

Neutrino GDR meeting
Paris, France
Nov 20-21, 2017

Scientific potential of a neutrino beam from Protvino to ORCA (P2O)

*J. Brunner & **D. Zaborov** (CPPM - Marseille)*

In cooperation with

A. Sokolov, V. Garkusha & A. Zaitsev (IHEP – Protvino)

and the KM3NeT collaboration

- Unique opportunity for a very long baseline experiment (2600 km)
- Sensitivity to neutrino mass hierarchy and CP violation

The far detector : KM3NeT / ORCA

Depth=2475m

Digital Optical Module (DOM)

31
3-inch
PMTs
in
17-inch
glass
sphere

115 strings

18 DOMs / string

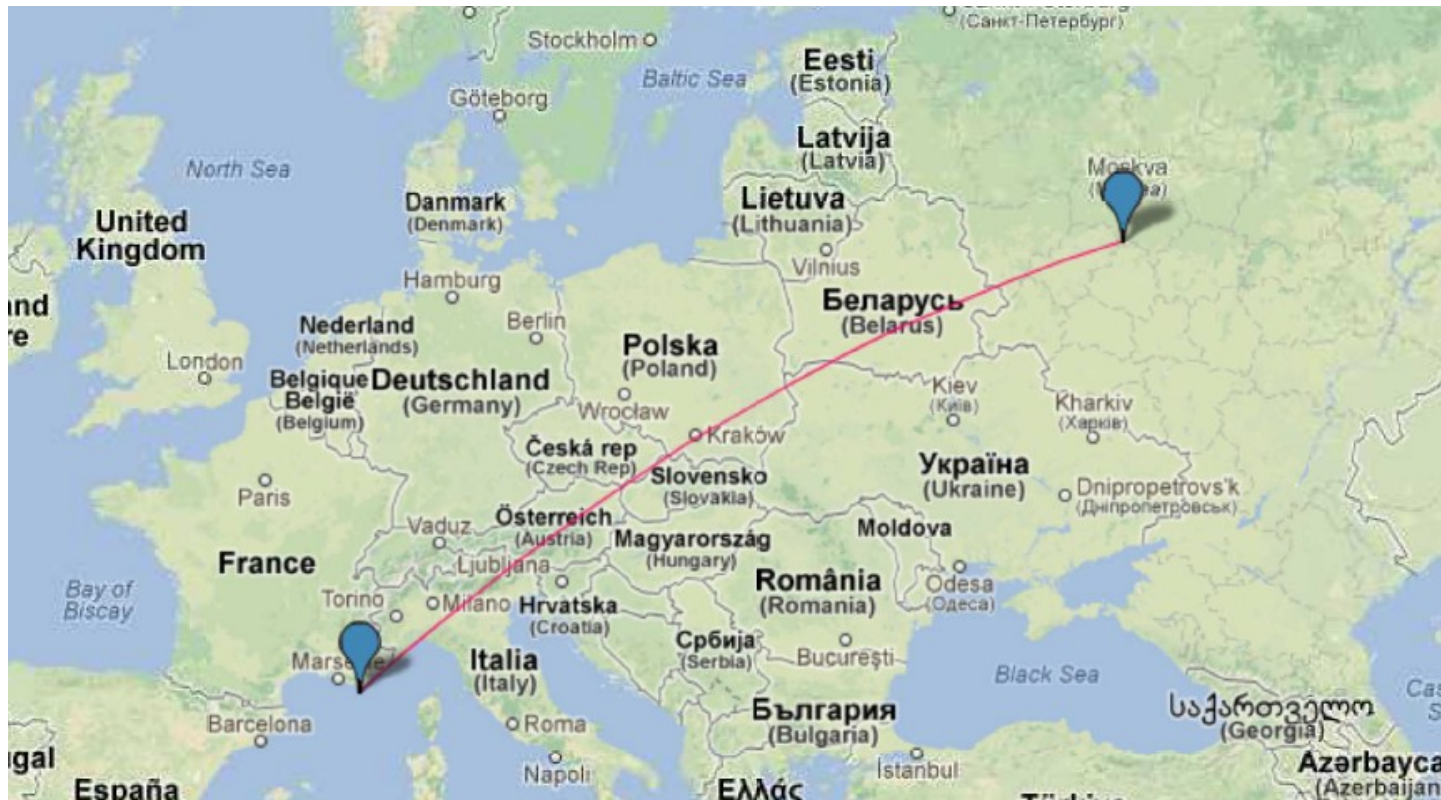

31 PMTs / DOM

Total: **64 000 PMTs (3")**

See talk by Liam Quinn

P2O : Protvino to ORCA

- Baseline 2588 km ; beam inclination : 11.7° ($\cos \theta = 0.2$)
- Deepest point 134 km : 3.3 g/cm^3
- First oscillation maximum 5.1 GeV
- Sensitivity to mass hierarchy and CP violation

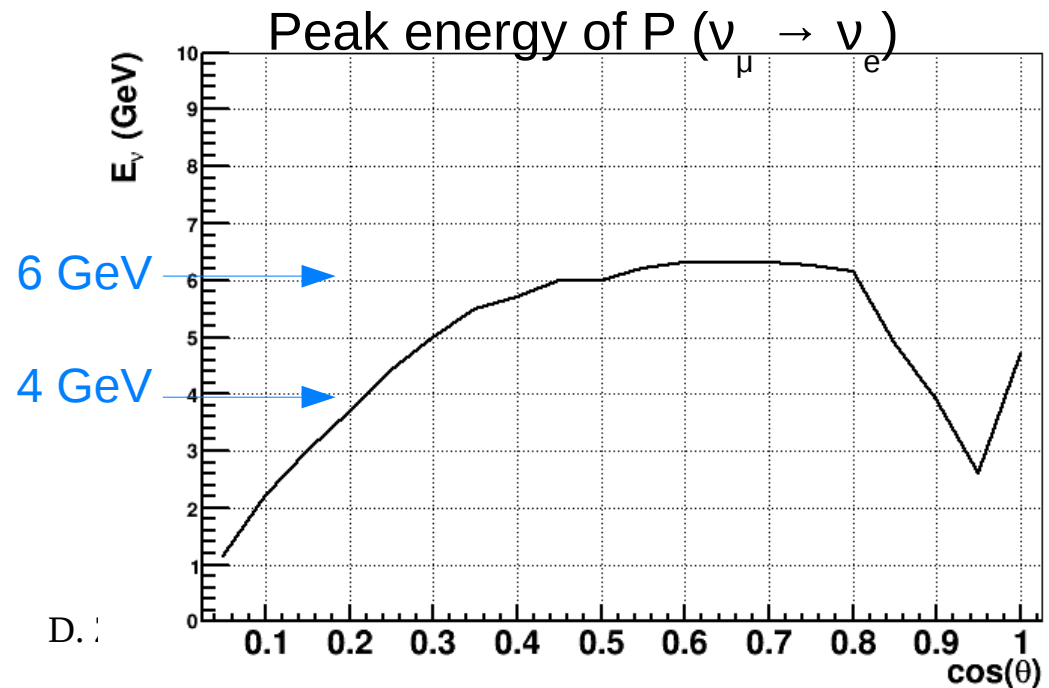

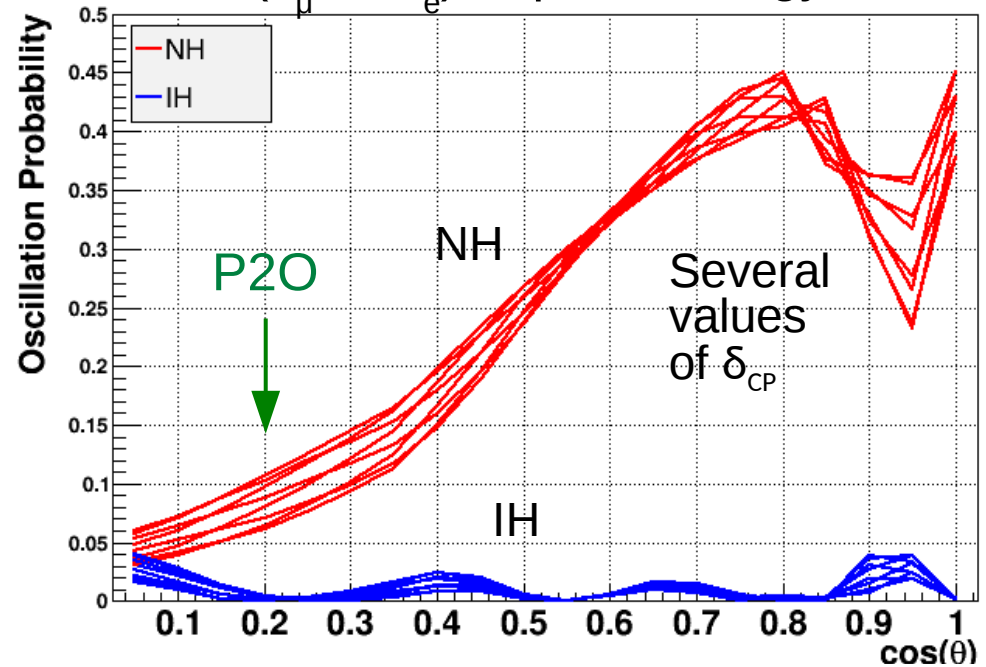

J. Brunner, arXiv:1304.6230; Adv. High En. Phys., 2013, Art. 782538,
<http://dx.doi.org/10.1155/2013/782538>,
D. Zaborov et al., Lomonosov conference, Moscow, August 2017

