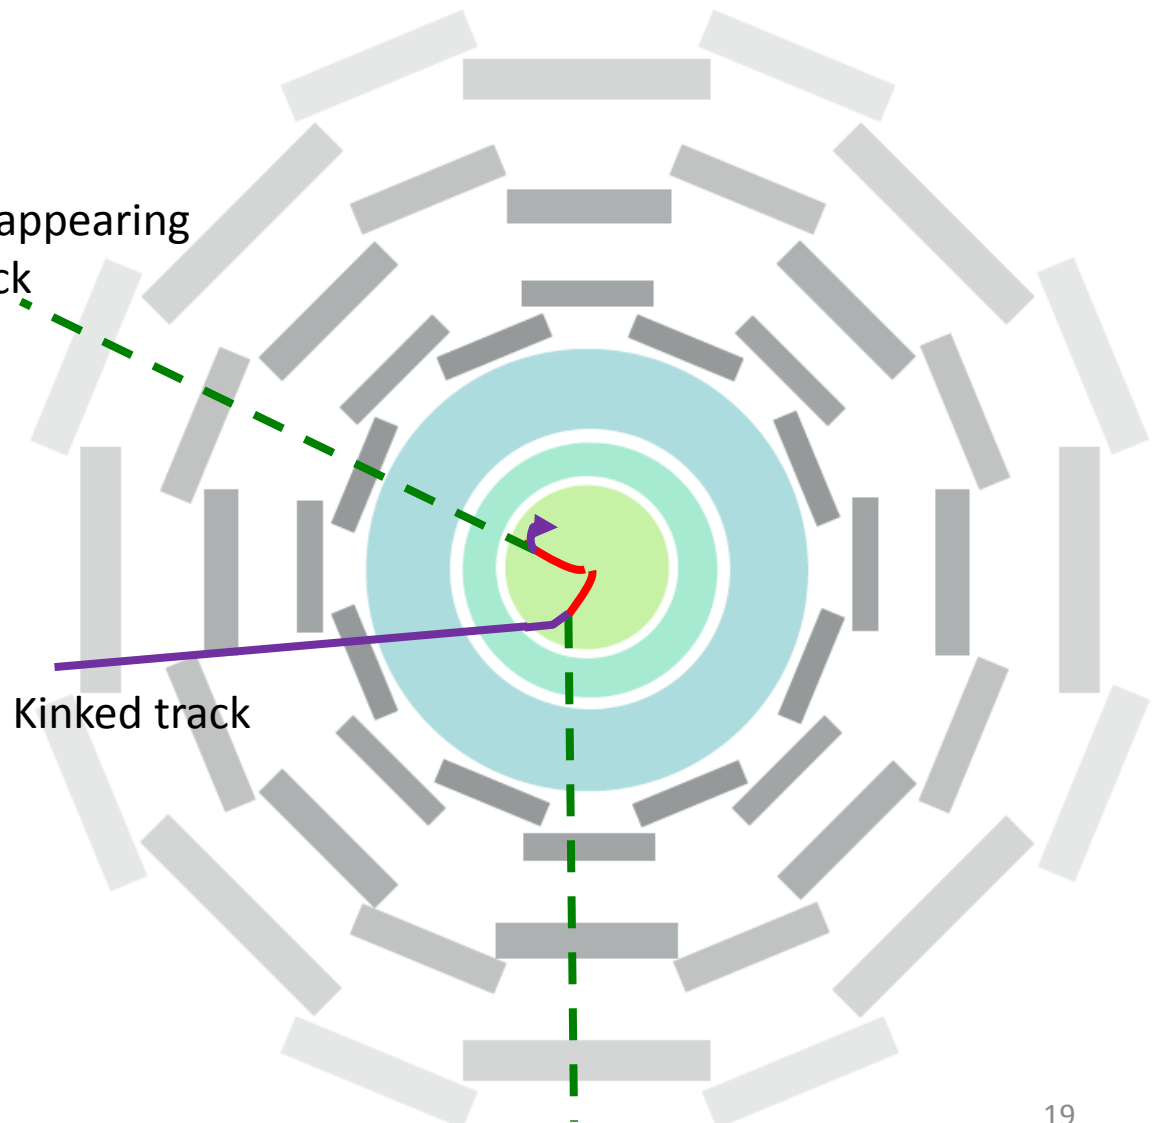

Similar to the disappearing tracks

Charged LLP + charged product  
≡ track that abruptly changes direction

No public results

Disappearing track

Kinked track

