

ZTF and Subaru

The stepping stones toward LSST

ZTF | Looking at the variable sky

ZTF @ $z \sim 0.05$ = LSST @ $z \sim 0.5$
+ IFU (SEDMachine) to type any SN brighter than 18.5/19mag

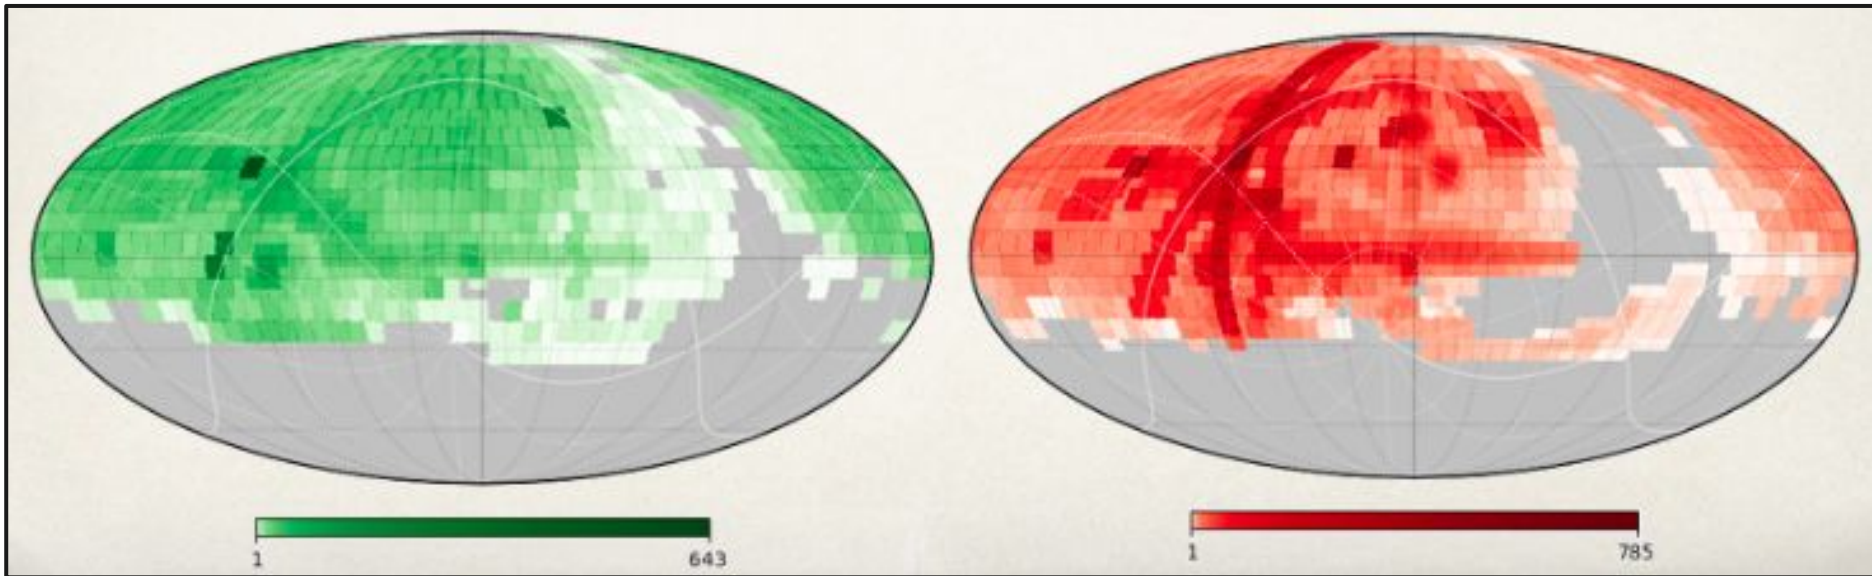

ZTF | Spectro follow up

Dedicated Spectrographer (SEDMachine, P60 1.5m)