What baseline is best

$P(\nu_\mu \rightarrow \nu_e)$ at peak energy

- Optimal baseline to measure mass hierarchy with beam neutrinos is between 2000 km and 4000 km
- Degeneracy between MH and δ_{CP} for $L < 1000$ km
- Peak energy follows initially first oscillation maximum at $E = 25 \text{ GeV} * \cos\theta$
- levels off at mantle resonance energy ($\sim 6 \text{ GeV}$)

Protvino accelerator complex (100 km South of Moscow)

1-turn fast extraction:
5 μ s spill every 9 s

U-70 accelerator constructed in 1967
Now operates at 8 - 15 kW for \sim 60 days / yr

Operated by NRC «Kurchatov Institute» – Institute for High Energy Physics (IHEP), Protvino

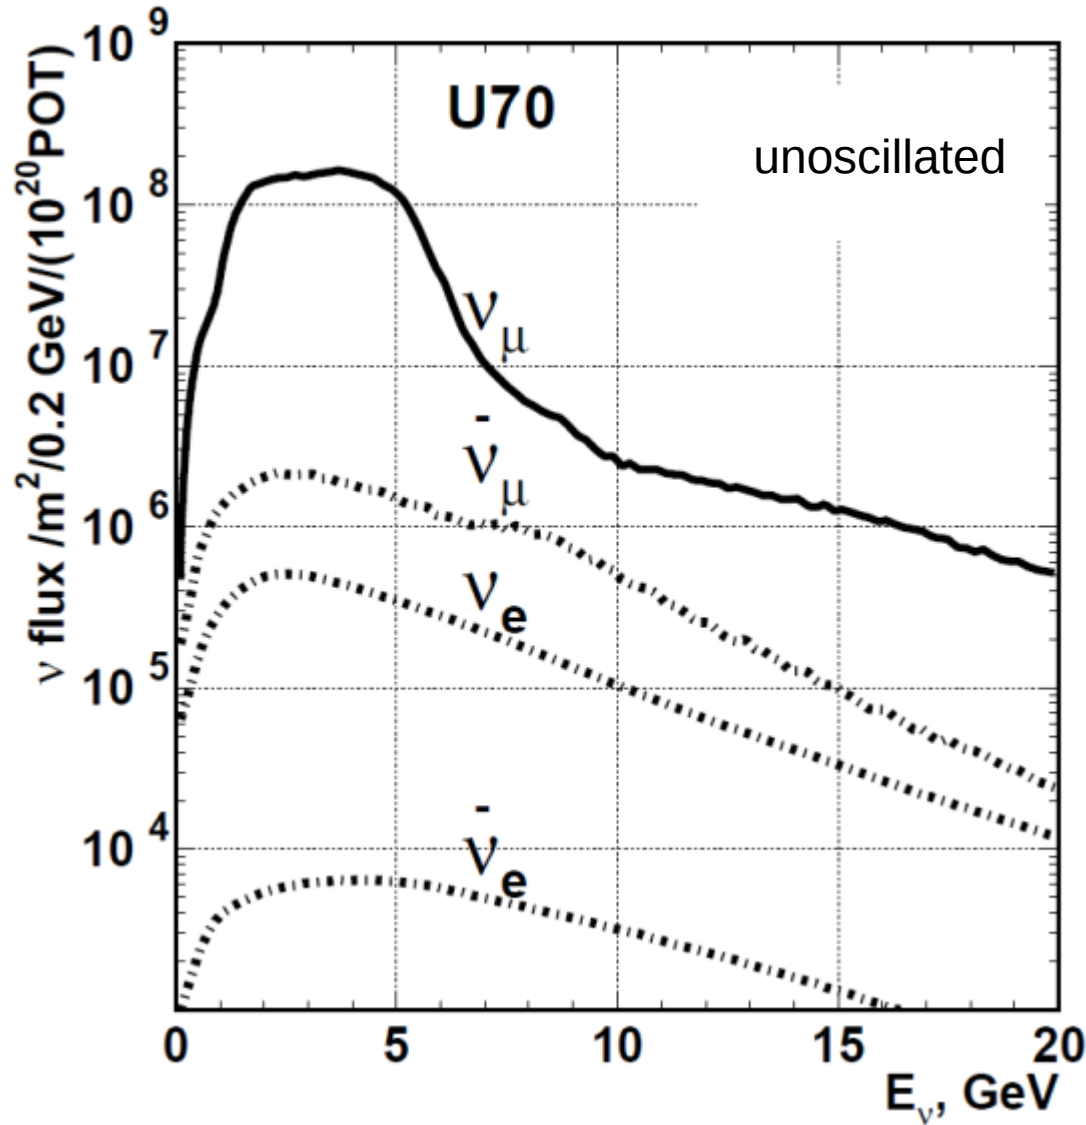

The OMEGA project proposal

- New high intensity linac and booster synchrotron (3.5 GeV)
- 1.1 MW proton beam
- High-intensity spallation neutron source (similar to J-PARC in Japan and SNS in USA)
- 450 kW power at 70 GeV using existing U-70 synchrotron
- A long baseline neutrino beam

N.E. Tyurin et al, Facility for intense hadron beams (letter of intent),
News and Problems of Fundamental Physics 2 (9), 2010,
<http://exwww.ihep.su/ihep/journal/IHEP-2-2010.pdf>

Simulated Neutrino Beam

Beam spectra from *V. Garkusha, F. Novoskoltsev & A. Sokolov, Study of Neutrino Oscillations with the U-70 Accelerator Complex, IHEP Preprint 2015-5* – beam optimized for Protvino-Gran Sasso (on-axis)

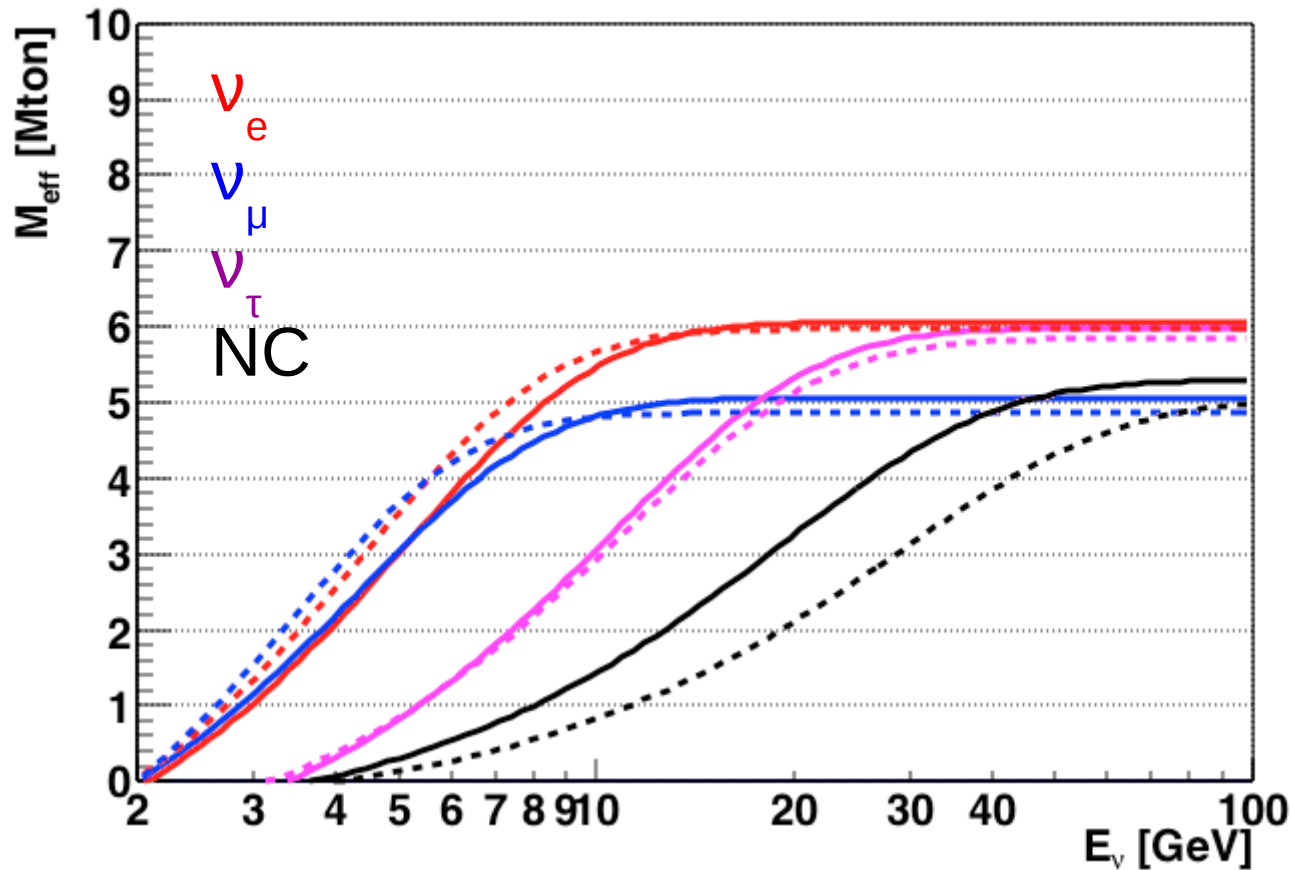

Focus π^+ (Neutrino beam)

Beam power : 450 kW,
 $4 * 10^{20}$ p.o.t. per year

(for reference:
Fermilab-Nova beam is 700 kW)

ORCA effective mass

After triggering, atmospheric muon rejection and containment cuts

For reference,
atmospheric
neutrino events/yr:

ν_e CC: 17,300

ν_μ CC: 24,800

ν_τ CC: 3,100

NC: 5,300

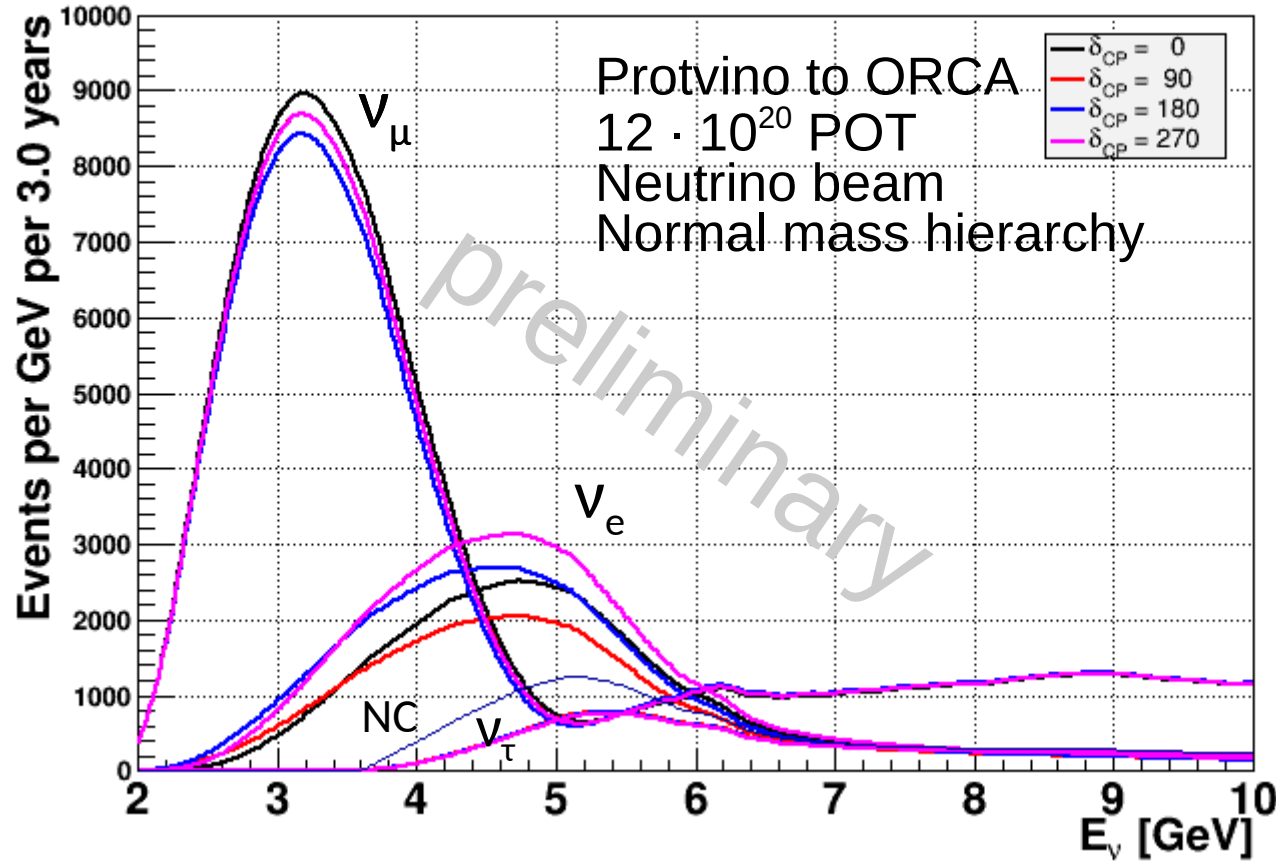

**Analysis has not
been optimized for
beam neutrinos (yet)**

- Energy threshold determined by DOM spacing
- 1 Mton @ 3 GeV
- 6 Mton @ 10 GeV

Expected neutrino rates in ORCA

normal mass hierarchy

Raw event numbers in ORCA

Calculations with GLOBES

After 3 years of 450 kW beam:

ν_μ CC: ~ 30000 events

ν_e CC: ~ 8000 events

ν_τ CC: ~ 3500 events

NC: ~ 6000 events

For comparison:

DUNE: ~ 900 ν_e events / yr

Vacuum oscillation maximum at $E = 5.1$ GeV

Most ν_μ convert to ν_τ which remains largely invisible (CC reaction suppressed by τ mass)

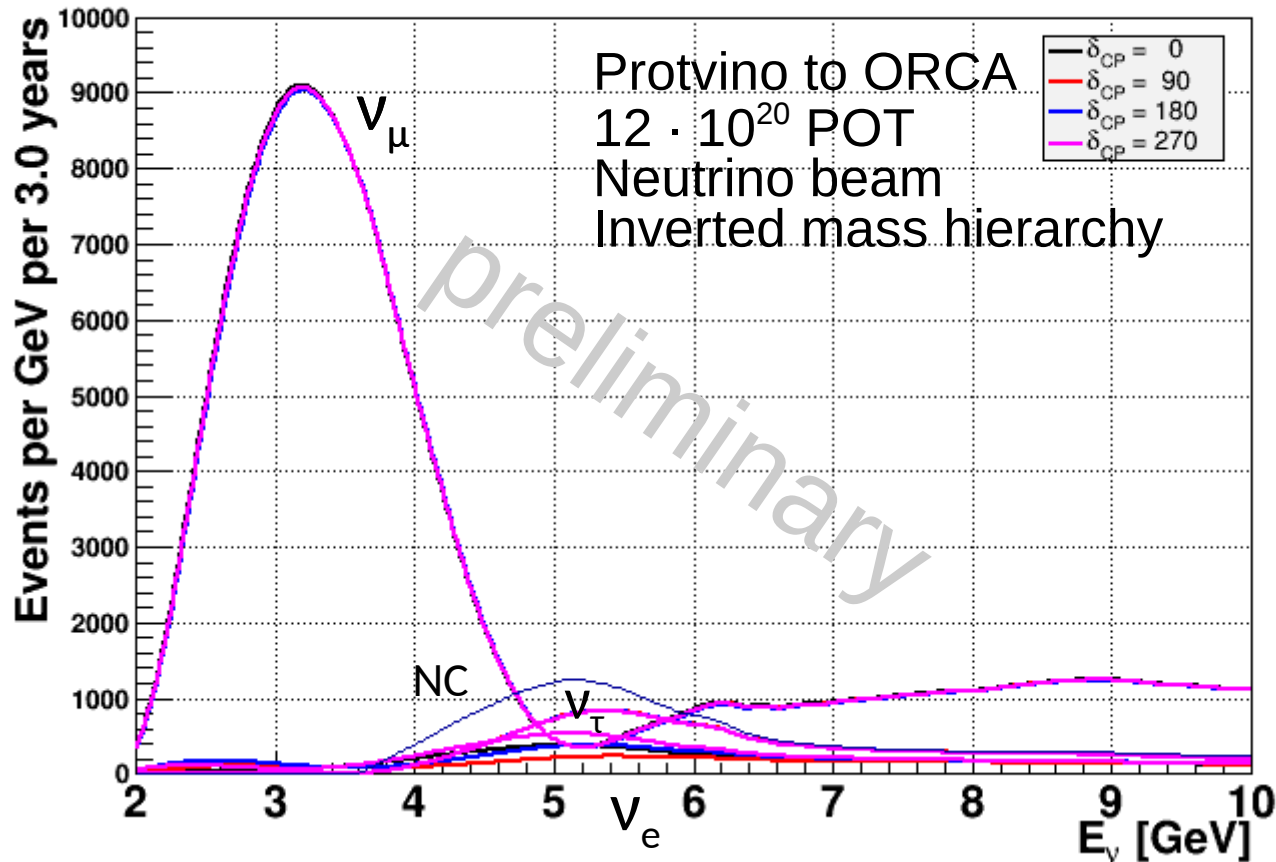

$\nu_\mu \rightarrow \nu_e$ transitions are enhanced by the MSW effect, resonance energy 3.8 GeV

Expected neutrino rates in ORCA

inverted mass hierarchy

Raw event numbers in ORCA

Calculations with GloBES

ν_{μ} CC: ~ 30000 events

ν_e CC: ~ 2000 events

ν_{τ} CC: ~ 3700 events

NC: ~ 6000 events

$\nu_{\mu} \rightarrow \nu_e$ transitions suppressed by the MSW effect

If inverted mass hierarchy is true, switch to anti-neutrino beam (for CPV studies)

