

AGATA Detector Library

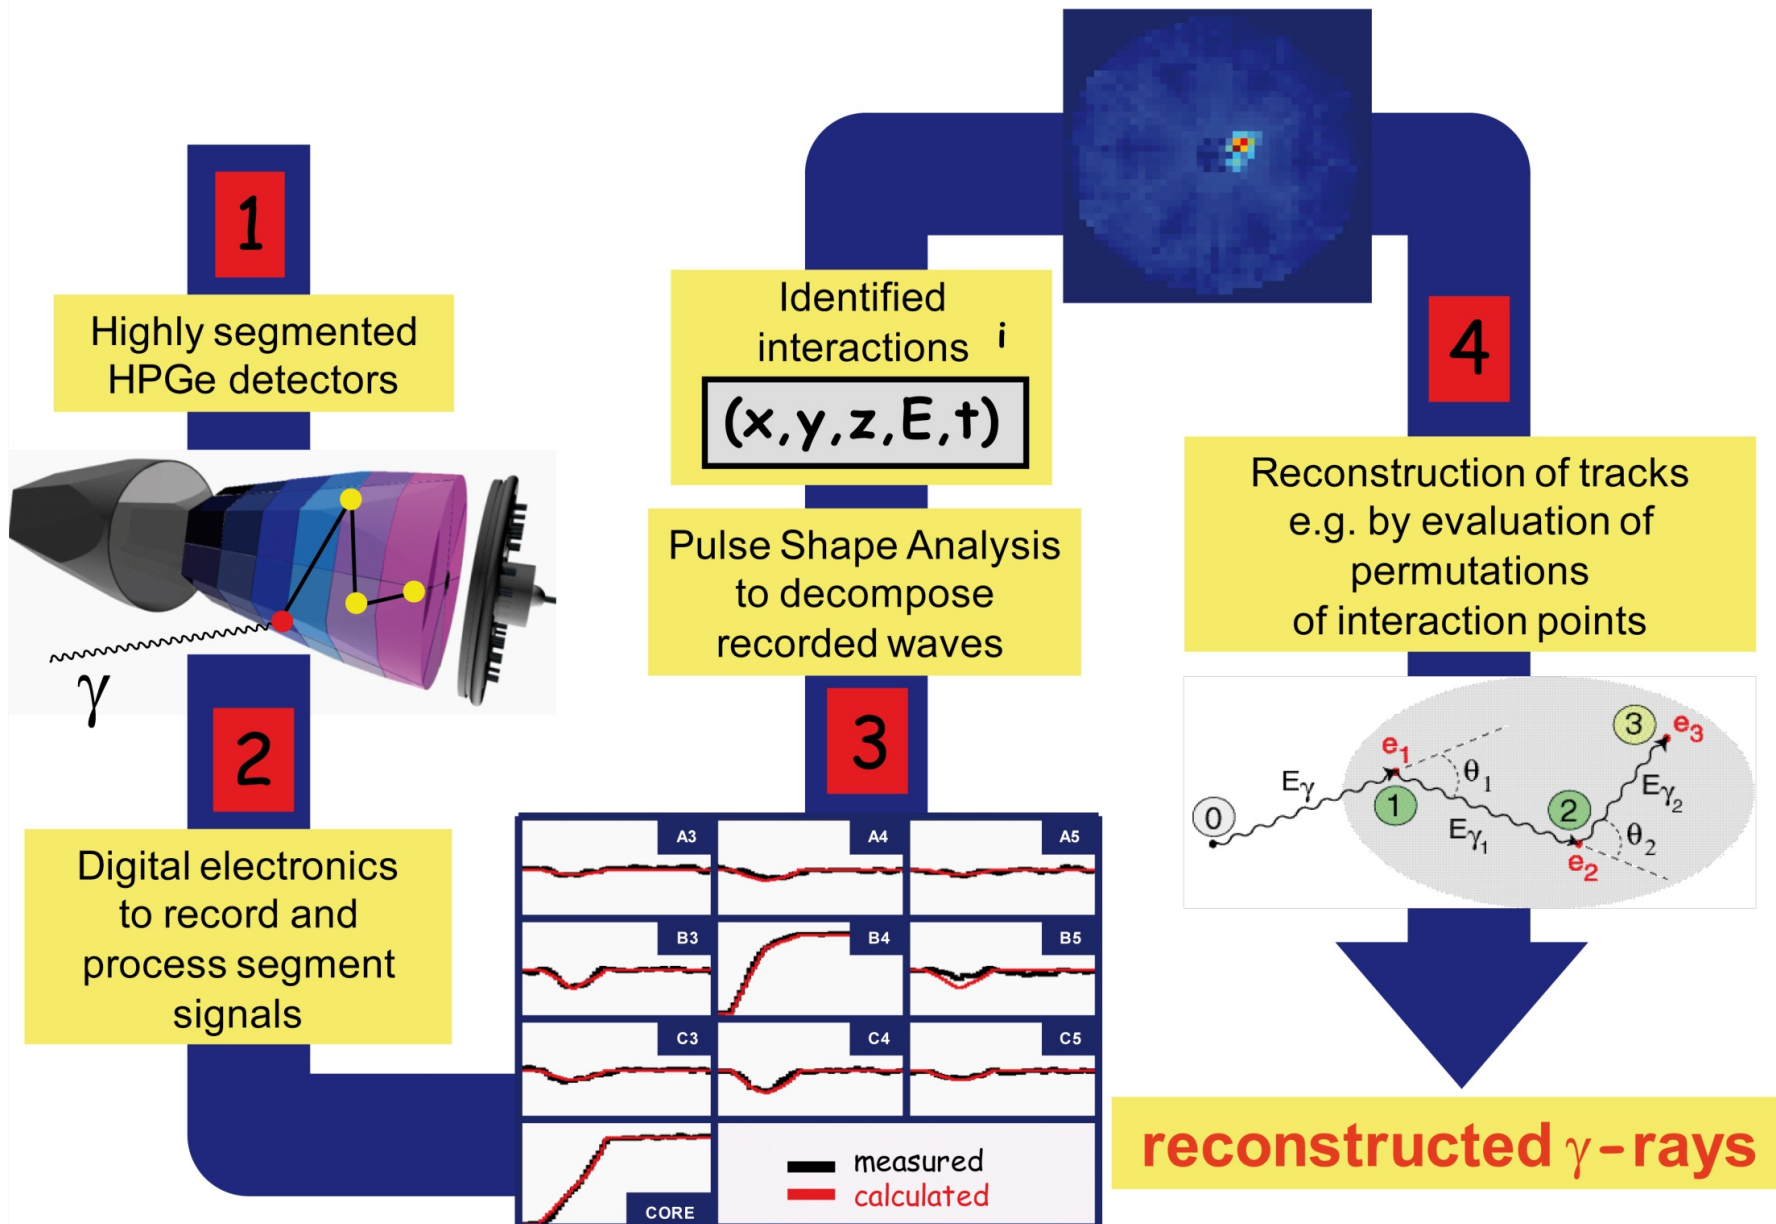

Second AGATA-GRETINA tracking arrays collaboration meeting

R. Hirsch, B. Birkenbach, B. Bruyneel, L. Lewandowski, P. Reiter
IKP, Universität zu Köln

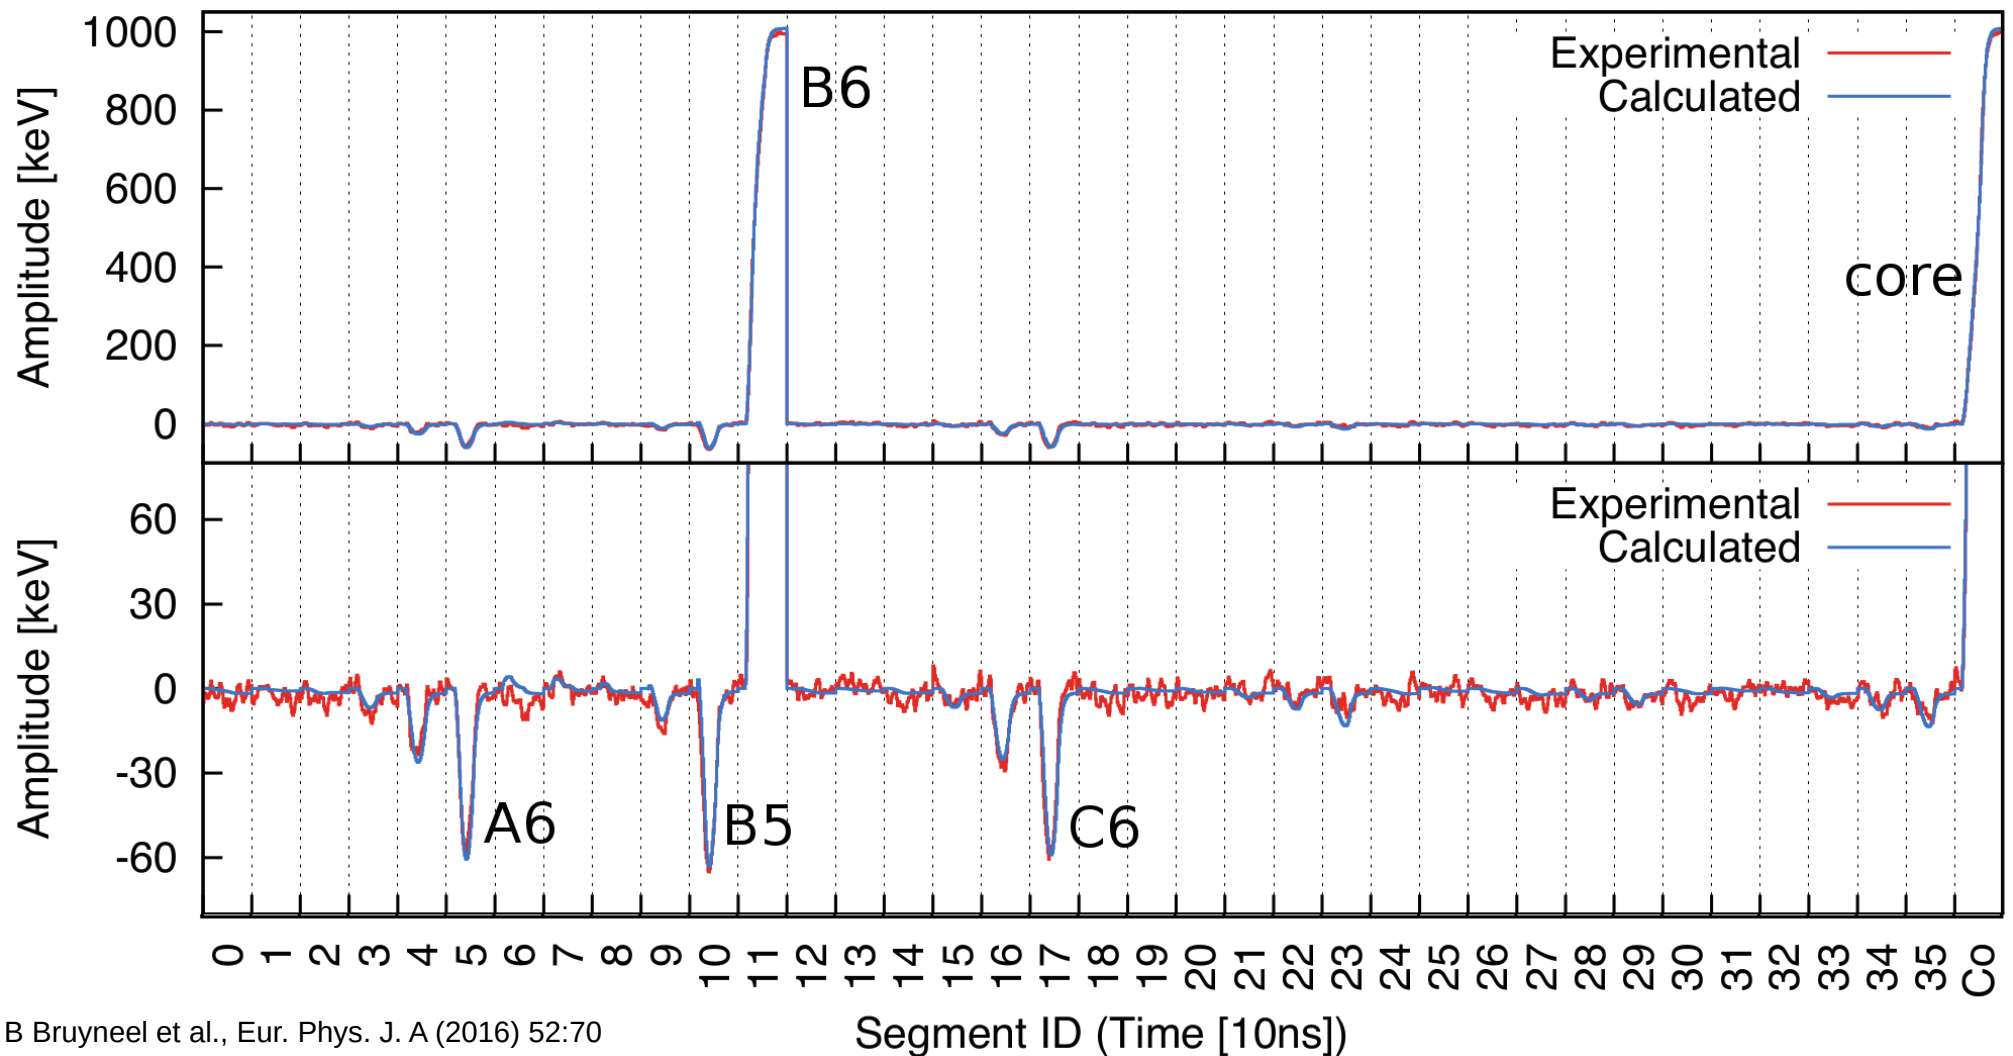

04.04.2018

Components of γ -ray tracking