# 2. Experimental signatures

## Other signatures

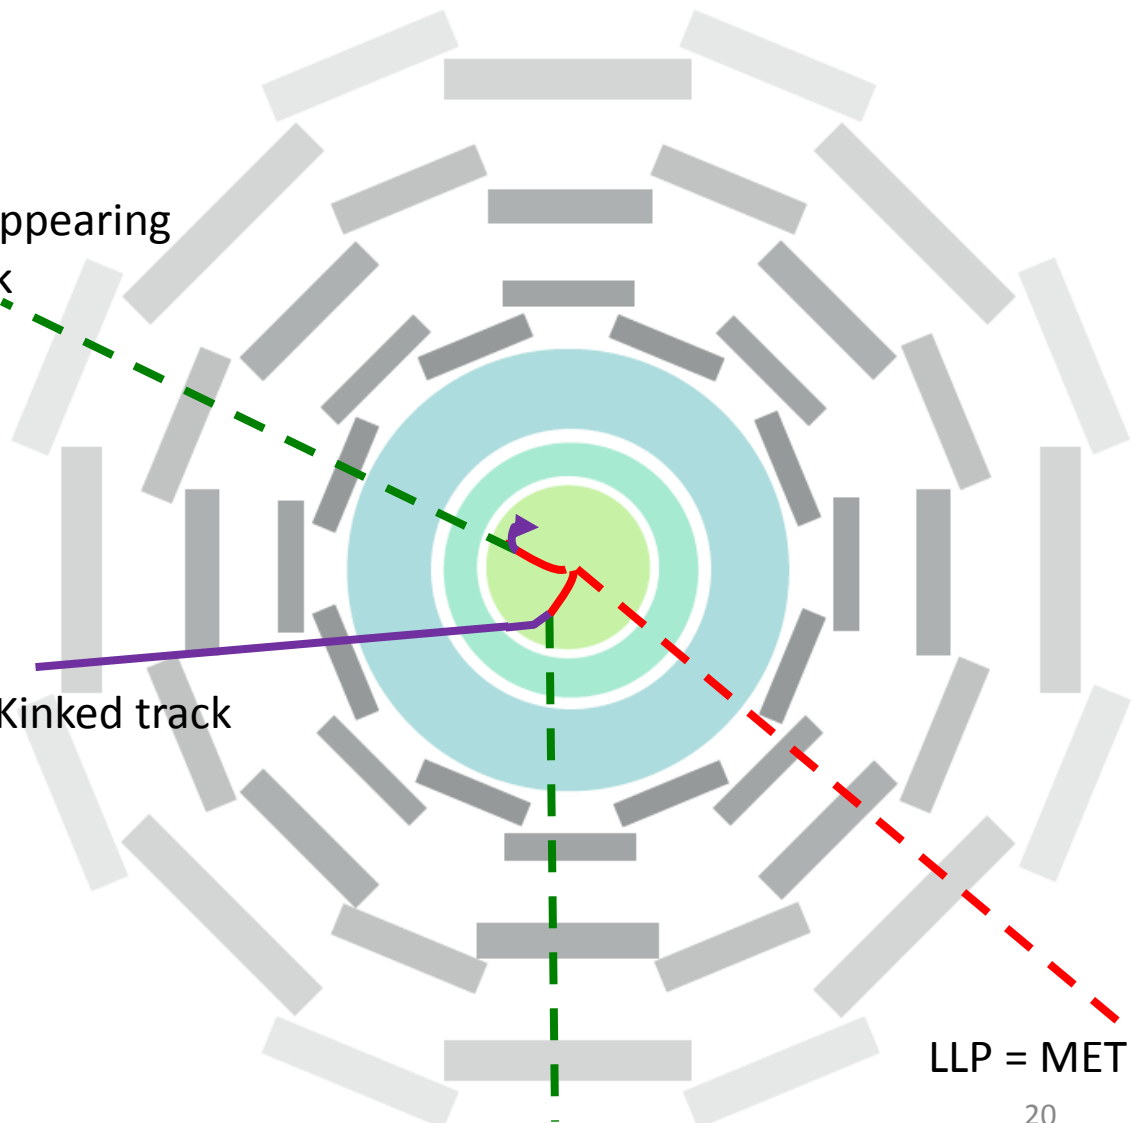

Heavy Stable Neutral Particle

Sensible to MET signature

Disappearing track

Kinked track

LLP = MET

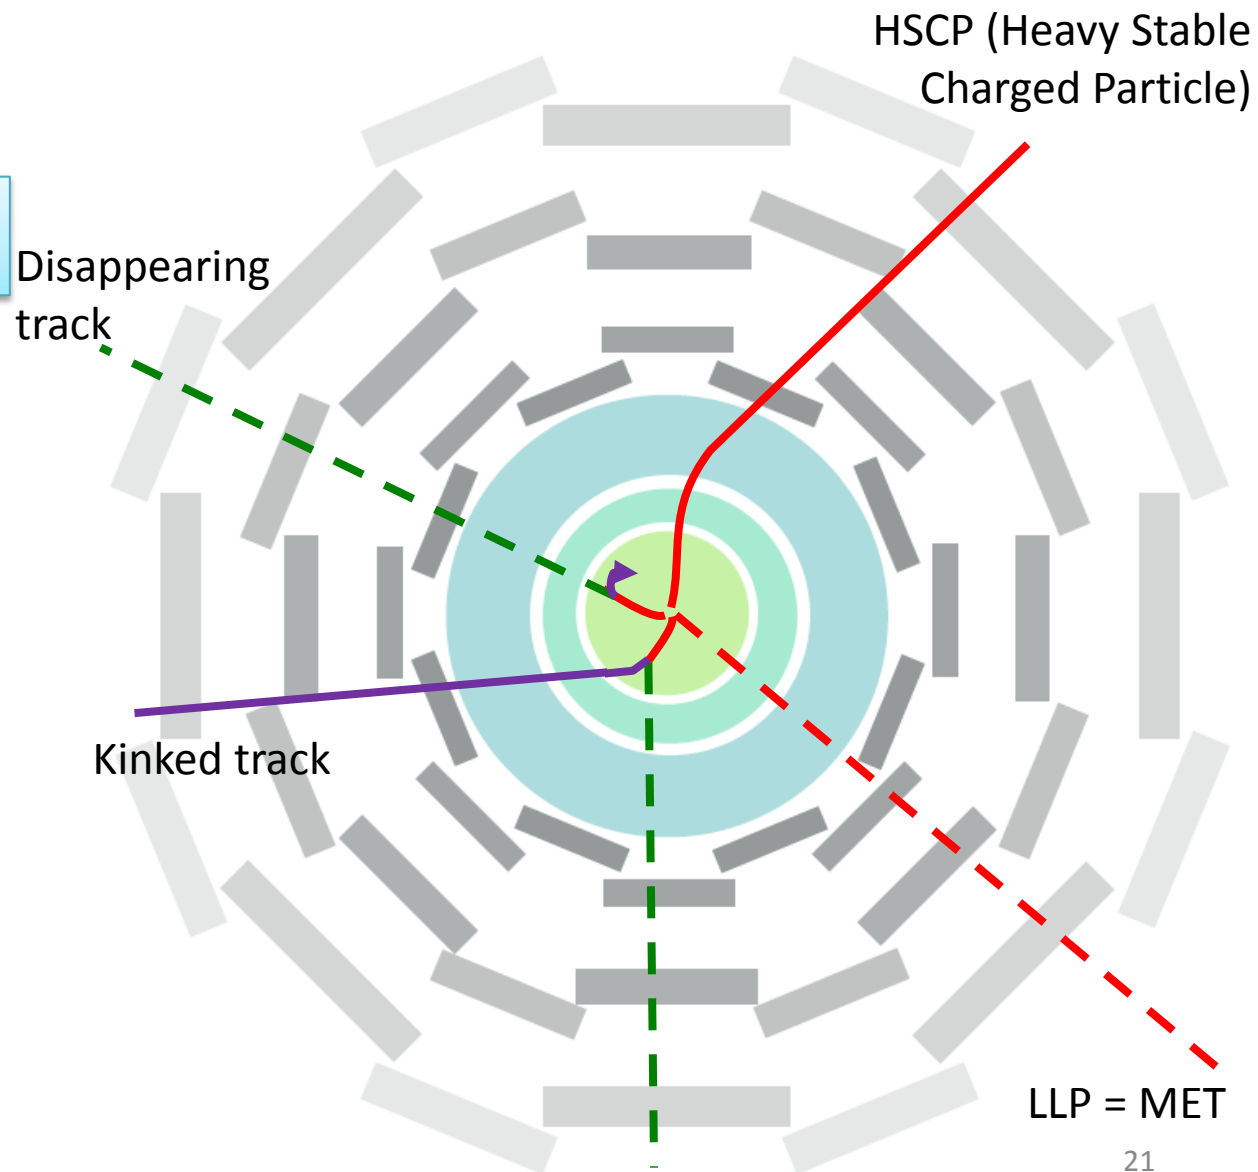

# 2. Experimental signatures

## Other signatures

### Heavy Stable Charged Particle

#### Identification:

- Higher rate of energy loss via ionization ( $dE/dx$ ) in the tracker volume
- Longer time of flight (tracker + muon chamber)