Multi-Parameter fit of simulated data

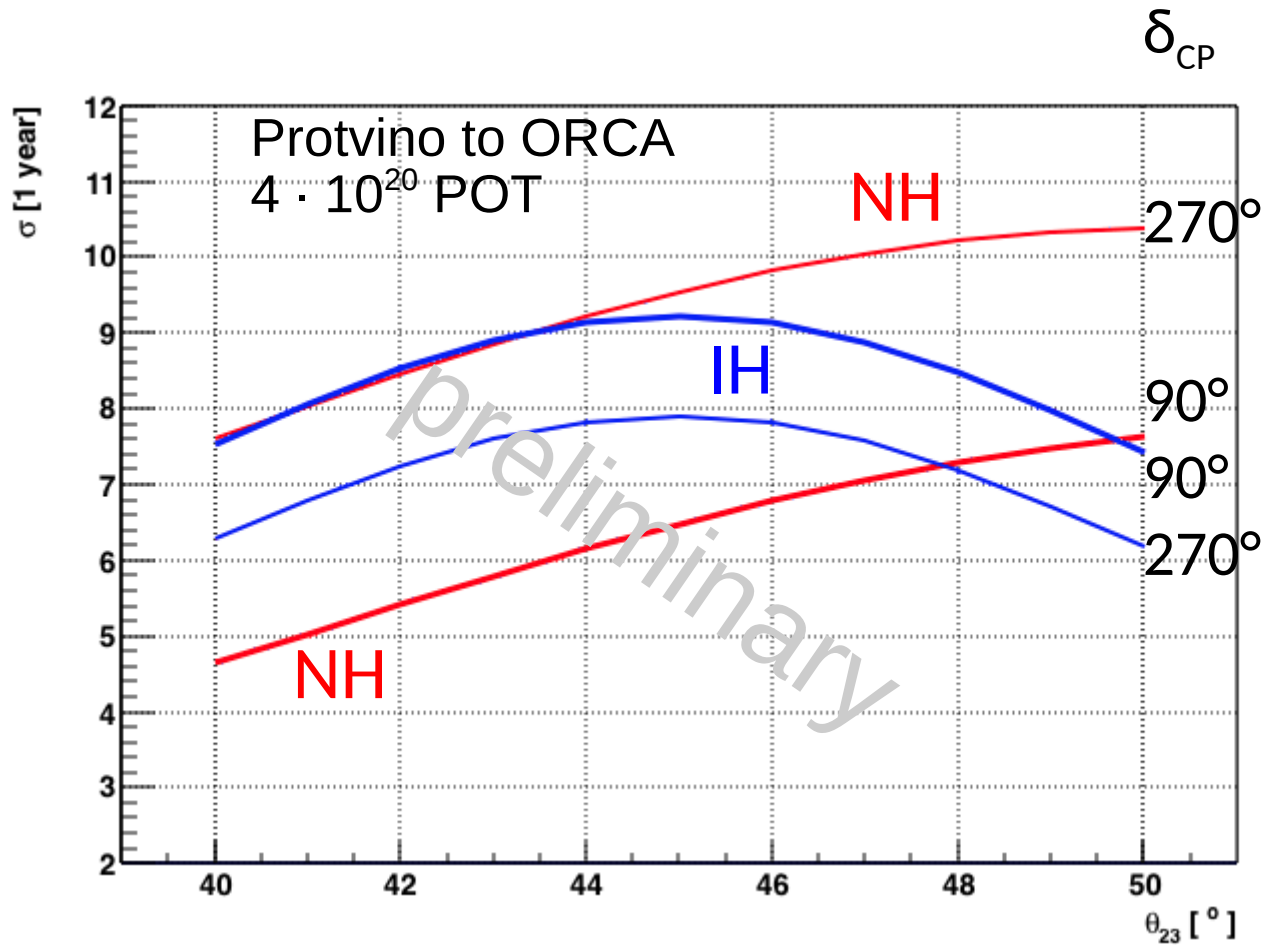

- Combined fit of nuisance and oscillation parameters
- No neutrino/anti-neutrino skew
- No spectral index skew
- No energy scale shift

| Parameter | True value | Prior | Start value |
|---------------------------------|----------------------|--------------|----------------------|
| θ_{12} | 33.4° | fix | fix |
| Δm^2 [eV ²] | $7.53 \cdot 10^{-5}$ | fix | fix |
| θ_{13} | 8.42° | 0.15° | 8.42° |
| θ_{23} | 41.5° | 1.3° | 41.5° |
| ΔM^2 [eV ²] | $2.44 \cdot 10^{-3}$ | 0.06 | $2.44 \cdot 10^{-3}$ |
| δ_{CP} | many | no | many |

| Parameter | True value | Prior | Start value |
|--------------------|-------------------|-------|-------------|
| Norm ν_e CC | from ν_μ CC | fix | fix |
| Norm ν_μ CC | 1 | 0.05 | 1 |
| Norm ν_τ CC | 1 | 0.10 | 1 |
| Norm NC | 1 | 0.05 | 1 |
| PID | 1 | 0.10 | 1 |
| $\nu / \bar{\nu}$ | 1 | fix | fix |

* Only used for CP fits, not for NMH

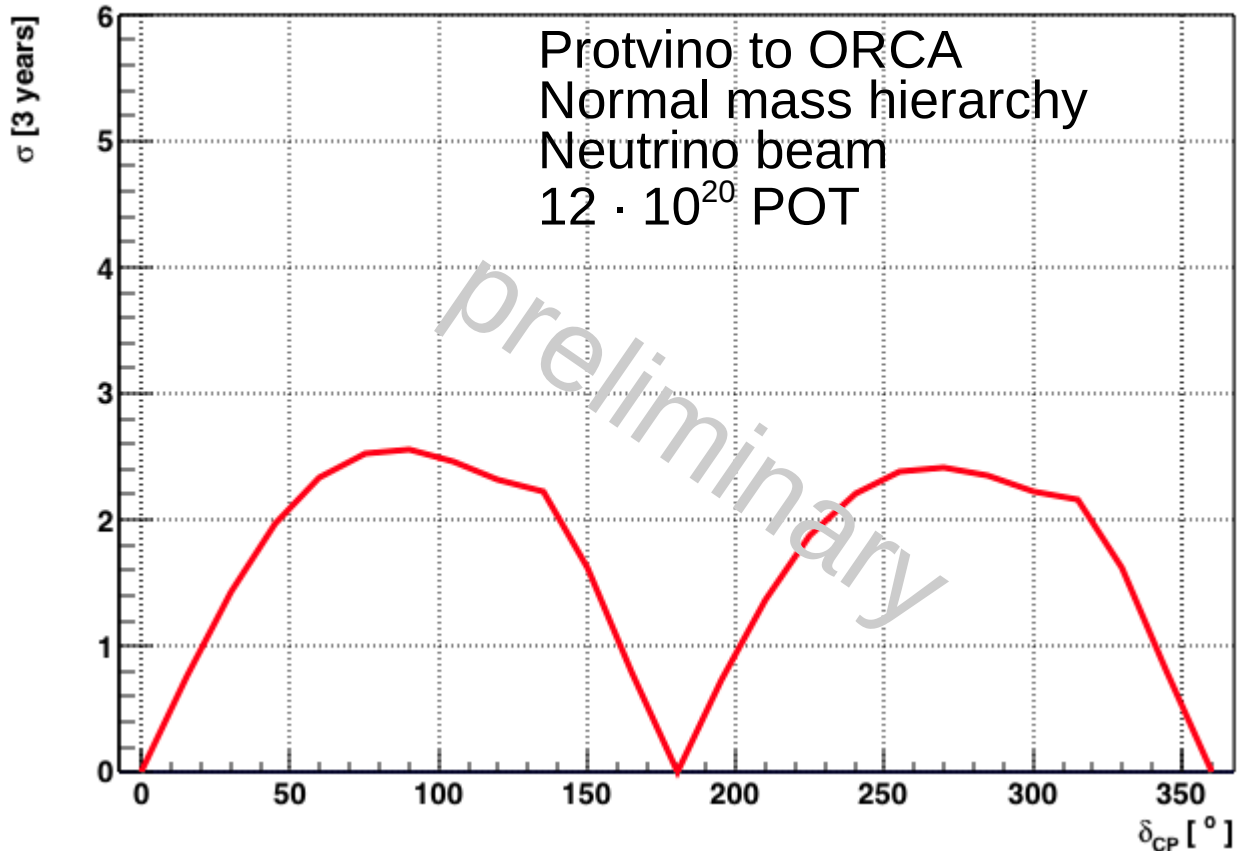

P2O sensitivity to mass hierarchy

> 5 sigma after 1 year of 450 kW beam

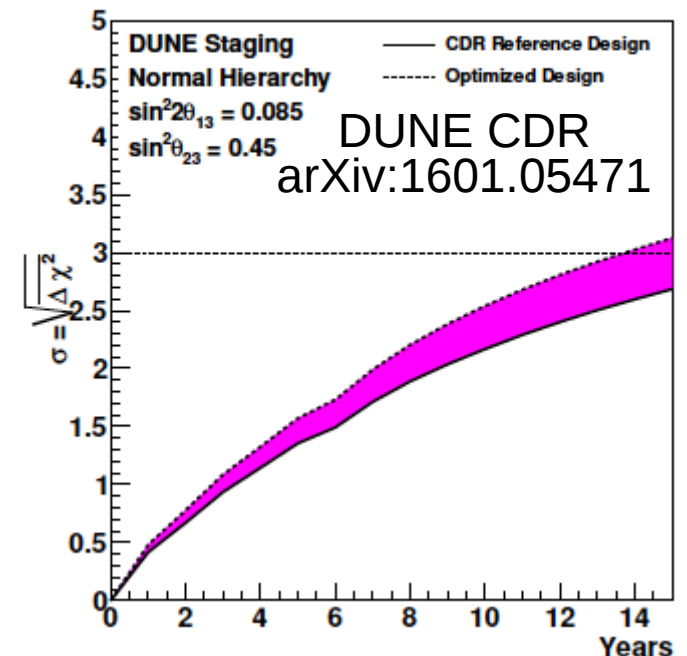

Sensitivity to CP violation

$$U = \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \times \begin{pmatrix} c_{13} & 0 & e^{-i\delta} s_{13} \\ 0 & 1 & 0 \\ -e^{i\delta} s_{13} & 0 & c_{13} \end{pmatrix} \times \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

