DAMPE Mission and Its First Result

Li Xiang

Purple Mountain Observatory, CAS
(on behalf of the DAMPE collaboration)

The collaboration

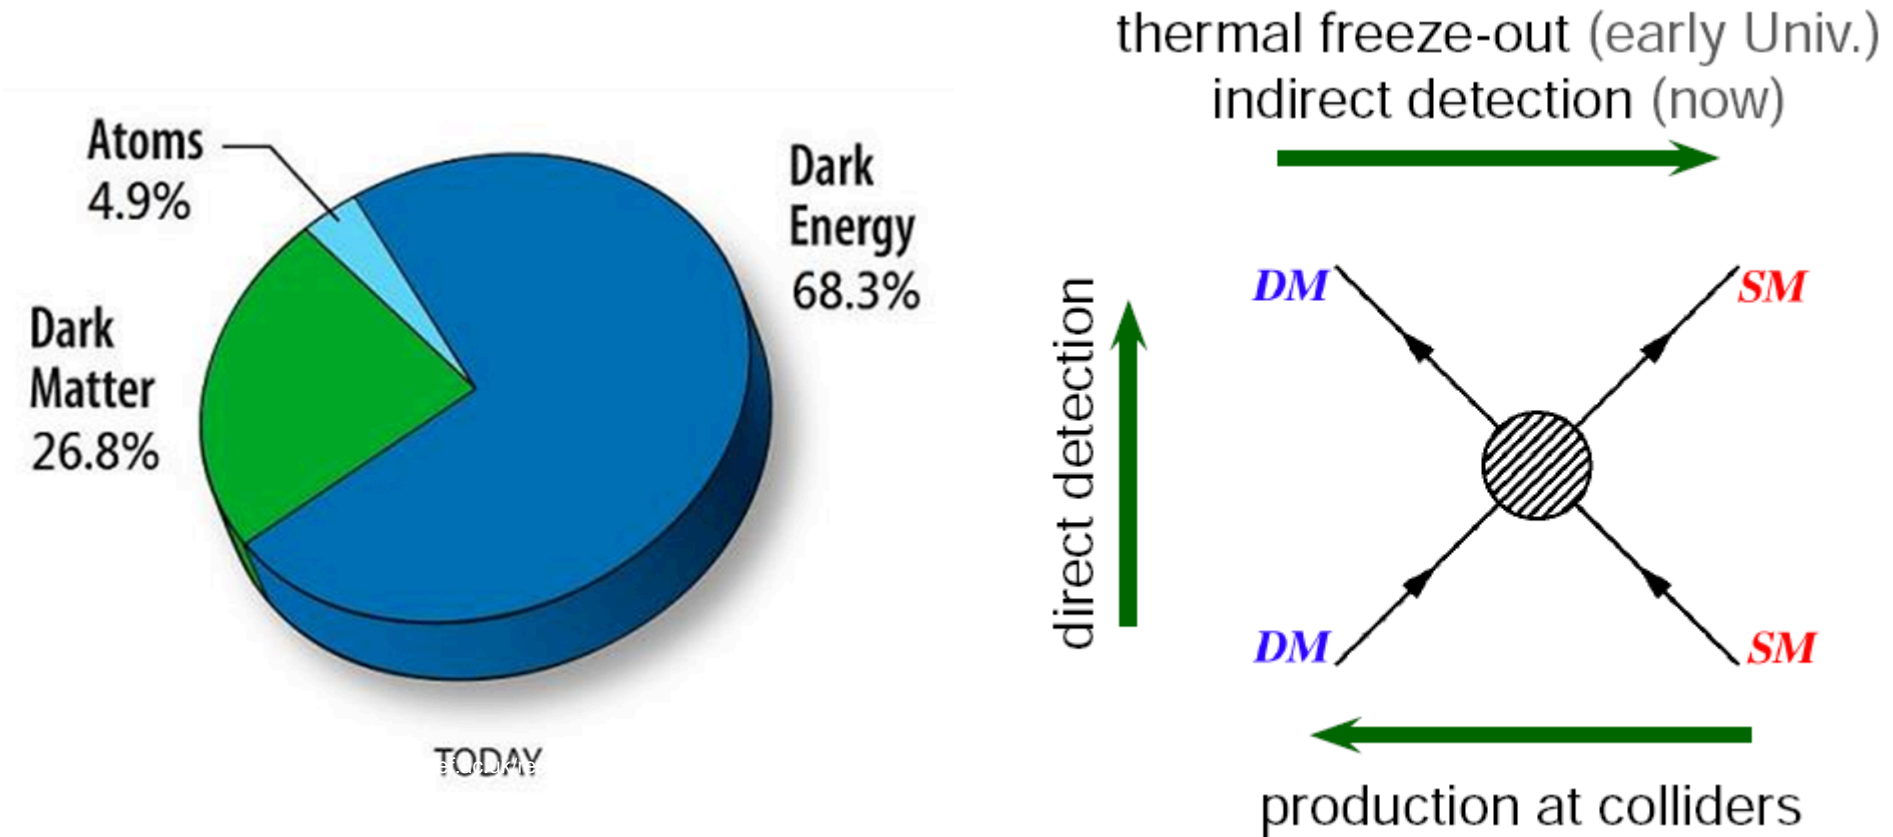

- **PI of DAMPE: Jin Chang from PMO**
- **CHINA**
 - Purple Mountain Observatory, CAS, Nanjing
 - University of Science and Technology of China, Hefei
 - Institute of High Energy Physics, CAS, Beijing
 - Institute of Modern Physics, CAS, Lanzhou
 - National Space Science Center, CAS, Beijing
- **ITALY**
 - INFN Perugia
 - INFN Bari
 - INFN Lecce
- **SWITZERLAND**
 - University of Geneva

Outline

- **Background**
- **DAMPE mission**
- **First Result**

Dark matter

- Compelling astrophysical evidence for dark matter
- New particle or modified gravity?
- Three detection methods

Dark matter indirect detection

Dark matter particles may annihilate and then generate pairs of particles and anti-particles (gamma-rays, electrons/positrons, proton and antiprotons), see e.g., Bergström & Snellman 1988, Turner & Wilczek 1990