Pulse-shape analysis

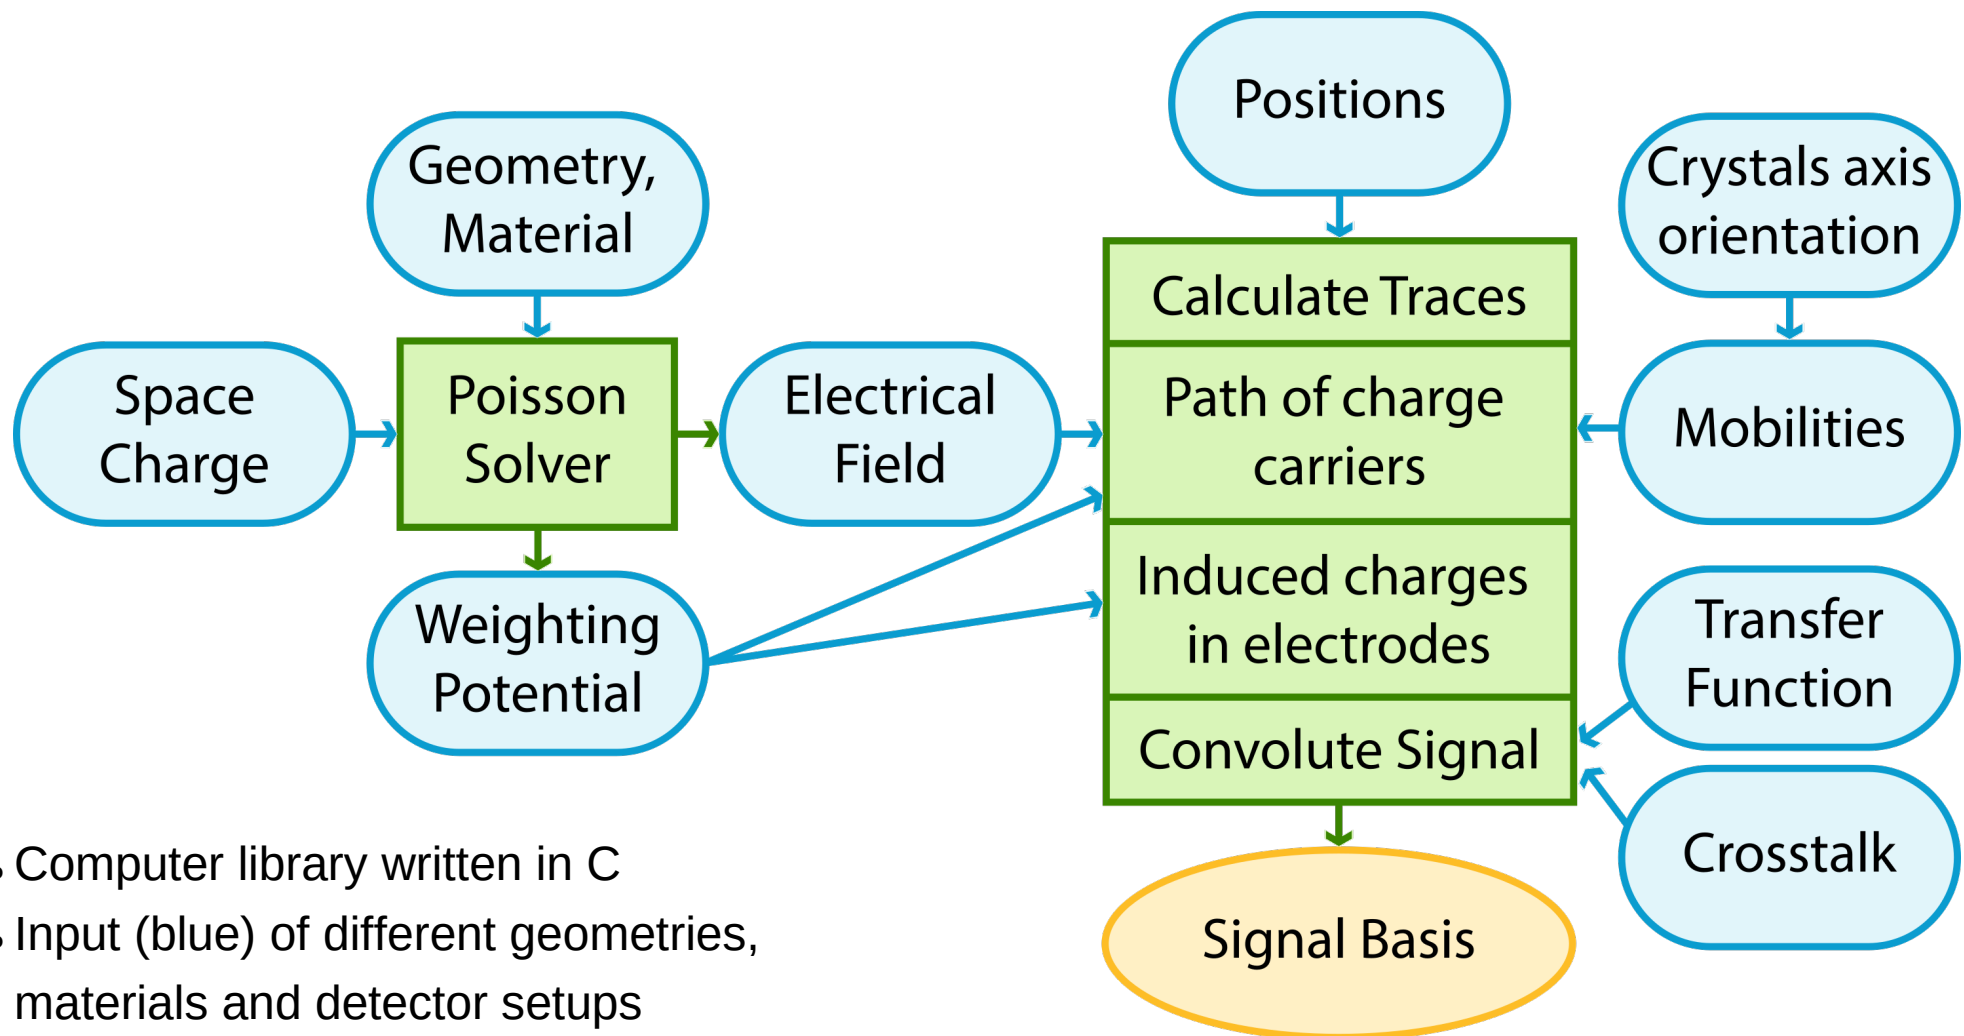

B Bruyneel et al., Eur. Phys. J. A (2016) 52:70

Database of signals with known interaction position