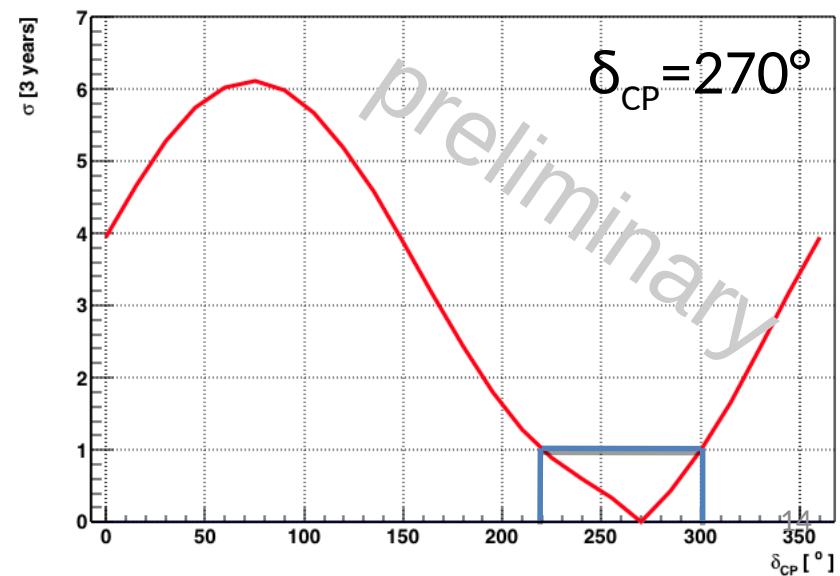

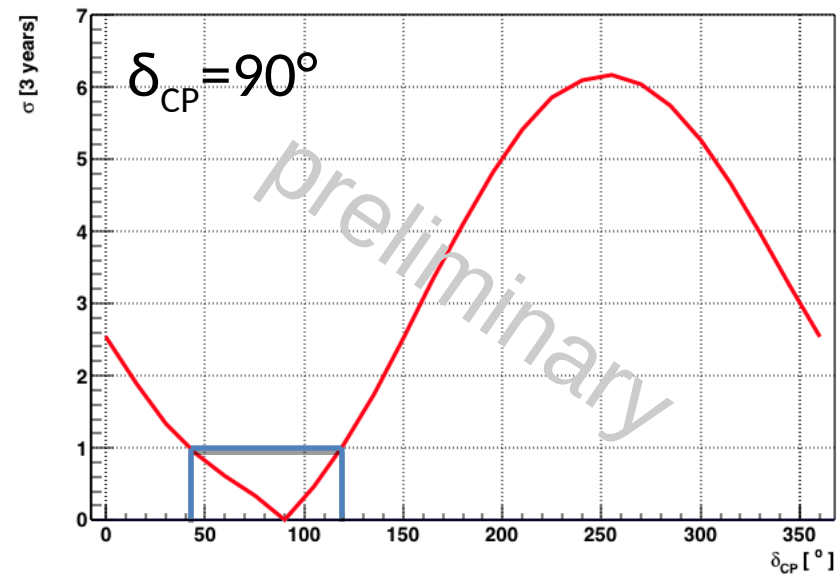

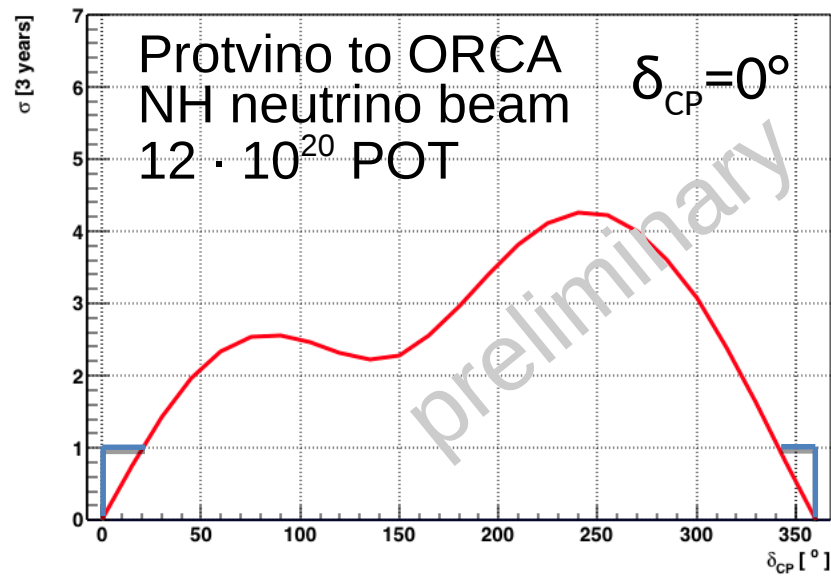

Competitive
with DUNE!