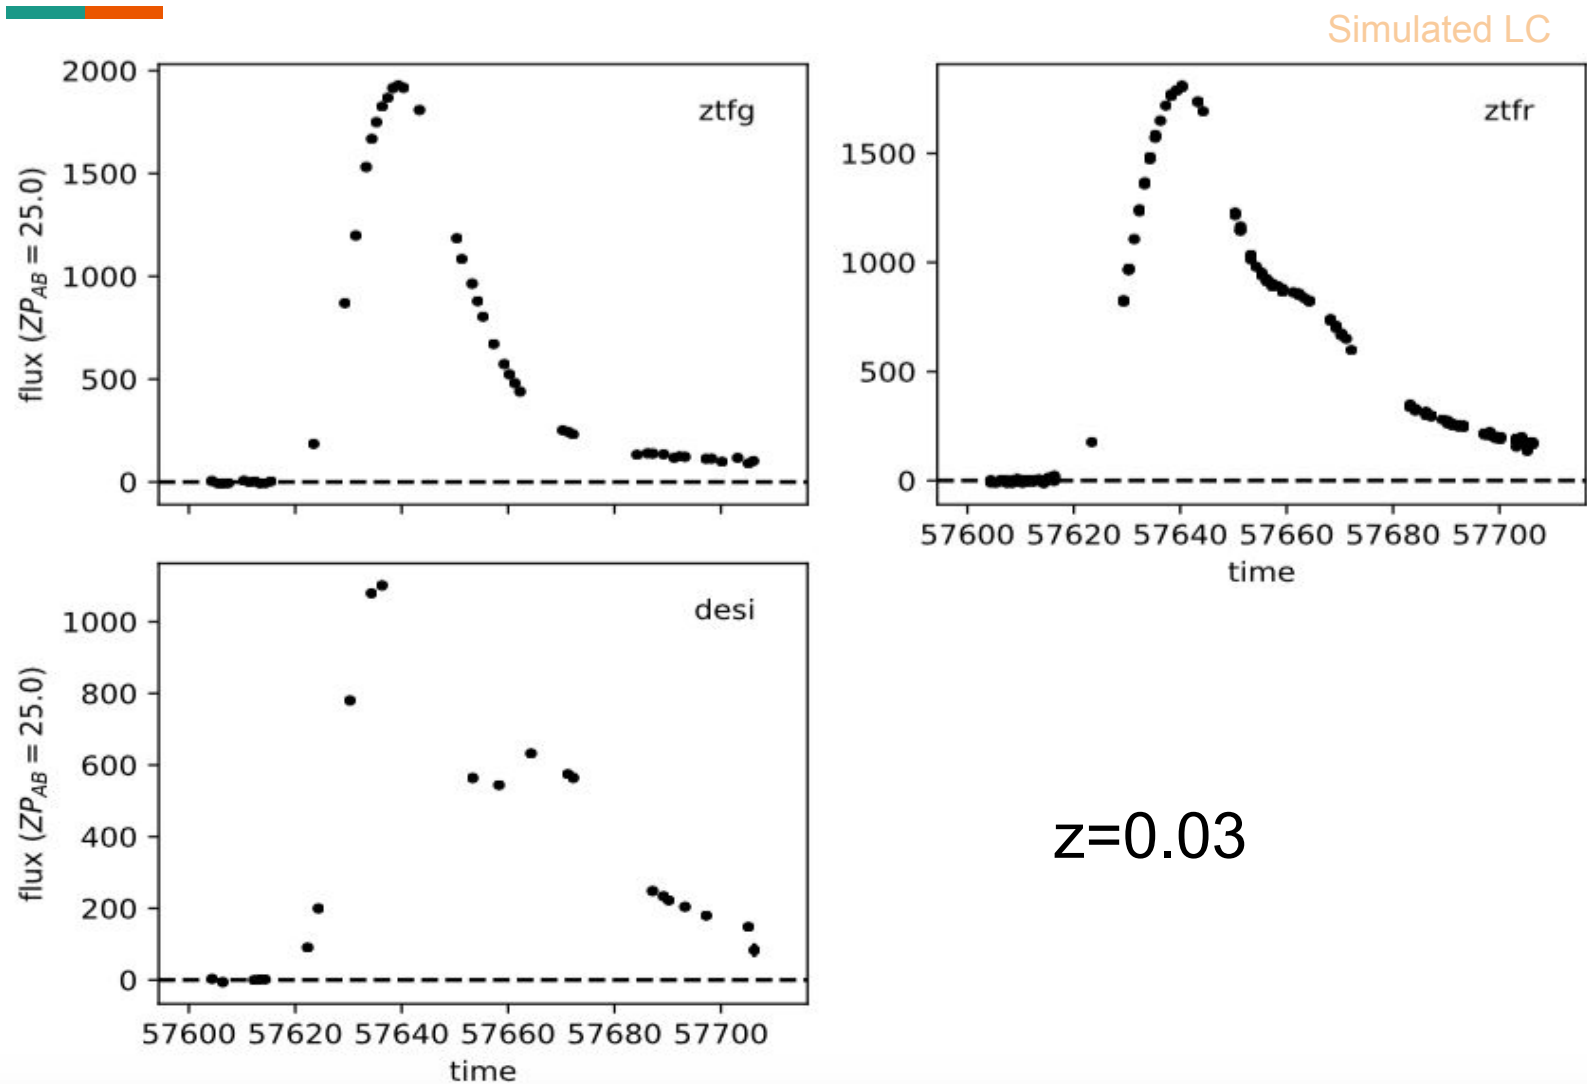

ZTF latest news

- Third Filter (I) will be installed February.
 - Science Survey starts in March.
 - New SEDM machine end of March.
- (all transient with mag>18.5 will be typed i.e, all SNeIa $z<0.07$)*

Activity in ZTFCosmo: Berlin (3 PI) | Stockholm (2+ PI) | France (1 PI) | Berkeley (1 PI)

