## INTRODUCTION TO MACHINE LEARNING

#### Vincent Barra

LIMOS, UMR 6158 CNRS, Clermont-Auvergne University, Clermont-Fd, FRANCE

May 29, 2018

WHAT IS MACHINE LEARNING

## WHAT IS MACHINE LEARNING

#### Webster's definition of "to learn"

"Gain knowledge or understanding of, or skill in by study, instruction or experience"

- $\rightarrow$  Learning a set of new facts
- ightarrow Learning HOW to do something
- ightarrow Improving ability of something already learned

#### "Machine Learning"

- Simon<sup>1</sup>: "Learning denotes changes in the system that are adaptive in the sense that they enable the system to do the same task or tasks drawn from the same population more effectively the next time"
- $\circ\,$  Michalski  $^2$  : "Learning is constructing or modifying representations of what is being experienced "
- Mitchell<sup>3</sup>: "A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P if its performance at tasks in T, as measured by P improves with experience E"

(1)Simon M- Machine Learning I, 1993, Chapter 2

(2)Michalski R, Carbonell J, Mitchell T (Eds), Machine Learning: An Artificial Intelligence Approach, Morgan Kaufmann, 1986 (3)Mitchell T, Machine Learning, Chapter 1: Introduction, pp. 1-19, McGraw Hill, 1997.

MAIN CHALLENGES OF ML

CONCLUSION

## WHY LEARNING ?

Machine learning is programming computers to optimize a performance criterion using example data or past experience.

#### Learning is used when

 $\rightarrow$ Human expertise does not exist  $\rightarrow$   $\rightarrow$   $\rightarrow$   $\rightarrow$   $\rightarrow$   $\rightarrow$  $\rightarrow$

## A SIMPLE EXAMPLE

"A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P if its performance at tasks in T, as measured by P, improves with experience E"

Build a program that learns to detect spams, based on annotated emails

#### Spam detection

- T detect spams
- E: annotated emails (spams / no spams)
- P: proportion of emails correctly classified

CONCLUSION

## A SIMPLE EXAMPLE

"A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P if its performance at tasks in T, as measured by P, improves with experience E"

Build a program that learns to detect spams, based on annotated emails

#### Spam detection

- T detect spams
- E: annotated emails (spams / no spams)
- P: proportion of emails correctly classified

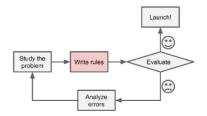

#### **Traditional approach**

- o observe what a spam looks like (frequency of some words, senders,...)
- write a algorithm detecting these patterns
- o consider an email as a spam if some patterns are detected
- test and iterate until P is satisfied

CONCLUSION

INTRODUCTION 00000 TAXONOMY  MAIN CHALLENGES OF ML

CONCLUSION

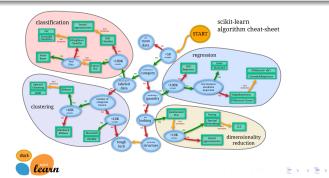

3

## TAXONOMY

#### Several criteria

- trained or not: supervised vs unsupervised vs semi-supervised vs reinforcement learning
- trained gradually with the data or not: online vs batch
- based on known examples or built predictive models: instance-based vs model-based.
- > objective: regression vs. classification

Non exhaustive and combinable.

CONCLUSION

#### EMPIRICAL RISK MINIMIZATION (ERM)

Find  $f \in \mathcal{F}$  ( $f_{emp}$ ) minimizing  $R_{emp}$  (f)

 $R(f_{emp}) = R(f_{Bayes}) + (R(f_{opt}) - R(f_{Bayes})) + (R(f_{emp}) - R(f_{opt}))$ 

INTRODUCTION DIFFERENT TYPES OF ML SUPERVISED/UNSUPERVISED/REINFORCEMENT

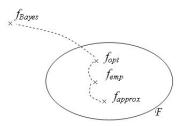

MAIN CHALLENGES OF ML

CONCLUSION

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

### SUPERVISED LEARNING FROM A STATISTICAL POINT OF VIEW

In practice, impossible to compute  $f_{emp}$  in reasonable time  $\Rightarrow f_{approx} \approx f_{emp}$ .

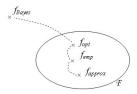

SUPERVISED/UNSUPERVISED/REINFORCEMENT

### SUPERVISED LEARNING FROM A STATISTICAL POINT OF VIEW

At least 3 reasons hinder the results of a ML algorithm:

- weak expressivity of  $\mathcal{F}$ : structural error;
- Unconsistency or the ERM principle : do we get close to fopt with the training set (and its number of examples)?
- Difficulty to minimize the empirical risk.

BATCH / INLINE LEARNING

# INLINE LEARNING

### Learning rate

How fast an inline ML algorithm has to adapt to new data (and then forget the older ones) ?