Dark matter indirect detection

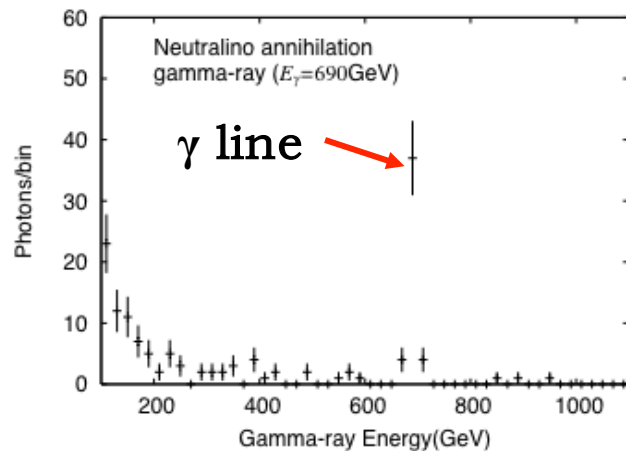

**DM signal in anti-particles
(AMS-02 like detectors):
lower background**

**Electrons: relatively small
contrast between the
electron and positron flux**

**Gamma-rays and
neutrinos: trace the source**

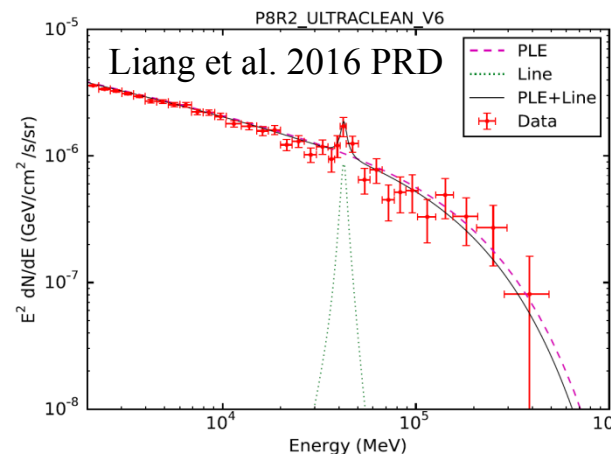

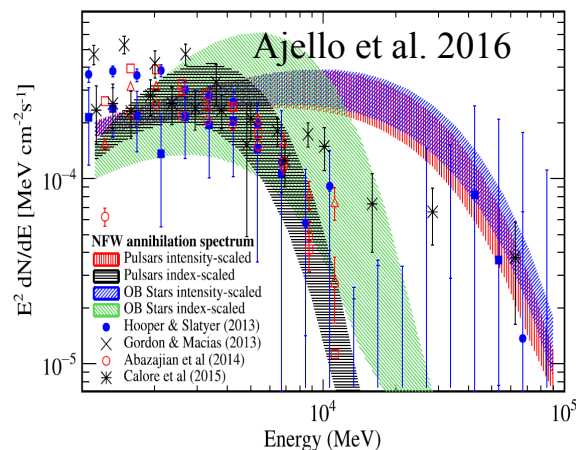

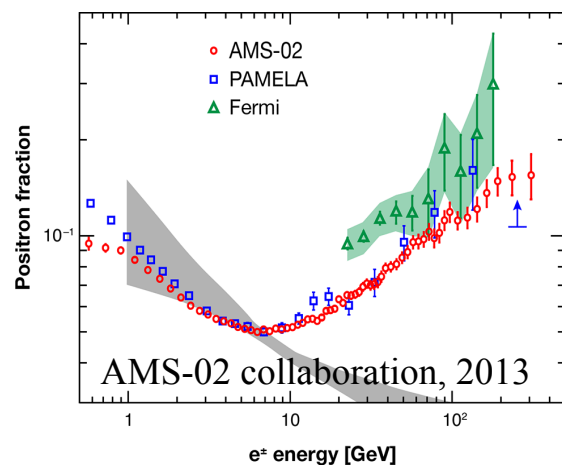

Possible DM signal in γ -rays and electrons

- The γ -ray line
- Continual γ -ray emission spatially correlated with the DM distribution
- Electrons with unusual spectrum

Dark matter indirect detection

Some previous/current experiments and hints

Dark Matter Particle Explorer

Proposed: 2005
Founded: 23 Dec. 2011
Launched: 17 Dec. 2015

悟空
Wukong

● Scientific objectives:

- (a) Probing the nature of dark matter
- (b) Understanding acceleration and propagation of cosmic rays
- (c) Studying γ -ray emission from Galactic and extragalactic sources

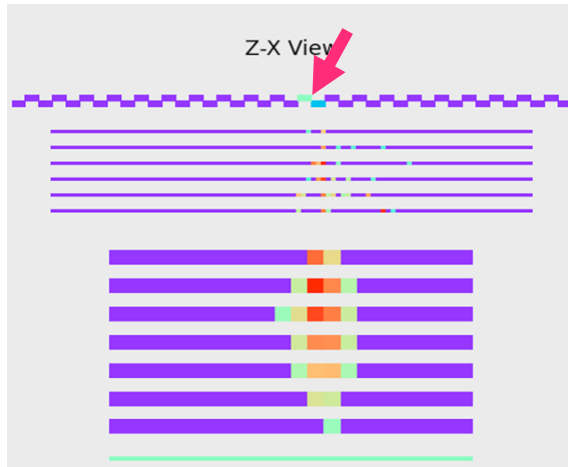

The payload

- Charge measurement (dE/dx in PSD, STK and BGO)
- Pair production and tracking (STK and BGO)
- Precise energy measurement (BGO bars)
- Hadron rejection (BGO and neutron detector)