ZTF | SNe Ia Light Curve Expectation

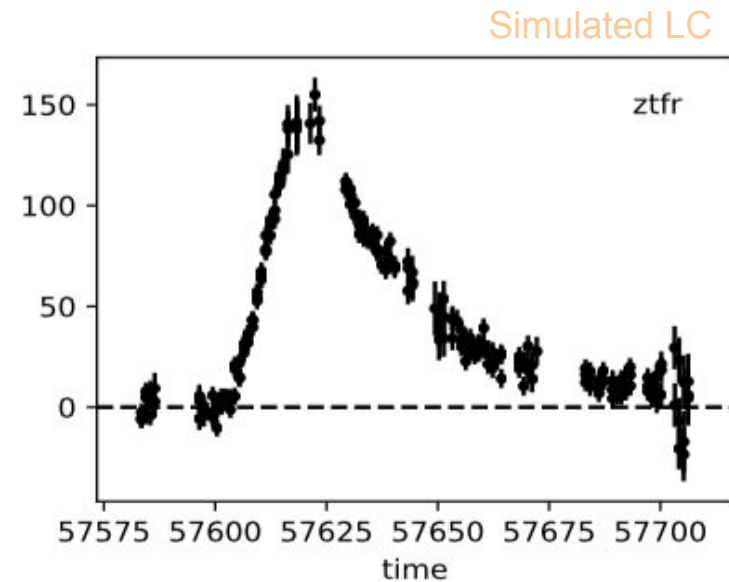

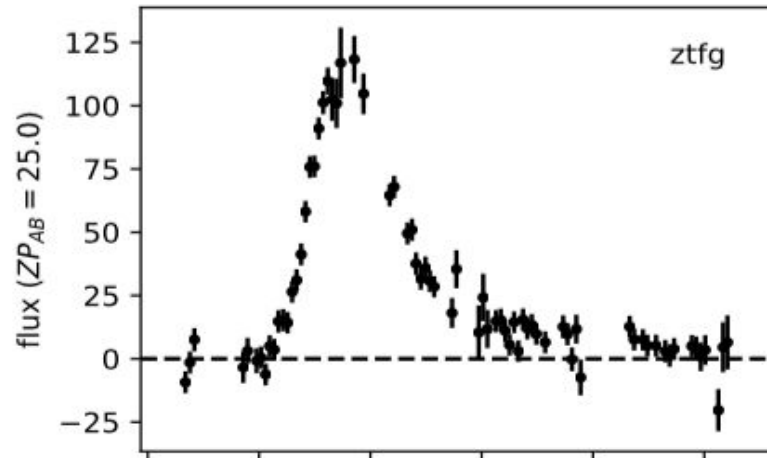

ZTF | SNe Ia Light Curve Expectation

$z=0.05$

ZTF | SNe Ia Light Curve Expectation

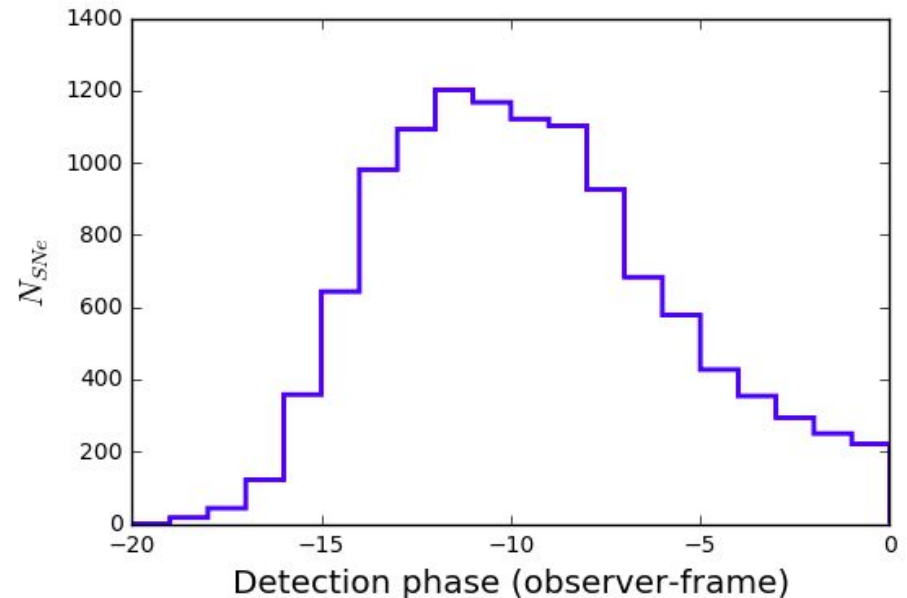

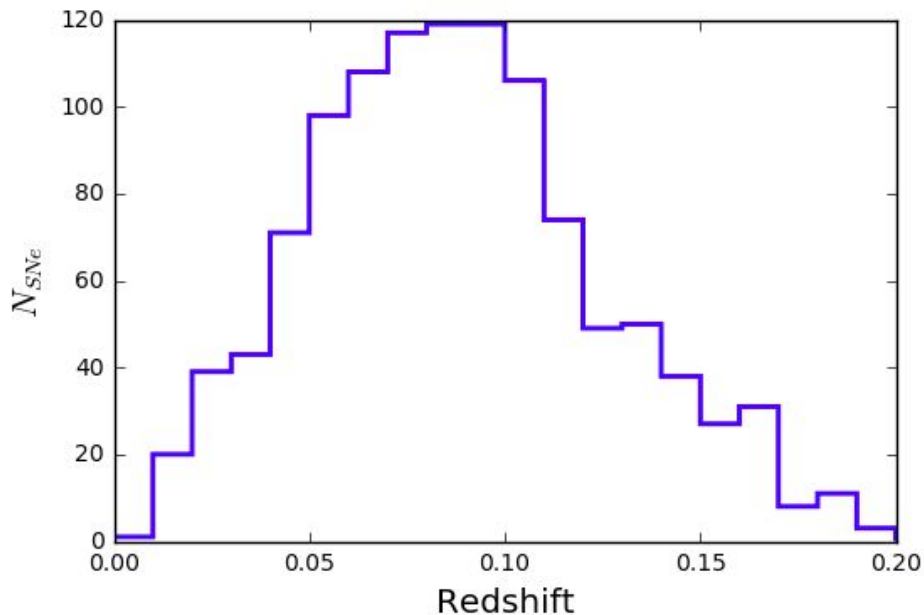

$z=0.08$

Building the Low redshift sample

Simulated plot

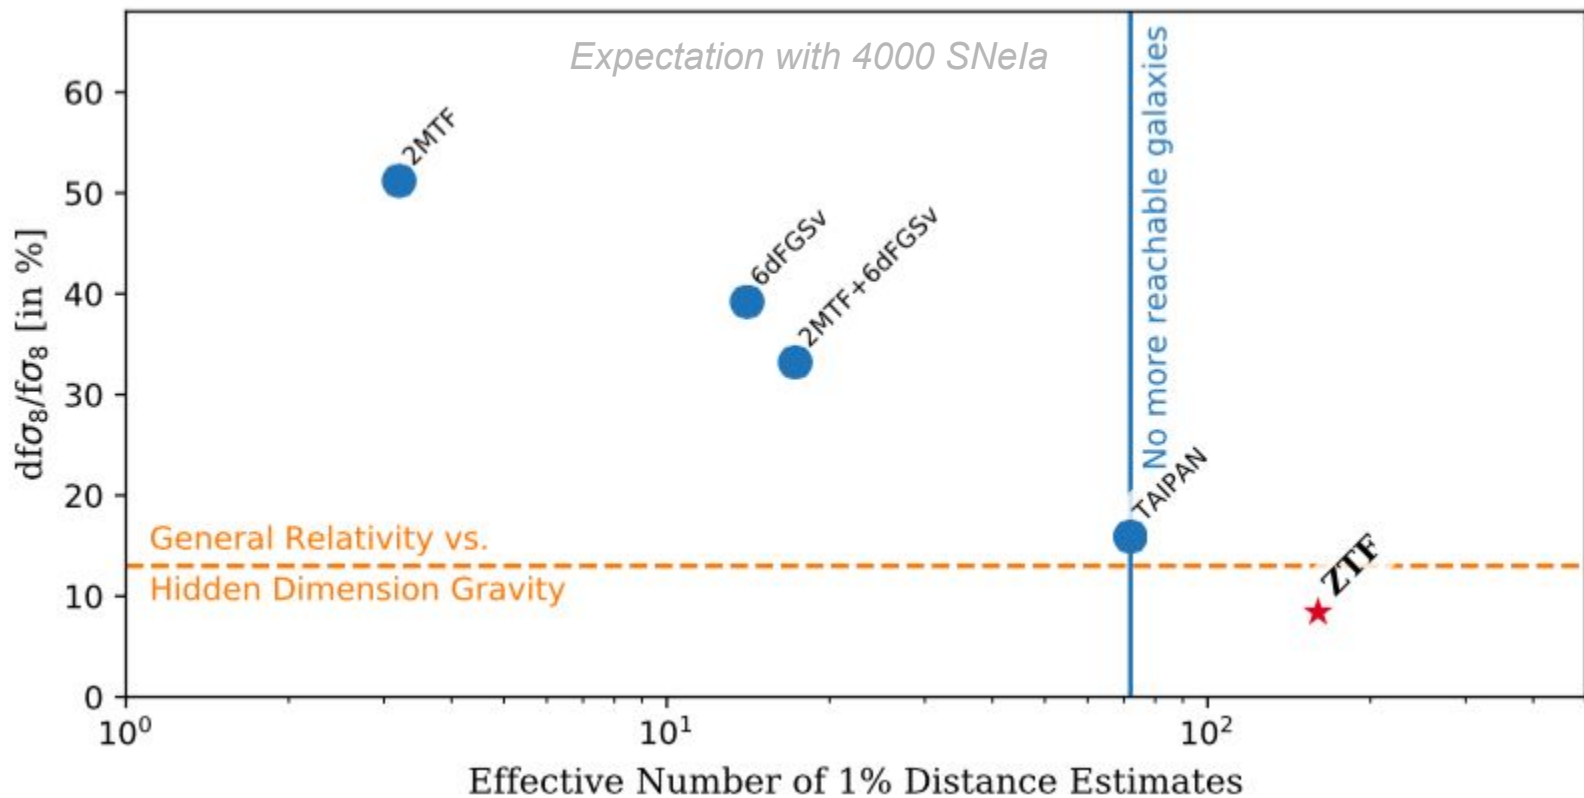

~2000 in 3 year with 3 bands (more than >10 points / band) with $z < 0.1$

Aim at 1% photometry

All SNe Ia will be spectroscopically typed

New era for Accurate Cosmology with nearby SNe Ia

Subaru | Subaru Strategic Program (SSP)

a.k.a. Subaru Supernova Survey
SuSHI

- Subaru / HyperSuprimeCam

- Télescope de 8.2-m, caméra 1.8 deg^2
- 104 + 8 red-sensitive CCDs

- Subaru Strategic Program

- 300 nuits
- 3 layers (Wide, Deep, Ultra-Deep)
- Recadencage Ultra-DEEP
- Survey SN ultra-profond (2 x 6 mois)