- $\Rightarrow$  Define a learning rate:
  - too fast: unstable system, too sensitive to erroneous data
  - too slow: the algorithm will not be able to adapt

MAIN CHALLENGES OF ML

CONCLUSION

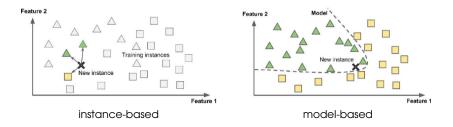

WITH / WITHOUT A MODEL

# GENERALIZATION

### Generalization

Capacity of an algorithm to correctly predict on new data. Two main approaches:

- instance-based (without a model)
- model-based

▲□▶▲□▶▲□▶▲□▶ □ のQ@

# EXAMPLE

Simple example: construction of a model on simple data

### Data

- "Better life" data, OCDE
- income distribution by country and subjective feelings (happyness)

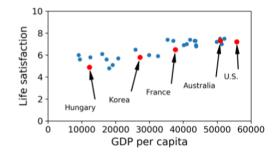

Country	Income (USD)	Happyness
Hungary	12240	4.9
South Korea	27195	5.8
France	37675	6.5
Australia	50962	7.3
U.S.	55805	7.2

Can money buy happyness?

CONCLUSION

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

# EXAMPLE

Any tendancy ?

CONCLUSION

◆□ > ◆□ > ◆豆 > ◆豆 > ̄豆 \_ のへで

# EXAMPLE

### 

happyness =  $\theta_0 + \theta_1$  income

# EXAMPLE

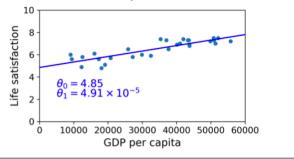

### **Optimal parameter values**

Optimal in the sens of a performance measure

- > utility function: measures to which extent the model performs well
- cost function: measures to which extent the model is bad

### Linear regression case

In general: cost function measuring the distance between predictions and real values on the training set.

MAIN CHALLENGES OF ML

CONCLUSION

▲ロ▶ ▲冊▶ ▲ヨ▶ ▲ヨ▶ ヨ のなべ

# MAIN CHALLENGES OF ML

Two main problems:

- A wrong algorithm
- bad, missing, noisy and/or too few data

NTRODUCTION DIFFERENT TYPES OF ML

MAIN CHALLENGES OF ML

CONCLUSION

▲□▶▲□▶▲□▶▲□▶ □ のQ@

### PROBLEMS WITH DATA

# TOO FEW DATA

### The child

To learn what an apple is, only have to show (and repeat) an apple, and pronounce the word. The child is then able to recognize all varieties of apples, whatever the shape and color

### The machine

A lot of data is necessary to learn the concept. Even for simple problems, thousands of examples needed.

 CONCLUSION

#### PROBLEMS WITH DATA

## TOO FEW DATA

For best performances: simple (and even naive) algorithm and huge amount of data.

Example: performance of simple algorithms on a difficult problem (desambiguation of "too", "two" or "to")

# **OVERFITTING**

### Overfitting

The algorithm fits very well the training set but behaves poorly on generalization

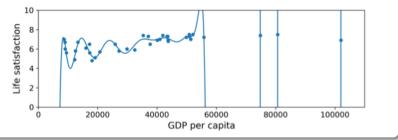

CONCLUSION

#### PROBLEMS WITH ALGORITHMS

# OVERFITTING

### Overfitting

The algorithm fits very well the training set but behaves poorly on generalization

### Why?

Model too complex w.r.t. noise level and.or number of data

- simplify the model
- use more data
- reduce the amount of noise in the data

MAIN CHALLENGES OF ML

CONCLUSION

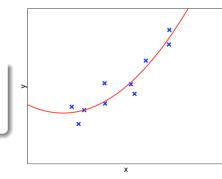

#### PROBLEMS WITH ALGORITHMS

# **OVERFITTING**

### A visual example of overfitting

Polynomial interpolation of a set of points

#### PROBLEMS WITH ALGORITHMS

# REGULARIZATION

### Definition

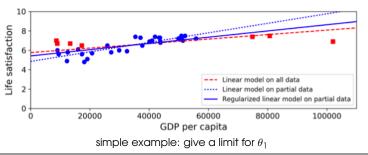

CONCLUSION

#### PROBLEMS WITH ALGORITHMS

# REGULARIZATION

### Definition

#### Constrain the model to simplify it.

### Hyperparameter

The quantity of regularization is controled by an hyperparameter (learning parameter)

- a prori fixed during the training phase
- the higher the hyperparameter, the more constrained the model will be
- hyperparameter(s) need(s) to be tuned (important issue)

 CONCLUSION

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

#### PROBLEMS WITH ALGORITHMS

# UNDERFITTING

## Definition

The model is too simple:

- choose a more complex model (with more parameters)
- find better attributes
- lower the regularization