75% CP Violation Sensitivity

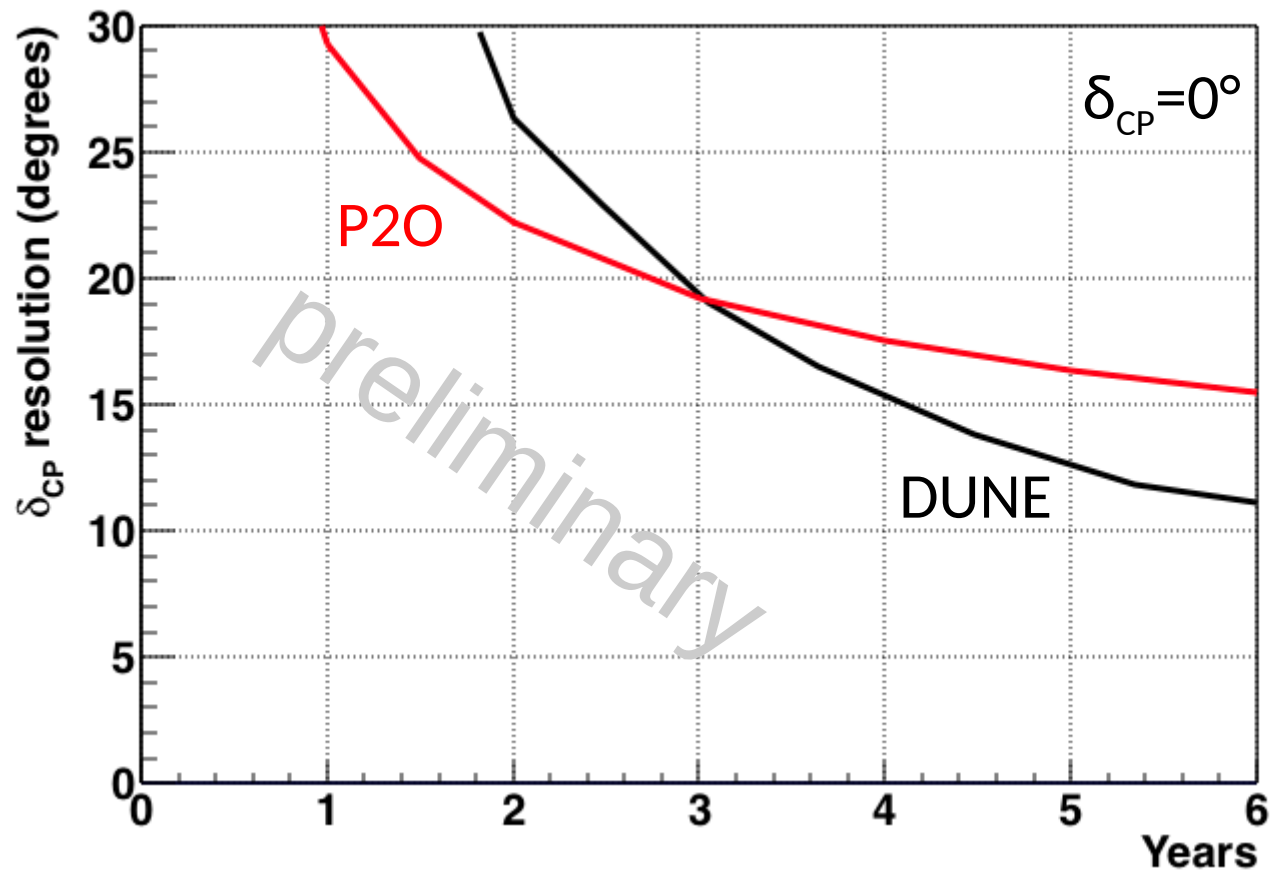

~ 2 sigma after 3 years of 450 kW beam

Simulated measurement of δ_{CP}

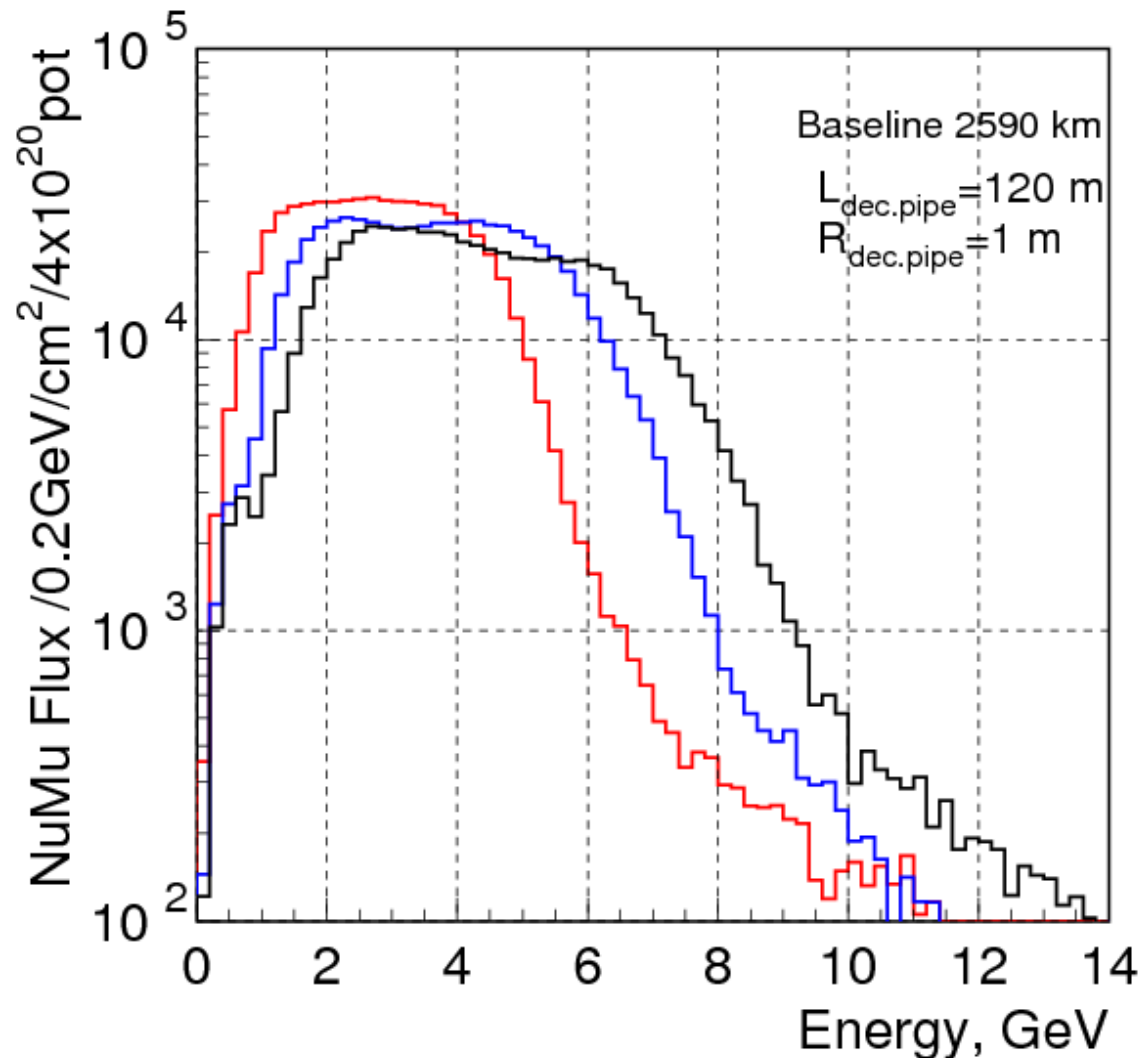

Measurement accuracy for δ_{CP}

NB: this study uses preliminary estimates of systematic uncertainties

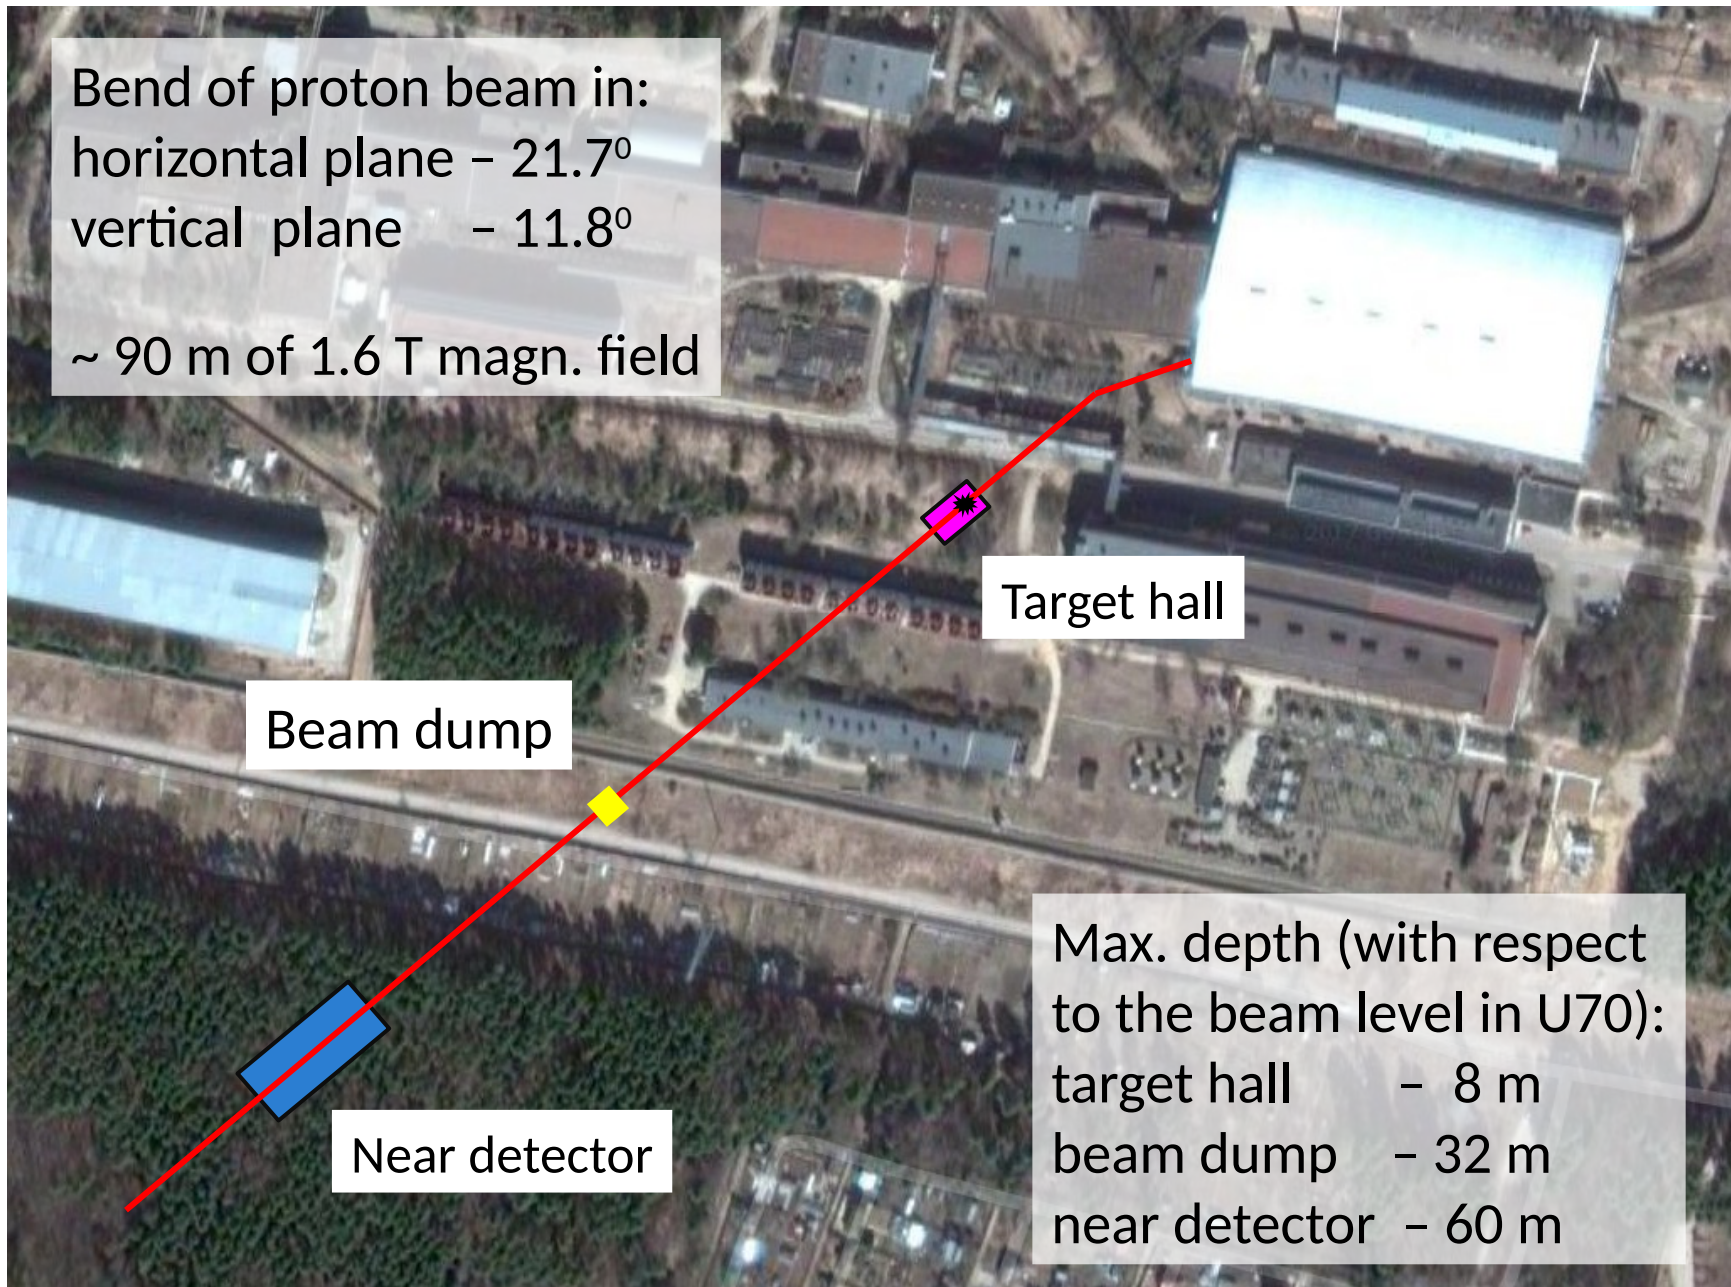

Beam optimization (work in progress)

- Red: two 3 m horns as in arXiv:1412.0804
- Blue: target shifted towards the beam
- Black: target shifted towards the beam + horns moved further away from each other

Idea: choose the beam option which gives best sensitivity to CP violation

Possible location of the neutrino beam line

Thinking of Near detector

T2K-like?