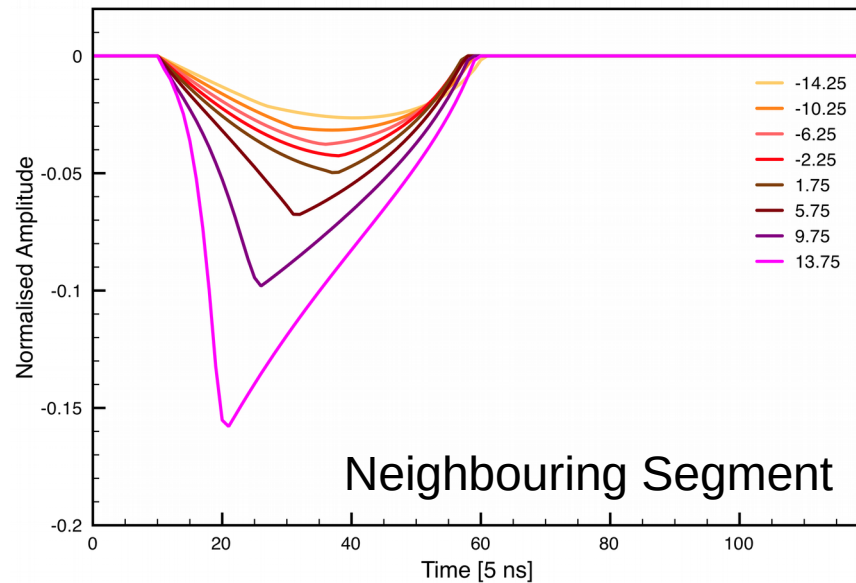

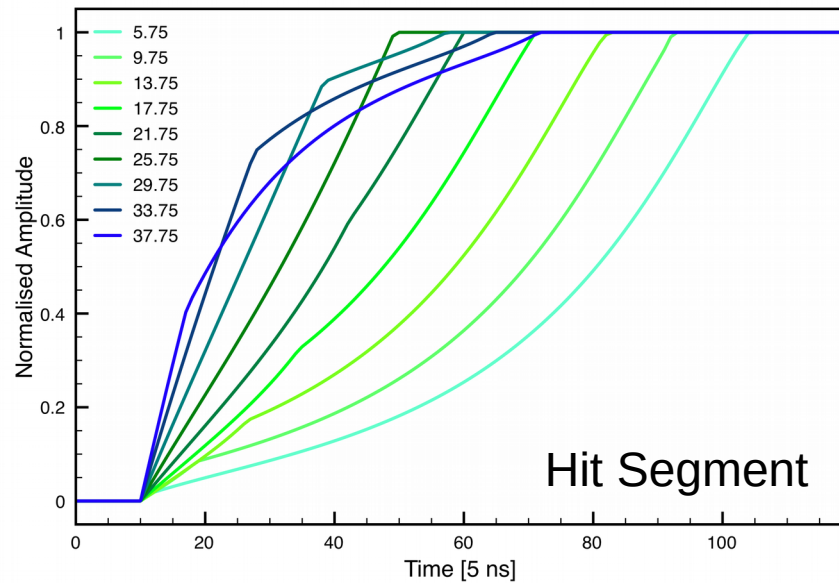

- Grid of interaction points
- Comparison of measured and data base signals