 CONCLUSION

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三■ - のへぐ

TEST AND VALIDATION

# Once the model is learned, one has to evaluate it and if necessary tune it. Training/test sets

The only way to see if the model generalizes well is to test it on new data

- $\blacktriangleright$  A subset of the initial set ( $\approx 80\%$  )will serve as a learning set  $\rightarrow$  training error
- the rest will serve as a test set  $\rightarrow$  generalization error

 CONCLUSION

### TEST AND VALIDATION

TEST SET

Once the model is learned, one has to evaluate it and if necessary tune it. **Training/test sets** 

The only way to see if the model generalizes well is to test it on new data

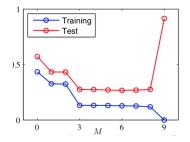

- A subset of the initial set (pprox 80% ) will serve as a learning set ightarrow training error
- $\blacktriangleright$  the rest will serve as a test set  $\rightarrow$  generalization error

### Overfitting

generalization error> training error  $\Rightarrow$  Overfitting

### TEST AND VALIDATION TEST SET

- > The training error decreases with the complexity of the model
- > The generalization error decreases at first, then starts increasing
- As we will see, cross-validation will help:
  - Find a good model, using a validation set
  - Report unbiased results, using a test set, untouched during either parameter training or validation

#### TEST AND VALIDATION

# VALIDATION SET

## Hyperparameter tuning

When comparing several models (using different values for the hyperparameter(s)) on the test set, this test will be "learned"

### Learning/Validation sets

Learning set / Validation set The models are tested on the validation set, the best is retained. Then this model is applied on the test set to evaluate it.

 CONCLUSION

▲□▶▲□▶▲□▶▲□▶ □ のQ@

#### TEST AND VALIDATION

# **CROSS VALIDATION**

Risk: learn the validation set

### Principle

- divide the learning set in v subsets
- learn the modl with v 1 subsets
- test using the last subset
- repeat v times, using each of the v subsets as a test set

Final error: mean of the v learning errors

 $\begin{array}{c} \text{Main challenges of ML} \\ \texttt{OOOOOOOOOOOOOOOO} \end{array}$

TEST AND VALIDATION

## PERFORMANCE MEASURE

Measuring the performance of a classifier is generally harder than for a regression algorithm.

- cross validation (can be difficult if the classes are non equilibrated)
- confusion matrix (binary and multiclass cases)

#### TEST AND VALIDATION

# PERFORMANCE MEASURE

$$C = \begin{pmatrix} C_{1,1} & C_{1,2} \\ C_{2,1} & C_{2,2} \end{pmatrix}$$

## Example: binary confusion matrix C

- $C_{1,1}$ : true positives (TP)
- ► C<sub>2,2</sub> : true negatives (TN)
- ► C<sub>1,2</sub> : false positives (FP)
- C<sub>2,1</sub> : true negatives (FN)

INTRODUCTION	DIFFERENT TYPES OF ML
00000	000000000000000000000000000000000000000

CONCLUSION

#### TEST AND VALIDATION

# PERFORMANCE MEASURE

$$C = \begin{pmatrix} C_{1,1} & C_{1,2} \\ C_{2,1} & C_{2,2} \end{pmatrix}$$

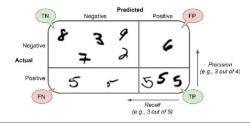

## Example: binary confusion matrix C

- $C_{1,1}$ : true positives (TP)
- ► C<sub>2,2</sub> : true negatives (TN)
- ► C<sub>1,2</sub> : false positives (FP)
- $C_{2,1}$  : true negatives (FN)

## Precision / Recall

• precision 
$$P = \frac{TP}{TP + FP}$$

• recall 
$$\frac{TP}{TP+FN}$$

#### TEST AND VALIDATION

## PERFORMANCE MEASURE

### $F_1$ score

$$F_1 = 2\frac{P.R}{P+R} = \frac{TP}{TP + \frac{FN + FP}{2}}$$

## Harmonic mean

Good performances for classifiers with similar P and R values

INTRODUCTION	DIFFERENT TYPES OF ML
00000	000000000000000000000000000000000000000

CONCLUSION

TEST AND VALIDATION

## **PERFORMANCE MEASURE**

 $F_1$  score

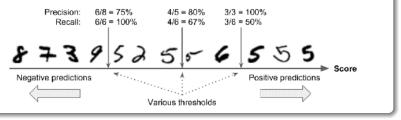

$$F_1 = 2\frac{P.R}{P+R} = \frac{TP}{TP + \frac{FN + FP}{2}}$$

### Harmonic mean

Good performances for classifiers with similar P and R values

### P/R compromise

- ► In general, improving *P* lowers *R* and vice versa.
- > Decision function, returning a value compared to a threshold

 CONCLUSION

#### TEST AND VALIDATION

## PERFORMANCE MEASURE

ROC (Receiver Operating Characteristic): TP rate vs. FP rate