Signals for different particles

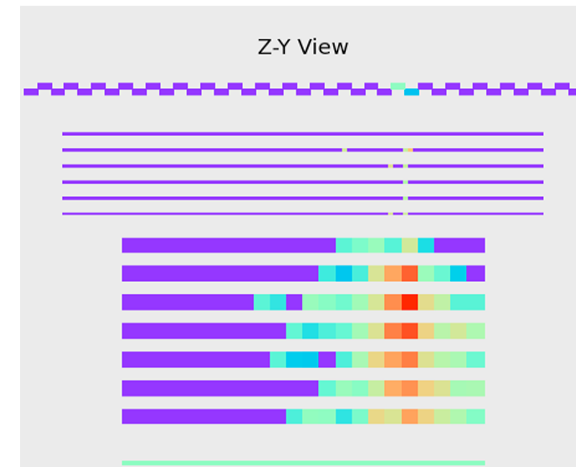

electron

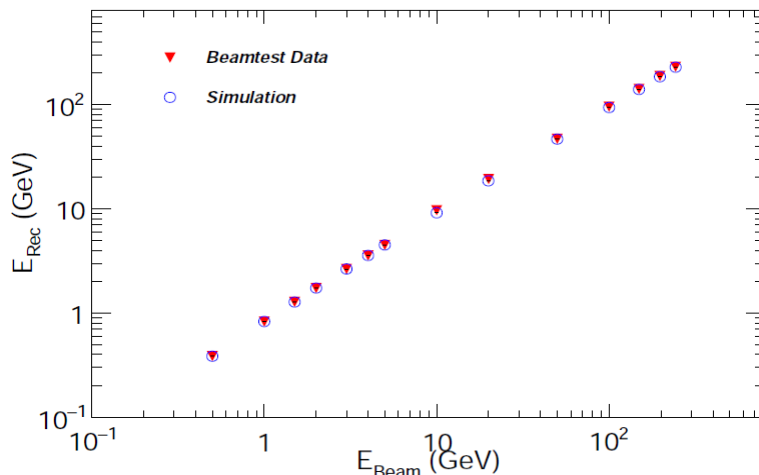

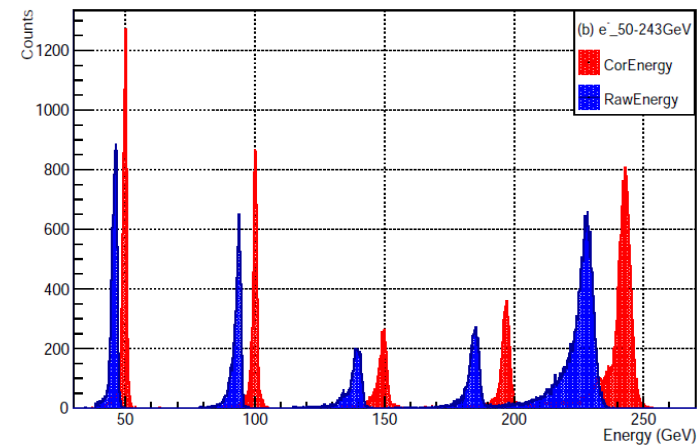

gamma

proton

Beam test @ CERN

Energy linearity of electrons

Energy resolution of electrons

(Chang et al. [DAMPE collaboration] 2017 Astropart. Phys.)

Expected performance

Parameter		Value	
Energy range of gamma-rays/electrons		5 GeV to 10 TeV	
Energy resolution(electron and gamma)		1.5% at 800 GeV	
Energy range of protons/heavy nuclei		50 GeV to 500 TeV	
Energy resolution of protons		40% at 800 GeV	
Eff. area at normal incidence (gamma)		1100 cm ² at 100 GeV	
Geometric factor for electrons		0.3 m ² sr above 30 GeV	
Photon angular resolution		0.1 degree at 100 GeV	
Field of View		1.0 sr	

(Chang et al. [DAMPE collaboration] 2017 Astropart. Phys.)