- 240 SNe Ia

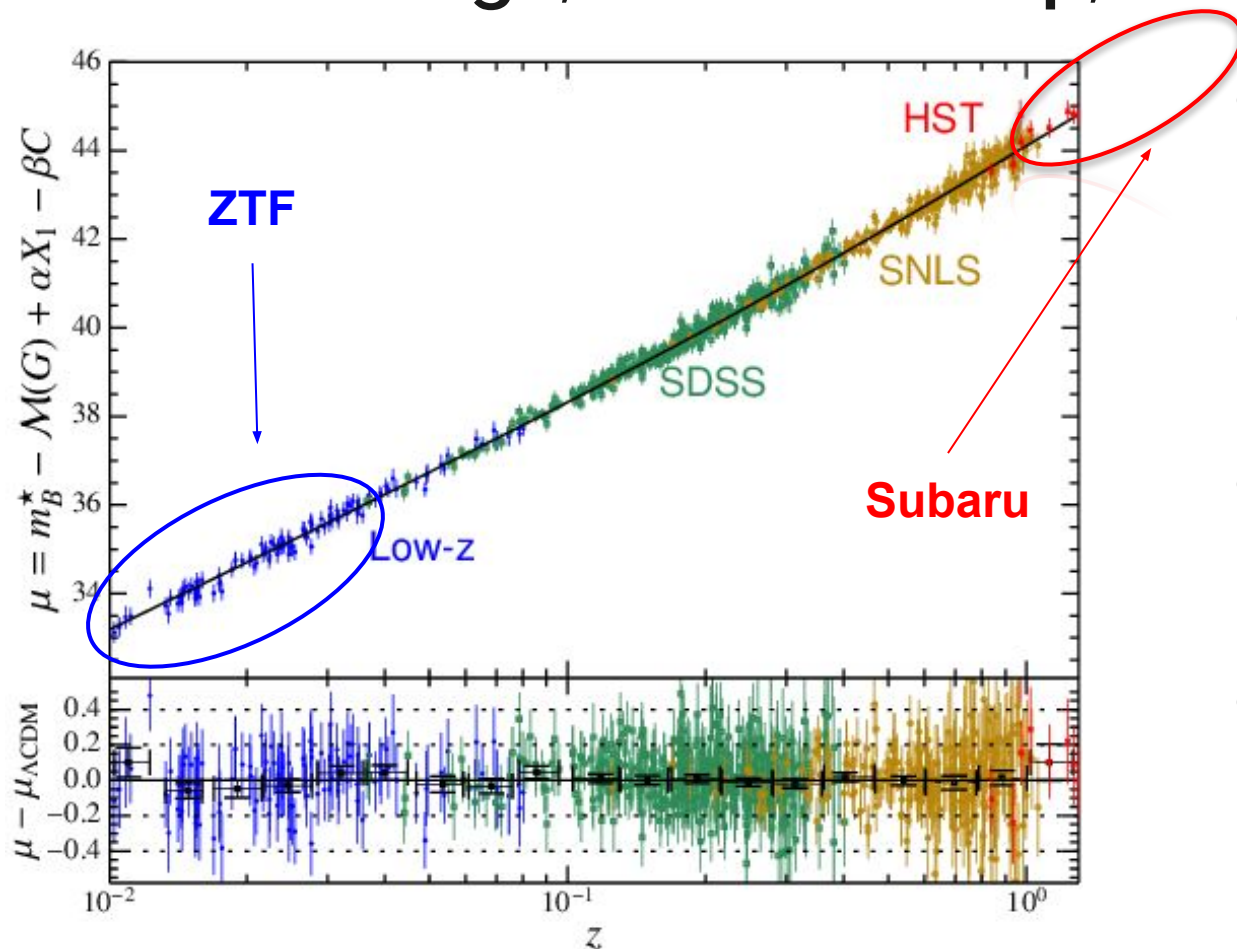

- 80 @ $z < 0.8$
- 80 @ $0.8 < z < 1.2$
- 80 @ $1.2 < z < 1.5$

*Good training for
LSST*

*IR observations
(Hubble Space Telescope)*

ZTF is large, Subaru is deep, LSST is both

- **Goals**

- Extend the redshift lever-arm
- Combination paper by 2020
- FoM > 50 by 2020

- **Maintain / upgrade expertise in**

- SN photometry
- Flux metrology

- **Explore analysis strategies -> LSST**

- SN LC models
- Malmquist bias
- Combined fits (cosmo + LC models)