Water tank?

?

?

DUNE-like?

High granularity?

... ?

?

Water-based scintillator?

Cross-section measurements?

?

Suggestions are very welcome

The low intensity (& low cost) option

- Use existing accelerator chain upgraded to maximum possible intensity
- Assume we have a 45 kW beam (upgrade to 30 kW currently in progress)
- Assume we gain a factor of 2 by optimizing the beam and the ORCA data analysis

5 sigma on mass hierarchy after 5 yr of 45 kW beam

but marginal sensitivity to CP violation, unless ORCA is also upgraded

Could serve as Phase 1 on the way to full intensity

Conclusion

- Directing a neutrino beam from Protvino to ORCA is of high scientific interest
- Determination of the neutrino mass hierarchy with a high statistical significance and well controlled systematic uncertainties
- Measurement of the CP-violating phase δ (competitive with DUNE, T2HK)
- Informal collaboration with IHEP established, initiative supported by IHEP directorate

New collaborators are welcome

Backup slides

Particle ID

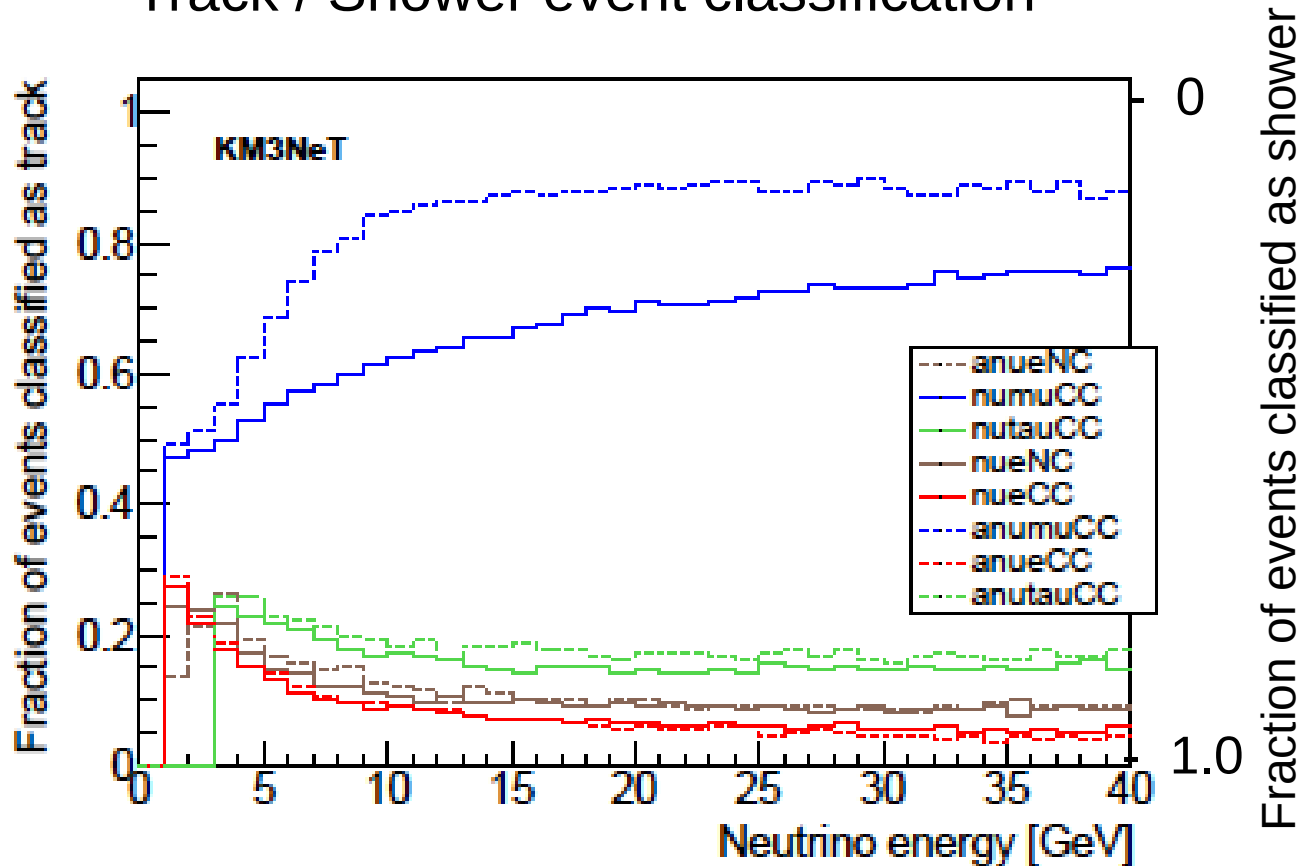

Hadronic shower + muon track

Particle ID performance

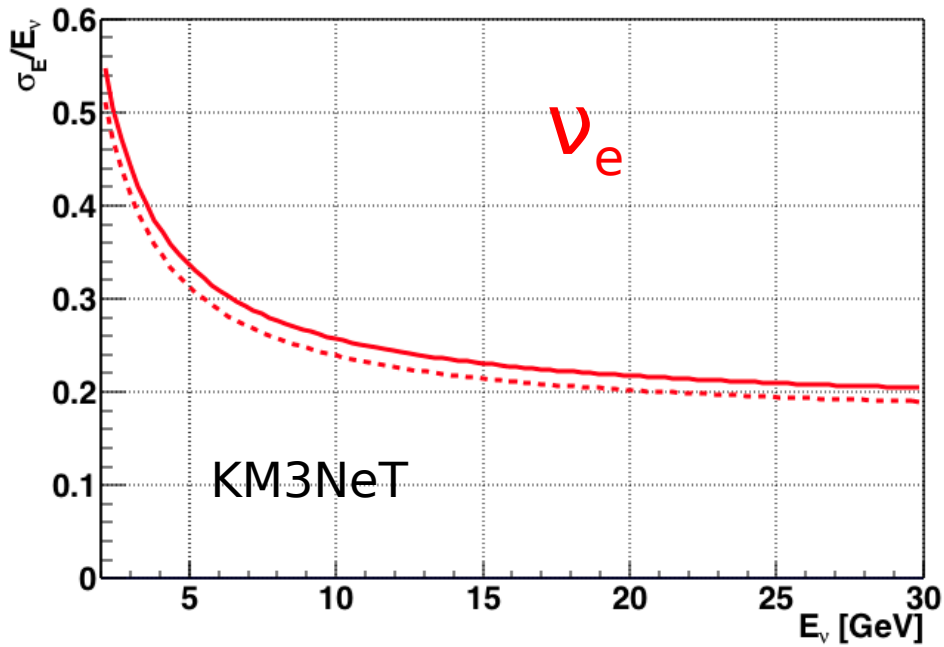

Track / Shower event classification

At 10 GeV:

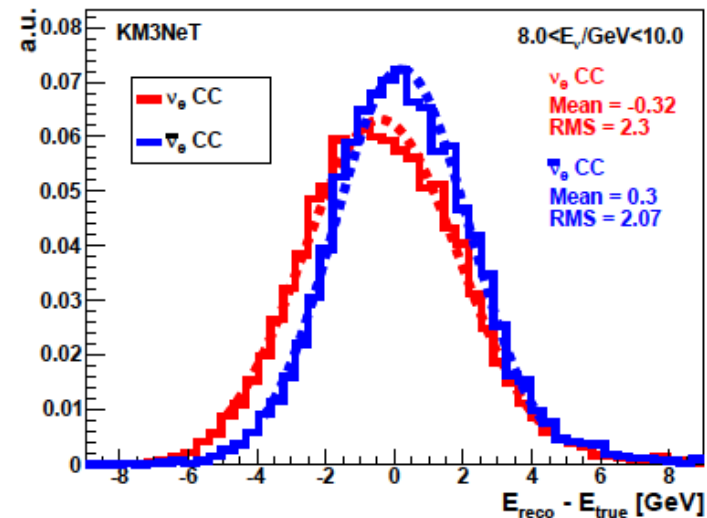

- 90% correct ID of n_e^{CC}
- 70% correct ID of n_m^{CC}

Energy resolution

Energy resolution better than 30% in relevant range

Distribution close to Gaussian

Benefits of beam neutrinos

- Clean muon neutrino or anti-neutrino beam (chosen by horn polarity)
 - Flavor oscillations more pronounced (ν_μ / ν_e)
 - Matter effect more pronounced ($\nu / \text{anti-}\nu$)
- Known baseline
 - No zenith angle uncertainty
- Known direction
 - kinematics constraints
 - better event reconstruction / particle ID possible
- Short beam spills
 - Factor 1 000 000 suppression of atmospheric muon and atmospheric neutrino backgrounds
 - Background estimation from “off” data

Neutrino mass hierarchy (ordering)

normal hierarchy (NH)

inverted hierarchy (IH)