DAMPE mission

- **Launch: December 17th 2015, CZ-2D rocket**
 - **Total weight ~1850 kg, power consumption ~640 W**
 - **Scientific payload ~1400 kg, ~400 W**
 - **Lifetime > 3 year**

- **Altitude: 500 km**
- **Inclination: 97.4065°**
- **Period: 95 minutes**
- **Orbit: sun-synchronous**
- **16 GB/day downlink**

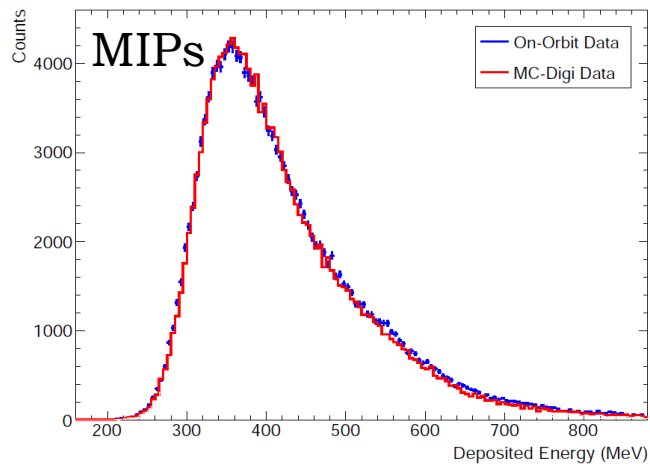

On-orbit trigger rate

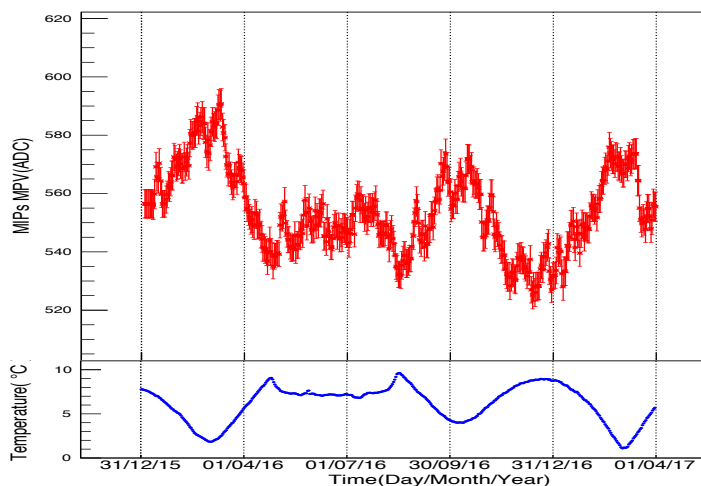

~60 Hz average trigger rate

→ 100GB (H.L.)/day on ground (about 5 M events)