- **Demonstrate ground / space complementarity**

- HST / Subaru

Project structure

Spectro

VLT

Gemini

Subaru

Keck

IPMU, LPNHE,
STScI, LBNL

*Detection &
follow-up*

**Subaru/HSC
(SSP)**

**Rolling search
2 x 6 months**

IPMU, LPNHE

IR follow-up

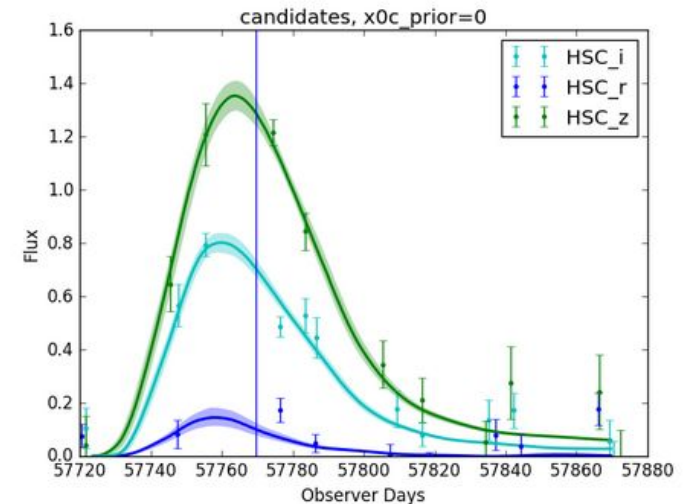

**HST/WFC3
100 orbits**

IPMU, STScI,
LBNL, LPNHE 14

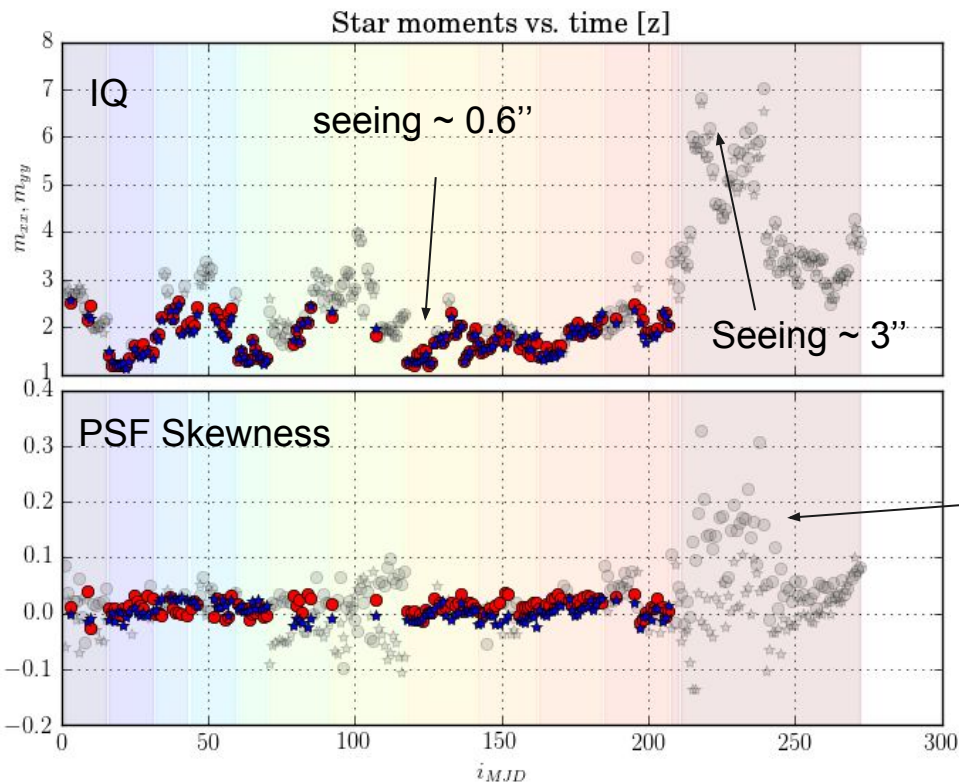

Status of the Project

- Data taking started in Dec. 2016
 - 6 month search
 - COSMOS field (SNLS-D2)
 - O(1000) transients
 - O(200) SNe Ia
 - O(100) SNe Ia @ $z < 1.1$
 - HST triggered on 25 $z > 1$ SNe -> ~ 50% final statistics
- Data taking restarted in Jan. 2018
 - 5 month search (bad weather in Dec 2017)
 - COSMOS field again (enables deep references)
- Third season possible (XMM field)
 - August 2018 -> Jan 2019
 - $z < 1.1$ (no HST)