$\Delta m^2_{\text{solar}}$: sign known

$\Delta m^2_{\text{atmospheric}}$: sign unknown

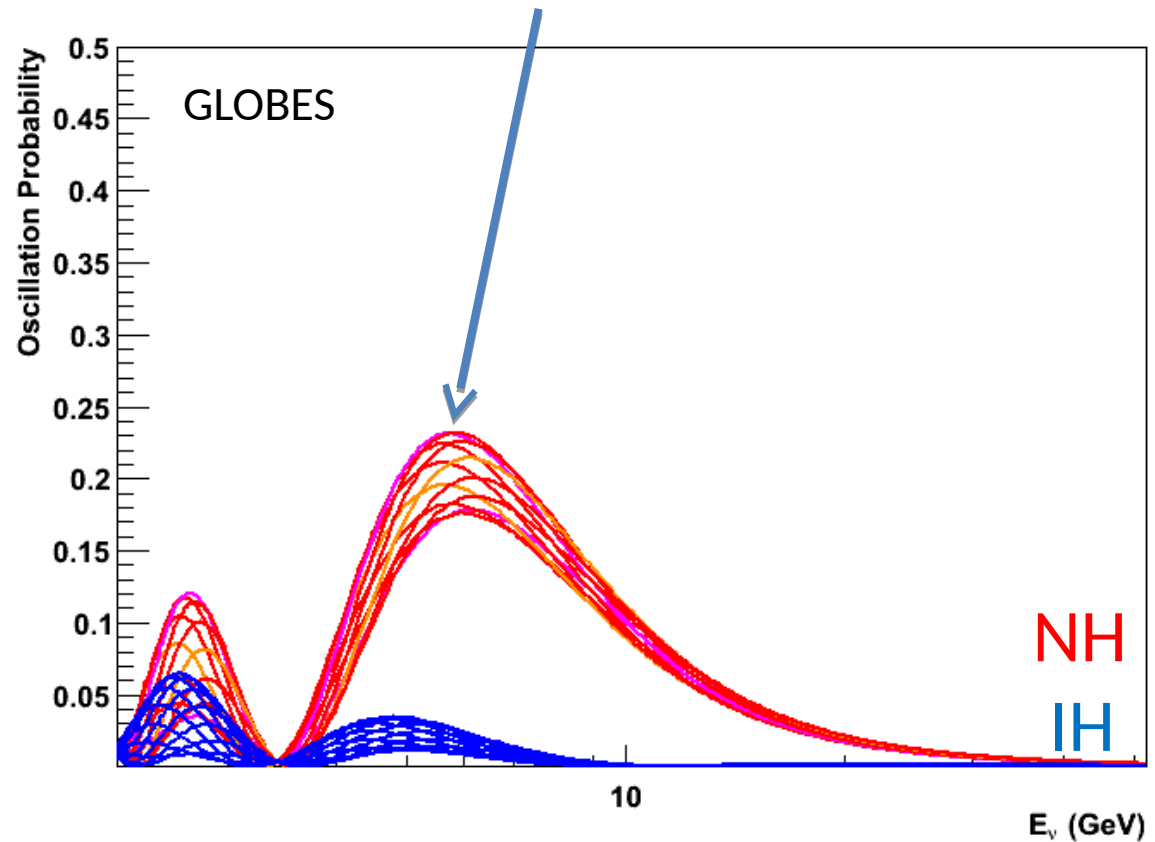

Important for theory, $0\nu\beta\beta$, ...

Peak energy example

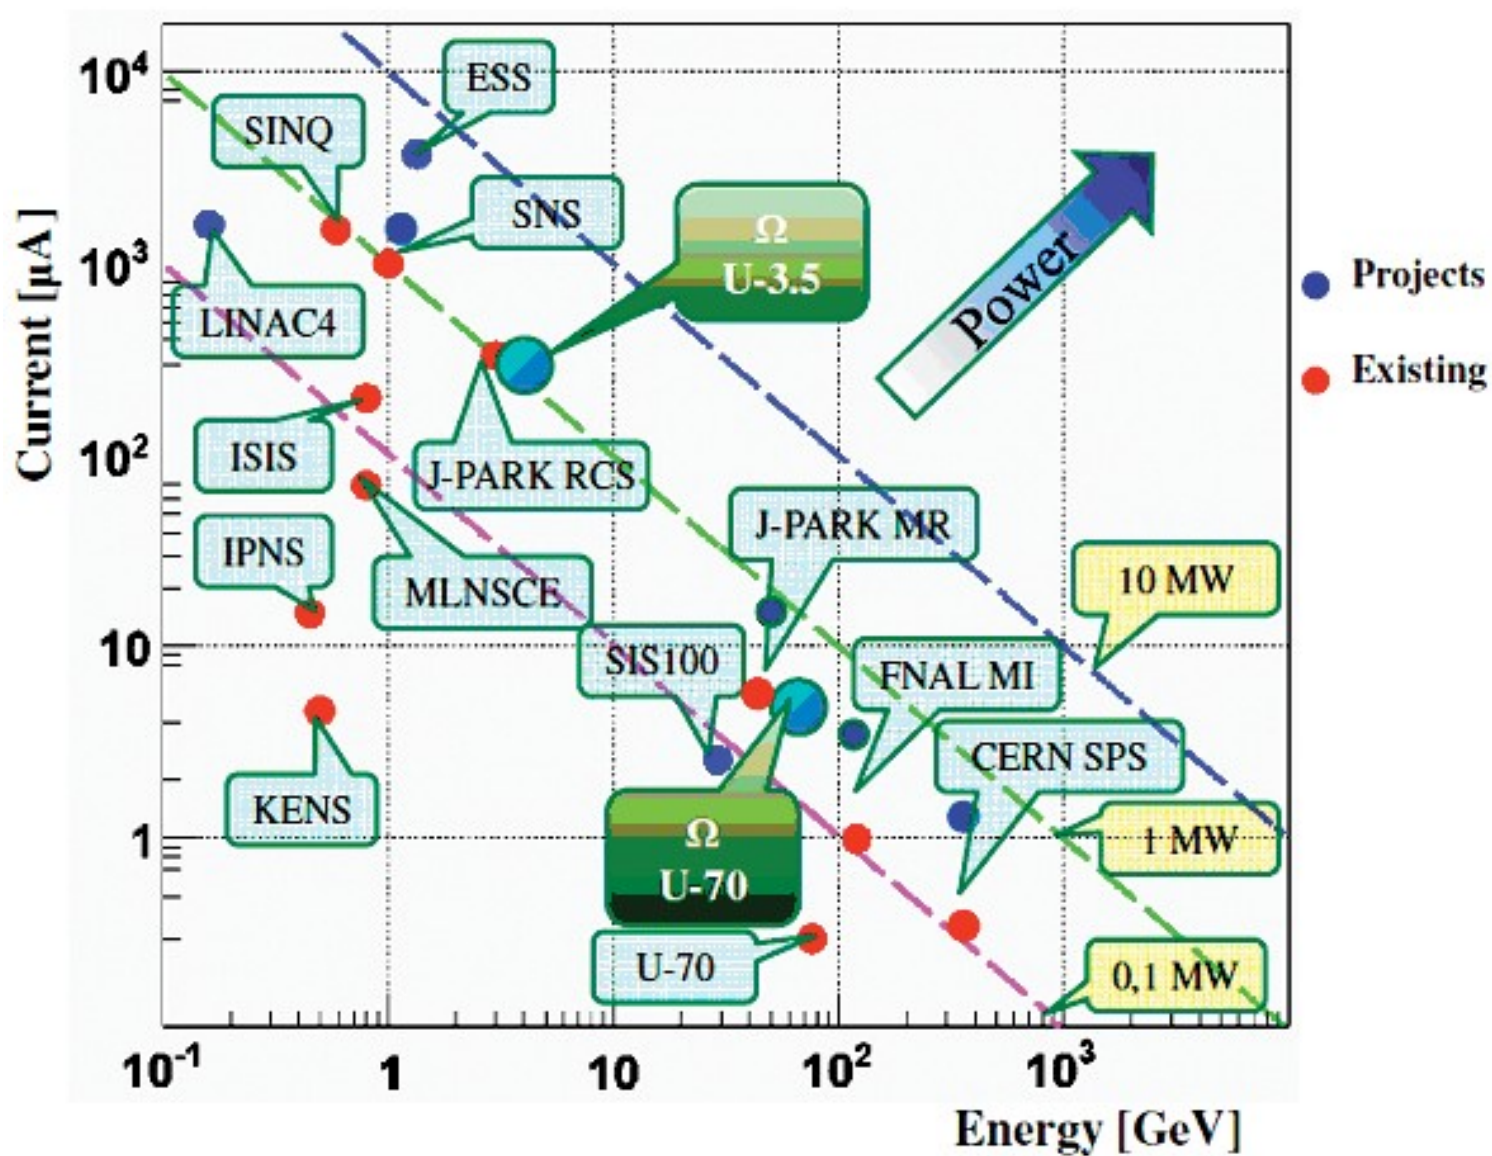

$P(\nu_\mu \rightarrow \nu_e)$ peak energy

$\cos \theta = 0.4$
Baseline = 5097 km
Inclination = 23.6°

The OMEGA project

The OMEGA project proposal (continued)

- Intended primarily for applied research (material science, protein structure, rapid processes, etc)

ESS: European Spallation Source: 2-5 MW, under construction in Lund, Sweden

PIC: 100 MW nuclear reactor, NRC «Kurchatov Institute» – PNPI, Gatchina (near St. Petersburg), construction 1976-2019

Cost estimates

Table extracted from the OMEGA project Lol

| Nº | Object | Cost (million rubles) | M € (approx) |
|----|------------------------------------|--------------------------|-----------------|
| 1 | Linac LU-400 | 7 200 | 180 |
| 2 | RC PS U-3.5 | 10 100 | 250 |
| 3 | Neutrino channel | 1 500 | 40 |
| 4 | Near Neutrino Detector | 1 000 | 25 |
| 5 | Neutron source (target station T1) | 8 400 | 210 |
| 6 | Neutron research set-ups | 1 500 | 40 |
| 7 | Injection from U-3.5 to U-70 | 800 | 20 |
| 8 | Target stations T2 and T3 | 800 | 20 |
| 9 | Infrastructure | 700 | 17 |
| 10 | Total | 32 000 | 800 |

Using 2003 exchange rate 40:1

Costs dominated by accelerator construction and neutron source