# 2. Experimental signatures

## Other signatures

### Heavy Stable Charged Particle

#### Identification:

- Higher rate of energy loss via ionization ( $dE/dx$ ) in the tracker volume
- Longer time of flight (tracker + muon chamber)

[CMS-EXO-15-010]

[CMS-EXO-16-036]

[ATLAS: PRD93 (2016) 112015]

[ATLAS: PRD760 (2016) 647-665]

[ATLAS: JHEP01 (2015) 068]

# 2. Experimental signatures

## Stopped LLP

Several seconds,  
minutes, hours  
or months later

- Stopped LLP  $\rightarrow$  jets  
[CMS-PAS-EXO-16-004]  
[ATLAS PRD88(2013) 112003]
- Stopped LLP  $\rightarrow$  muons  
[CMS PAS-EXO-17-004]

Case of **LL gluino**  $\Rightarrow$  **R-hadrons** in split supersymmetry

- R-hadron interaction with calorimeter matter :  
gluino non-interacting spectator, surrounding by a  
cloud of interacting quarks.
- Then gluino decays into  $\tilde{\chi}^0 + \text{jets}$

**Identification:** a high-energy  
jet that is not coincident with  
the proton-proton collisions

1. LLP in BSM models
2. Experimental signatures
3. Experimental selections
4. Reinterpretation issues

# 3. Experimental side

## Exotic signature → challenging analyses

### Trigger challenge

- Possibility to use standard triggers but we need to be cunning: displaced  $e \rightarrow \gamma$  trigger, displaced  $\mu \rightarrow$  muon-chamber-based trigger
- Some devoted trigger have been created: trackless jets, hip trigger, ...
- But creativity in trigger strategy is constrained by rate budget and current trigger design.

### Reconstruction challenge

- Standard algorithms are not designed for LLP
- Extending existing algorithms (ex: displaced tracks)
- Need manpower for development, validation, maintenance

### Background challenge

- Several sources of background difficult to handle:
- SM long-lived particles
  - Cosmics
  - Beam-induced background
  - Nuclear interaction, ...

# 3. Experimental side

## Example: CMS-EXO-16-022 – displaced $e\mu$ leptons

- **Models tested:** SUSY RPV with stop quarks decaying in e-mu
- **Trigger:** dedicated trigger to displaced e- $\mu$  (relaxing some constraints to PV, no track for e)
- **Reconstruction:** 8-TeV tracking performance (new algorithm available now for displaced)
- **Background:** non-QCD contribution, heavy-flavour QCD contribution

# 3. Experimental side

## Example: ATLAS-CONF-2016-103 – displaced jets

- **Models tested:** hidden sector benchmark model
- **Trigger:** a dedicated trigger called *CalRatio-trigger* : trackless jet + properties of the jet
- **Reconstruction:** classical jet-clustering + BDT to select displaced jets
- **Background:** cosmics+beam induced backgrounds (a broad timing distribution), multijets processes (data-driven method estimation)

95% CL Upper Limit on  $\sigma \times \text{BR}$  [pb]

# 3. Experimental side

## How to present all the LLP analysis results?

- Difficult to have a clear overview
- One attempt with some results

CMS long-lived particle searches, lifetime exclusions at 95% CL

1. LLP in BSM models
2. Experimental signatures
3. Experimental selections
4. Reinterpretation issues

# 4. Reinterpretation

## Why reinterpretation?

### Difficulty to be exhaustive in interpretation:

- covering all the parameter space of a given model
- testing all the existing models
- testing all the new models which could be conceived after the analysis

We must be able to launch an existing analysis, **tomorrow or in few years**, with a **different signal** benchmark and to compute a limit.