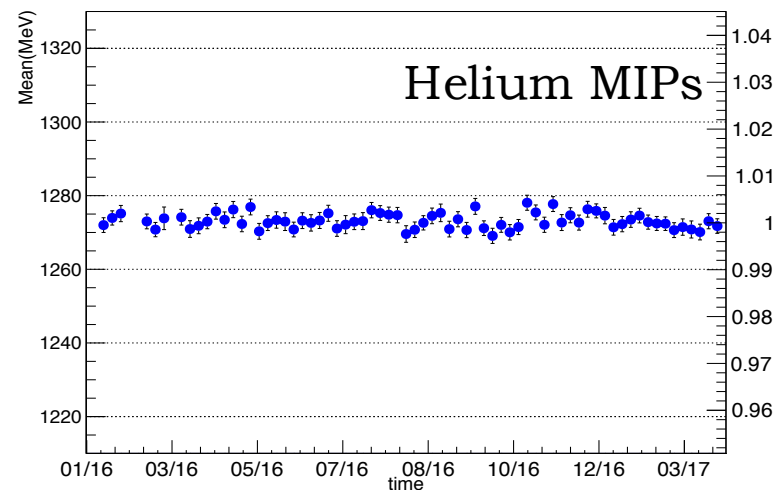

BGO on-orbit calibration: MIPs

Before temperature correction

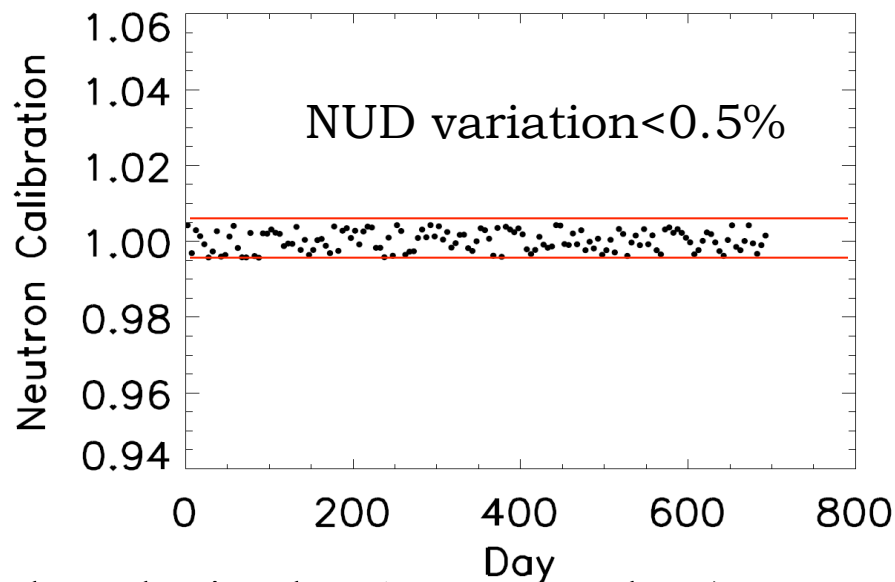

After temperature correction

Satbility of on-orbit performance

(DAMPE collaboration. 2018, to be submitted to Astropart. Phys.)

On-orbit performance: Charge measurement by PSD

On-orbit performance: energy measurement by BGO

The ratio of the energies reconstructed with positive and negative side readout data of BGO crystals, for CRE candidates with deposit energy of 0.5-1.0 TeV

(DAMPE collaboration. 2017, Nature, 552, 63)

On-orbit performance: Absolute energy scale

Dampe Orbit Total Rigidity Cutoff Contour	
Entries	64800
Mean x	176.4
Mean y	1.622
RMS x	102.9
RMS y	26.31

On-orbit performance: e/p separation

For events with deposit energy of 0.5-1.0 TeV; the proton contamination fraction is found to be <3% below 1TeV and <6% in the energy range of 1-2 TeV.

Summary of current data

DAMPE 2 Year Exposure Map (Galactic Coord)