2 $z > 1.1$ SNe sent to HST

Data quality

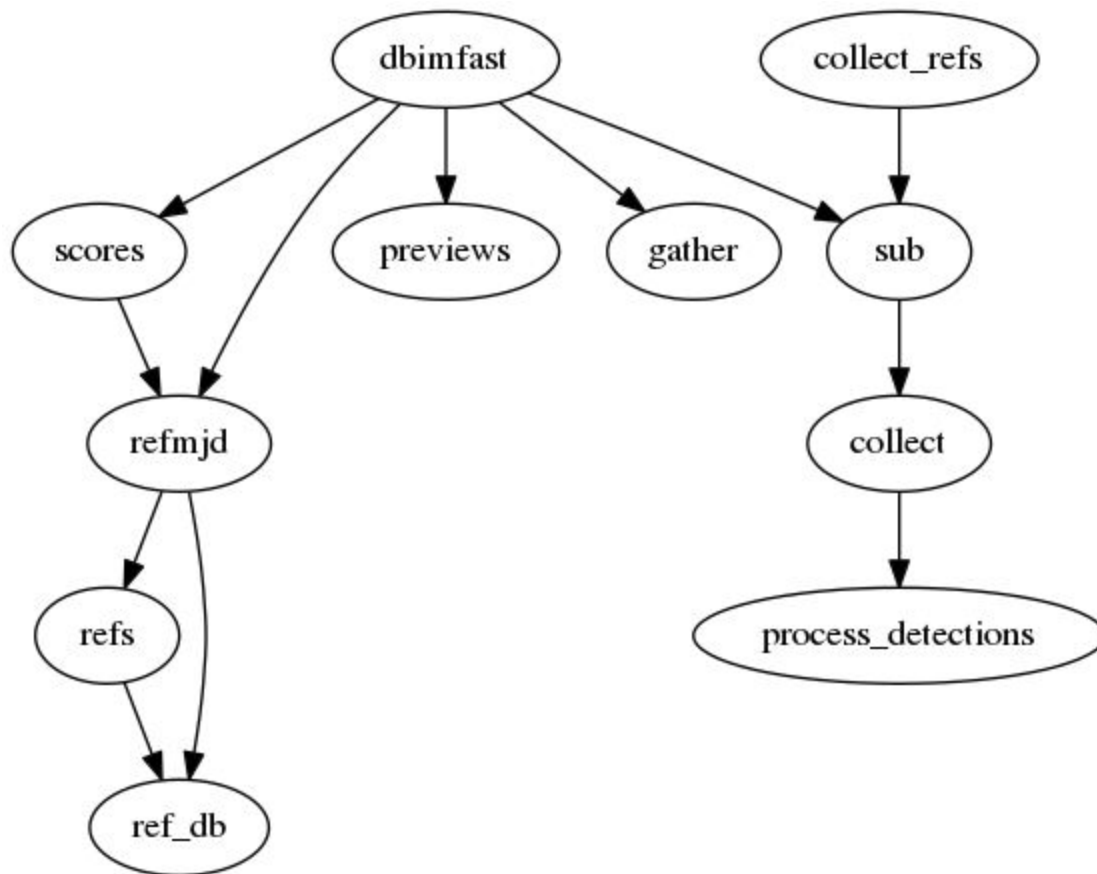

- Great instrument
- Data quality is good

... but

- COSMOS is a winter field
 - Variable IQ (median seeing ~ 0.8)
 - Some exposures with PSF globally skewed

