## Toward Room Temperature Superconductivity in high-pressure hydrides

The discovery of “almost room temperature” superconductivity in a high-pressure hydride, LaH<sub>10</sub>, [1] is a spectacular demonstration of a new approach to search for superconductors, which combines high pressures, computational methods for crystal structure prediction and superconductivity. [2]

In my talk, I will review the current theoretical understanding of the field of superconductivity in high-pressure hydrides and propose possible strategies to improve the superconducting properties. [3]