### Solution 1

Use the **RECAST project** (*under development*) which :

- Captures the analysis code, the data, ...
  - Allows people to upload they own MC signal samples
  - Launch automatically the codes and store results
- Highly supported by the LLP community workshop

### Solution 2

- Experimentalists provide all useful information to phenomenologists.
  - Developing an external code which mimics the analysis results.
- Approximations but much faster (useful for scan over parameter-space)
- Identification of topologies or region not tested by experimentalists
- Feedback to experimentalists

# 4. Reinterpretation

## Solution 2

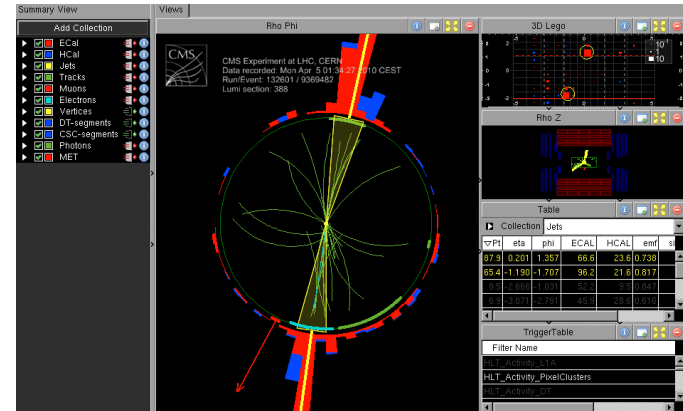

### Based on Simplified Models

- Work with event topology
- Properties are reduced to mass spectrum, xsection and BR

**Extremely fast**  
**Moderately accurate / general**

### Based on Detector simulation

- Mimicking simulation + reconstruction + selection achieved by CMS or ATLAS
- « Very-fast » simulation

**Very-Fast**  
**Accurate / general**

# 4. Reinterpretation

## Simplified Models for Long-Lived Particles

Plethora of topologies and the number of simplified models must be reduced.

- **Choose a few simplified models** that highlight the limitations of the search and clearly illustrate where sensitivity is lost (low LLP mass, high LLP boost, ...)
- **Factorization** the production mode and the decay mode

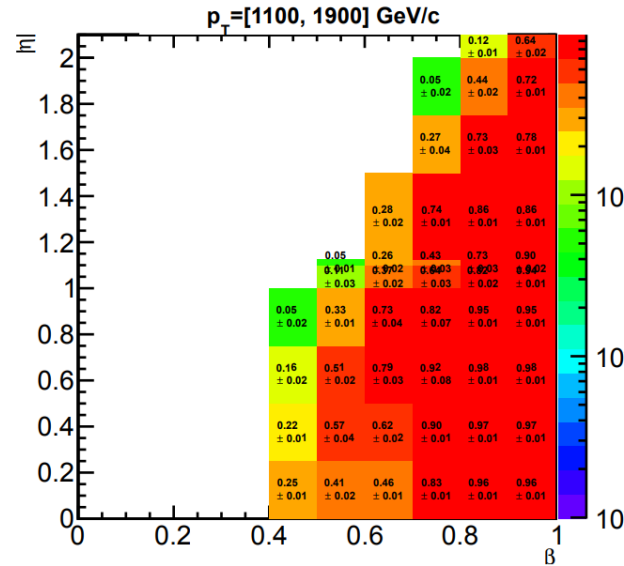

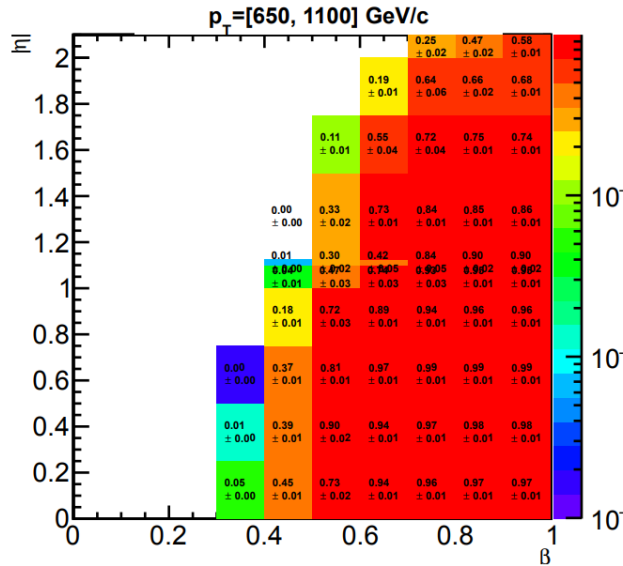

**Need to create a common database (one goal of the LLP workshop)**

# 4. Reinterpretation

## Simplified Models for Long-Lived Particles

- **Efficiency maps** are required for recasting with Simplified Models.  
Which kind of information do we need? a compromise must be found to get a reasonable number of parameters