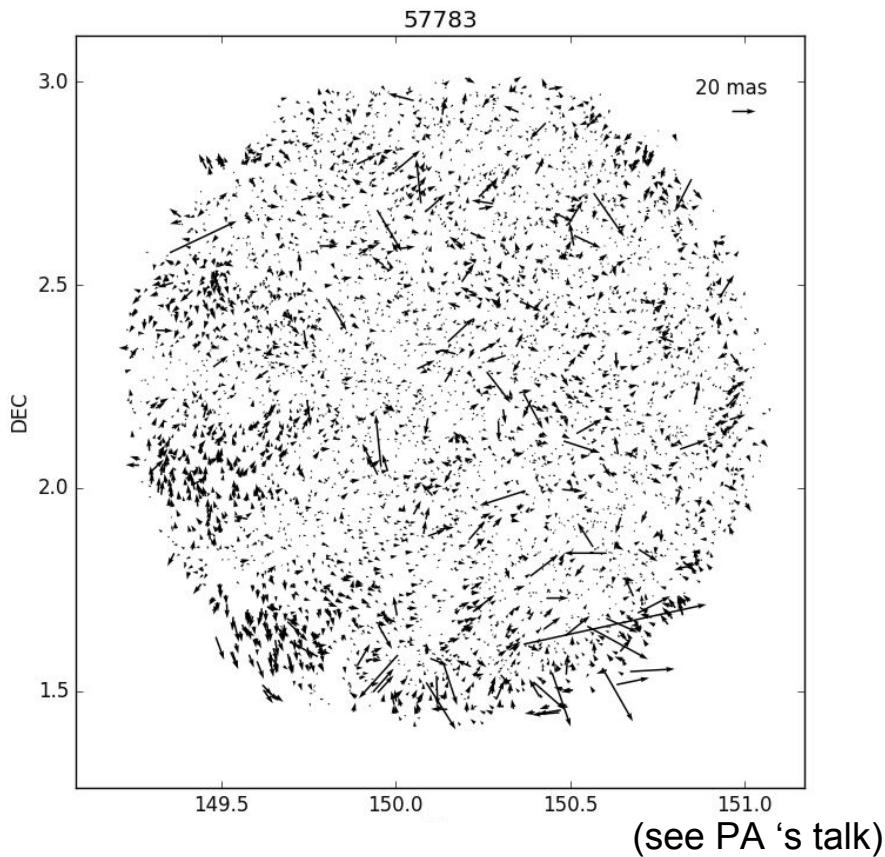

Detection & Photometry pipelines

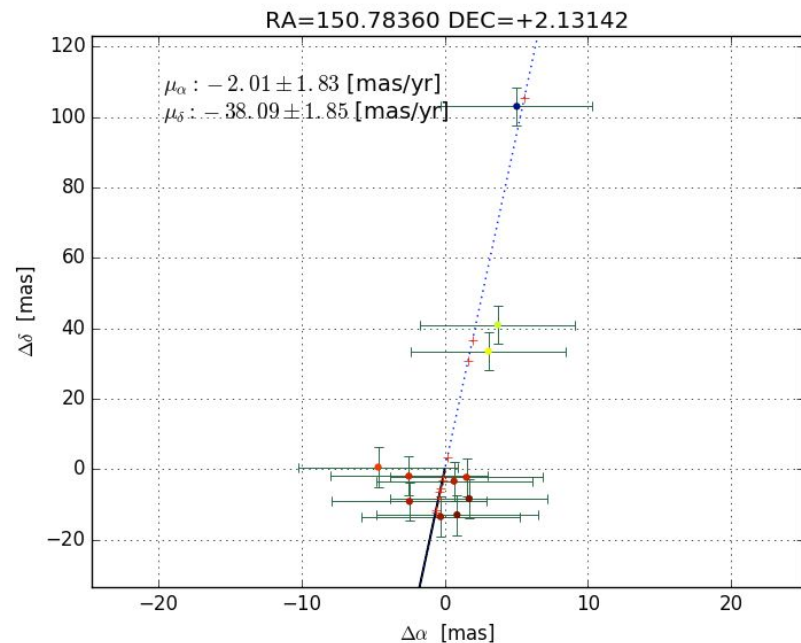

- **In construction**
 - Adapted from SNLS pipeline
 - With recent additions (e.g. jointcal)
 - Very light and flexible pipeline infrastructure (pipelet)
- **A few more man-months worth of work before we can deliver SNLS-grade lightcurves**
- **Developments on**
 - Astrometry
 - Photometric uniformity
 - PSF model
 - Relative astrometry
 - Scene modeling fit

(+ pipeline / scanning infrastructure)

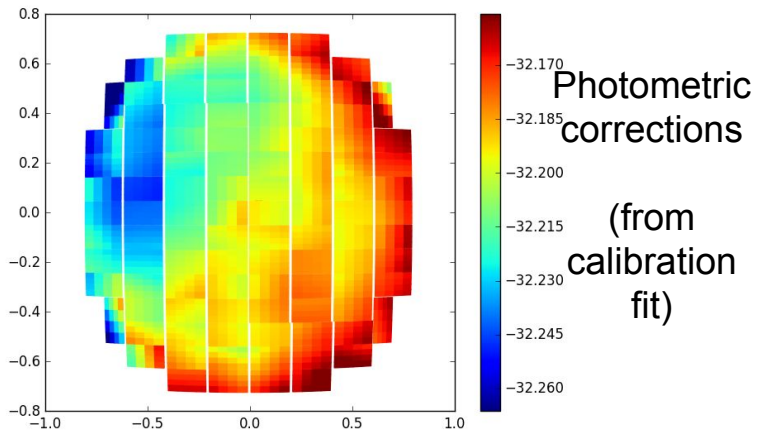

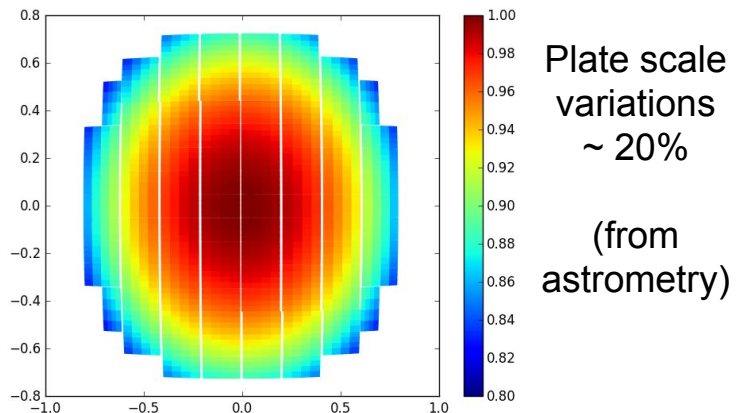

Ongoing work | astrometry

- Based on gastro/jointcal
 - Astrometric precision ~ 5 mas
 - Additional developpements pending
 - Proper motions in the global fit
 - Combined fit of several epchs

Ongoing work | Photometry / calibration

- Same technique : fit for
 - Stars
 - Photometric flats
 - ... from dithered exposures
 - ... using an external calibration catalog
 - to anchor the flux scale
 - In developpement:
 - Understand residuals (passbands ?)
 - Better parametrization of instrument response variations
 - Simultaneous fit of all epochs
- SNLS (as of today)

Perspectives / Forecasts

Dataset	FoM (JLA calibration)	FoM (calib uncertainties halved)
JLA	15	21
JLA + SSP	37	48
JLA + SSP + ZTF	56	69
JLA + SSP + ZTF + DES	~70	~86

ZTF is large, Subaru is deep, LSST is both

LSST has to be an IN2P3 joined effort, not a lab-oriented activity

FoM (fixed filter position)

We compute the FoM from the covariance matrix for 2×10^4 SNe Ia :

Backup | ZTF

e2v	
dimension	9.2 x 9.2 cm
pixels	6.1k x 6.1k
pixel size	15 micron
pixel scale	1"/pixel
outputs	4