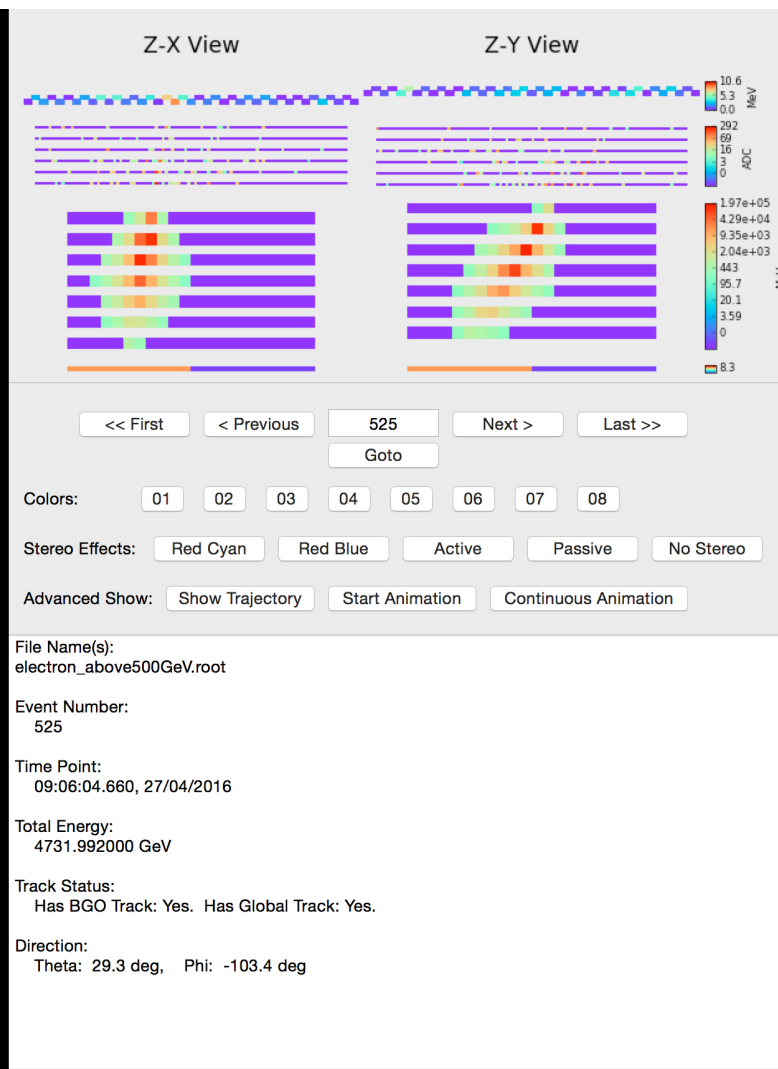

Full sky survey: 4 times

3.7 billion CRs (~5 million/day)

up to the end of 2017

Event: ~ 5 TeV electron candidate

First result: CRE spectrum

(DAMPE collaboration, 2017, Nature, 552, 63)

Some high energy CRE spectra

Error bars: systematic and statistical uncertainties added in quadrature for direct measurements. For H.E.S.S the grey band represents its systematic errors apart from the approximately 15% energy scale uncertainty.

Summary

The detector

- Large geometric factor instrument ($0.3 \text{ m}^2 \text{ sr}$ for electrons)
- Precision Si-W tracker ($40\mu\text{m}$, 0.2°)
- Thick calorimeter ($32 X_0$, σ_E/E better than 1.5% above 50 GeV for e/γ , (20~35)% for hadrons)
- “Mutiple” charge measurements (0.1-0.3 e resolution)
- e/p rejection power $\sim 10^5$ (topology alone, higher with neutron detector)

Launch and performances

- Successfully launched on Dec 17, 2015
- On orbit operation steady and with high efficiencies
- The first CRE spectrum has been published in Dec. 2017
- More results will be released in the future

Some members and partners

Thank you for your attention!

Beam test @ CERN

METHODS

Discrimination between electrons and protons. The method of electron selection in this work relies on the differences in the development of showers initiated by protons and electrons^{23,31,32}. The procedure is as follows. First, we search for events passing through the entire BGO calorimeter. We select events with hit positions from -28.5 cm to 28.5 cm for the top layer and -28 cm to 28 cm for the bottom layer (each BGO bar lies between -30 cm and 30 cm). Second, we calculate the shower spread, expressed by the energy-weighted root-mean-square value of hit positions in the calorimeter. The root-mean-square value of the i th layer is calculated as:

$$\text{RMS}_i = \sqrt{\frac{\sum_j (x_{j,i} - x_{c,i})^2 E_{j,i}}{\sum_j E_{j,i}}} \quad (1)$$

where $x_{j,i}$ and $E_{j,i}$ are the coordinates and deposited energy of the j th bar in the i th layer, and $x_{c,i}$ is the coordinate of the shower centre of the i th layer. Figure 1 shows the deposited energy fraction in the last BGO layer ($\mathcal{F}_{\text{last}}$) versus the total root-mean-square value of all 14 BGO layers (that is, $\sum_i \text{RMS}_i$). We can see that electrons are well separated from protons. Note that in Fig. 1 and Extended Data Fig. 1, heavy ions have already been effectively removed by selection through the plastic scintillator detector, on the basis of the charge measurement.

For a better evaluation of the electron/proton discrimination capabilities, we introduce a dimensionless variable, ζ , defined as

$$\zeta = \mathcal{F}_{\text{last}} \times (\sum_i \text{RMS}_i / \text{mm})^4 / (8 \times 10^6) \quad (2)$$