A good example:  
**EXO-13-006 (HSCP analysis)**  
→ Numerous efficiency maps

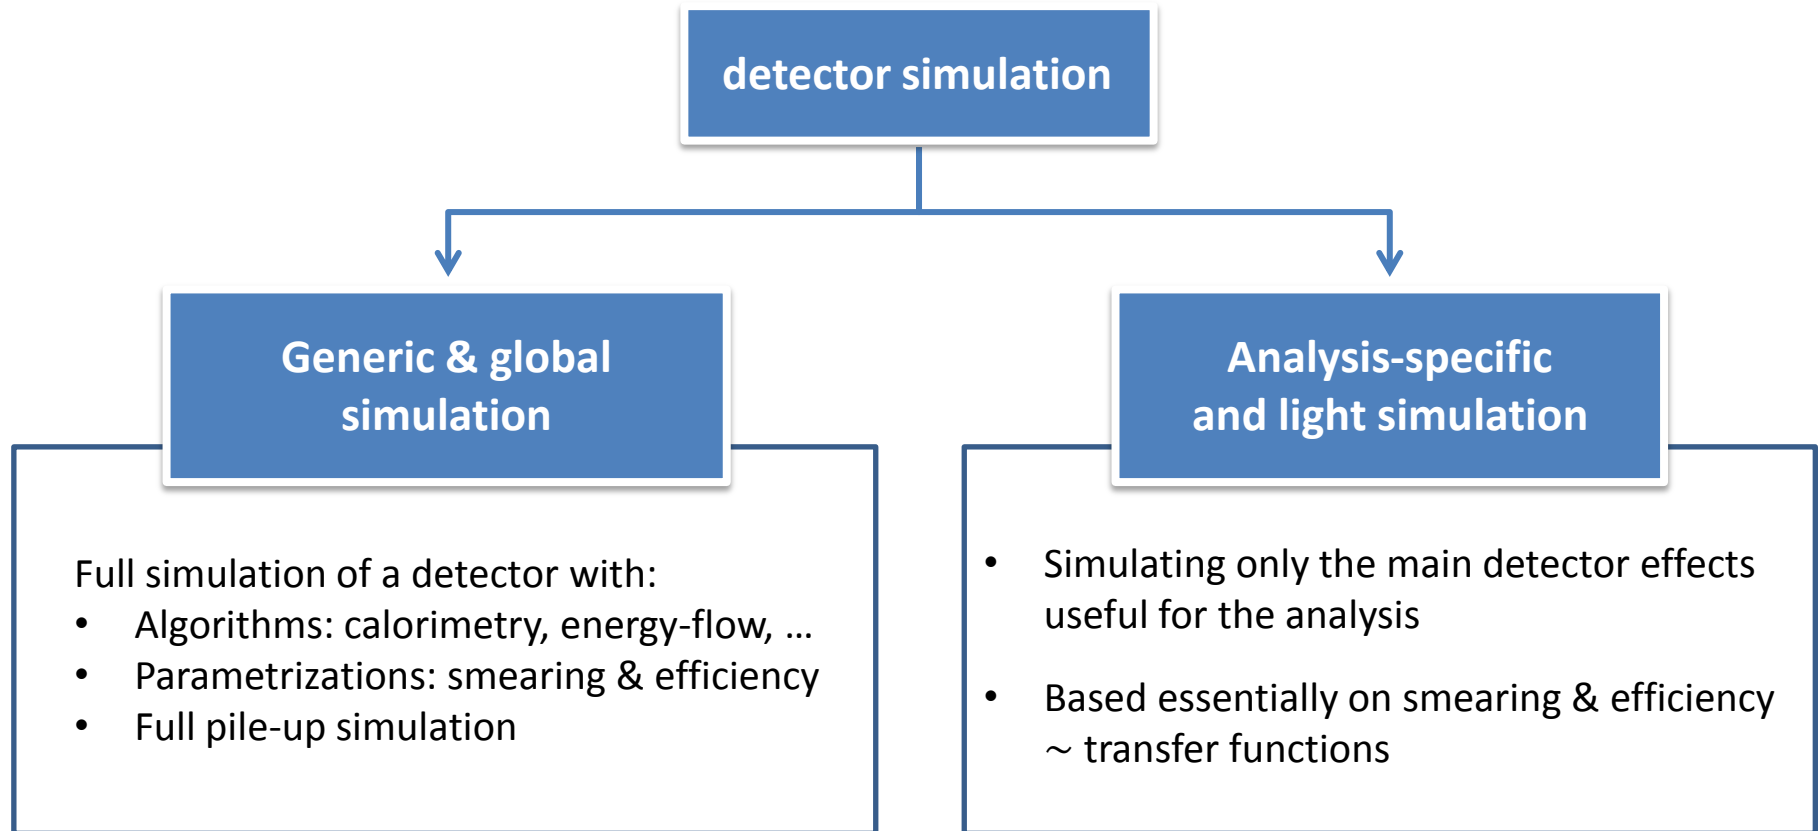

Example: probability of a single long-lived particles passed the online selection as a function of true particle  $p_T$ ,  $\beta$  and  $|\eta|$

- Reinterpretation tools based on simplified models must be extended.

# 4. Reinterpretation

## Recasting based on detector simulation

CheckMate

MadAnalysis 5

- BuckFast from **Gambit**
- Detector effects in **Rivet** and **ATOM**

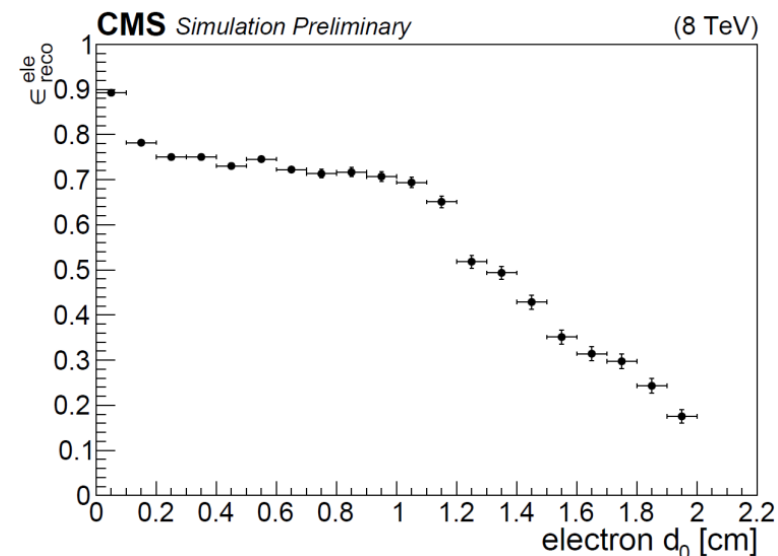

# 4. Reinterpretation

## Recasting based on detector simulation: the pure parametric way

### Example of CMS-EXO-16-022: displaced leptons e- $\mu$

Efficiencies and resolution functions are available (plots & data table).

Cut Summary of CMS displaced $e\mu$
<b>Preselection</b>
1 OS $e^\pm\mu^\mp$ pair
$d_\ell > 100 \mu\text{m}$
$p_{T,\ell} > 25 \text{ GeV}$ , $ \eta_\ell  < 2.5$
Reject $1.44 <  \eta_e  < 1.56$
$I_{\Delta R < 0.3}^{calo,e} < 0.10$ , $I_{\Delta R < 0.4}^{calo,\mu} < 0.12$
$\Delta R_{\ell j} > 0.5 \forall$ jets with $p_T > 10 \text{ GeV}$
$\Delta R_{e\mu} > 0.5$
$v_{T,\bar{\ell}} < 4 \text{ cm}$ , $v_{Z,\bar{\ell}} < 30 \text{ cm}$
Veto additional leptons

# 4. Reinterpretation

## Recasting based on detector simulation : the Delphes way

The official Delphes package does not suit Long-lived particle analysis.  
But by its modular architecture, people can develop new devoted modules.

### Example:

MA5 tune of Delphes devoted to displaced leptons for recasting : CMS-EXO-16-022

→ Usual simulation + CMS efficiencies

See my talk of yesterday for more details about this implementation

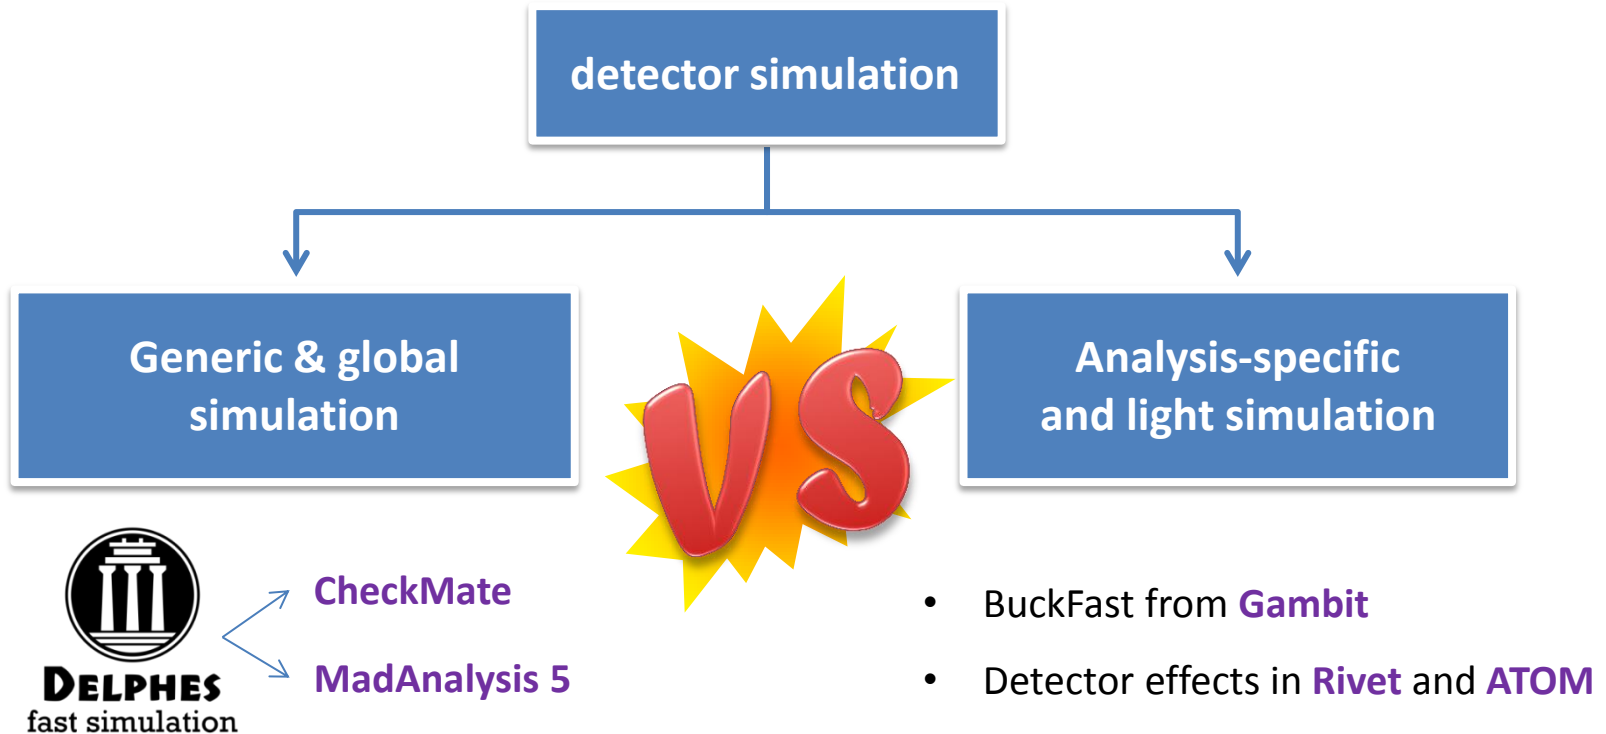

Besides, **some algorithms can be developed in the future:**

- Vertexing algorithms for secondary vertex
- Displaced jets based on realistic calorimetry

**Limitation of these tools:** no trigger, no fake and no instrumental background

# 4. Reinterpretation

## Recasting based on detector simulation

### Debate: Delphes vs specific parametrization?

- Analysis-signature dependent issue.
- Kinematical region dependent issue.

→ Performance of the two techniques should be compared on some analysis examples.

## LLP in many BSM models:

- Supersymmetry: RPV, AMSB, GMSB, split susy, ...
- Hidden sectors: Higgs portals, neutrino portals, ...

## Experimental signatures are numerous and exotic:

→ ATLAS and CMS program in LLP is rich and can be improved more

## LLP analysis are challenging for :

- Trigger strategy?
- Non-standard reconstruction algorithm
- Background estimation

## Reinterpretation: work in progress

- By simplified models: need to provide a collection of simplified models
- By detector simulation: parametric way or Delphes

Some recast attempts are available.

Interesting topics not covered:

- LHCb
- MATHUSLA
- HL-LHC