- Simulated database with ADL

The AGATA Detector Library

- Computer library written in C
- Input (blue) of different geometries, materials and detector setups
- Easy to extend by additional routines (green)

Signal basis

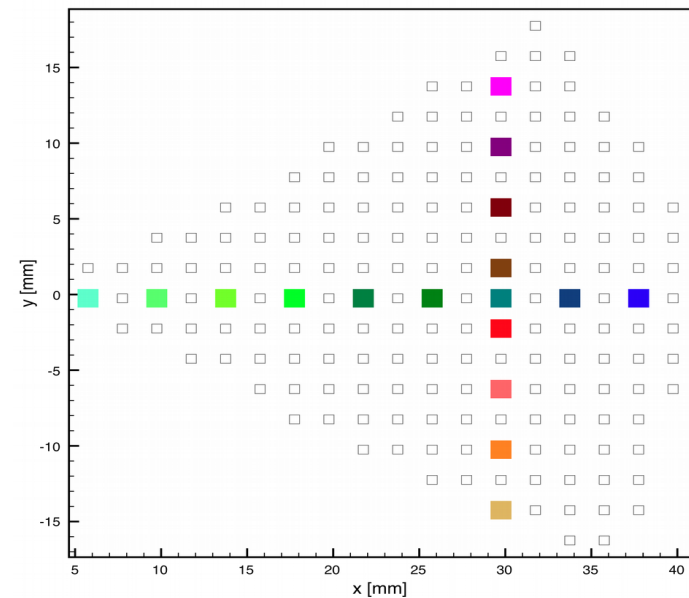

Only dependent on crystal properties:

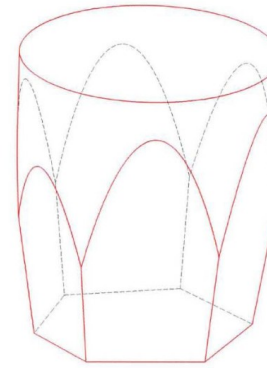

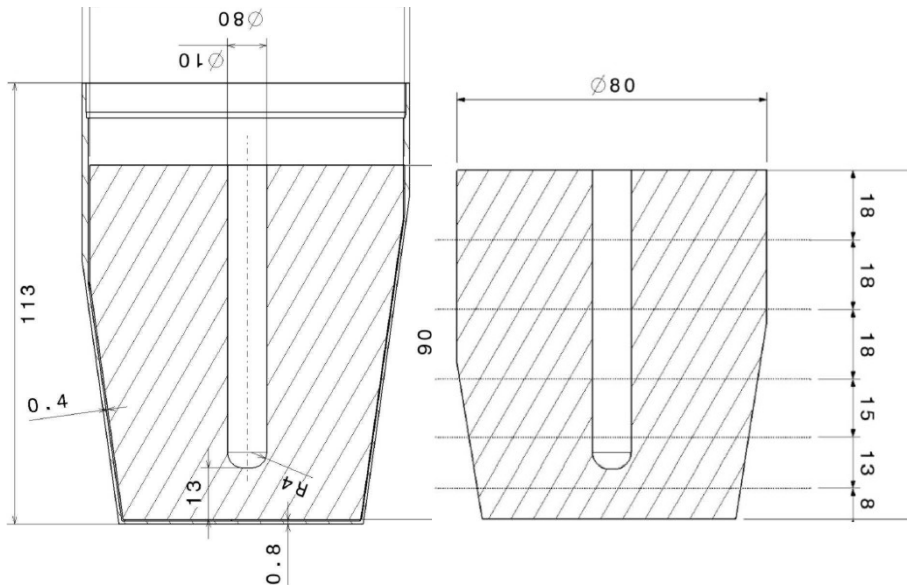

- Shape
- Crystal axis orientation
- Impurity concentration

No signal convolution:

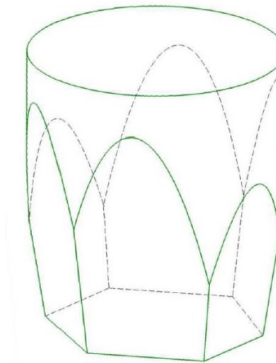

- Crosstalk
- Transfer function

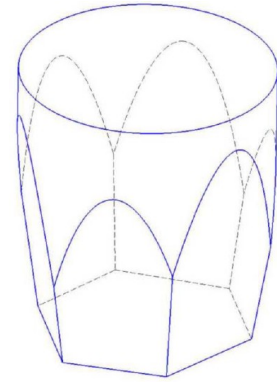

Weighting potentials

A - red

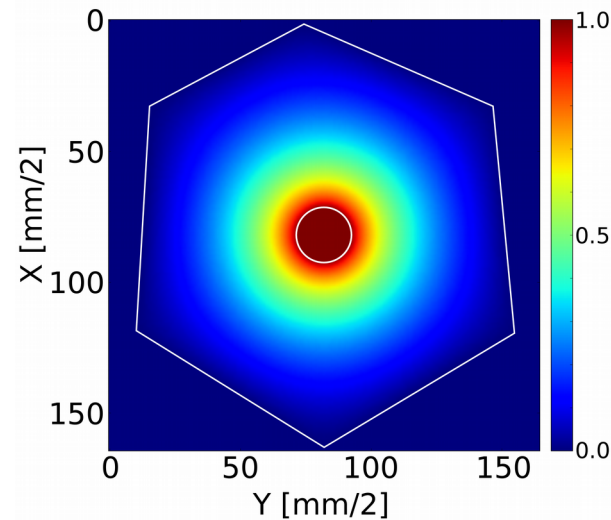

B - green

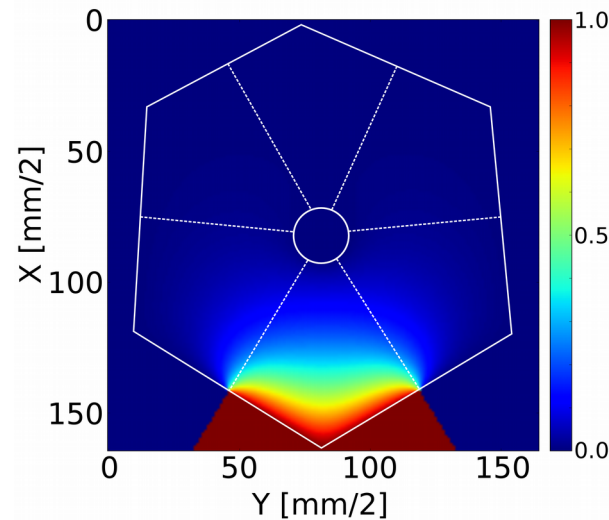

C - blue

Core

Segment

Weighting potentials

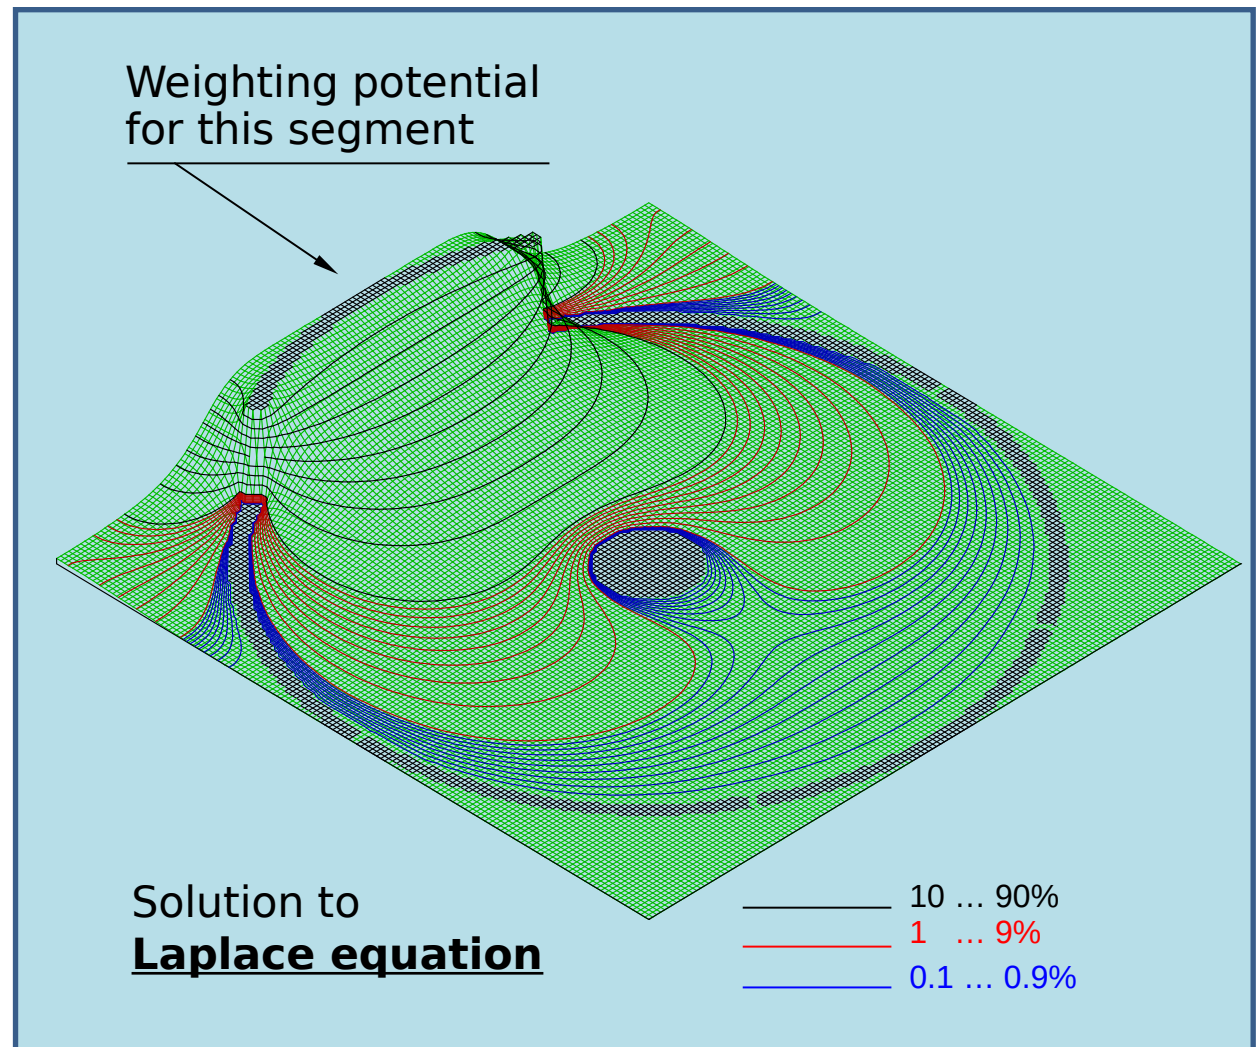

- Geometry dependent
- Cubic grid (SIMION format)
- Numerical solution
- Independent of space charge

Induced charges in electrodes

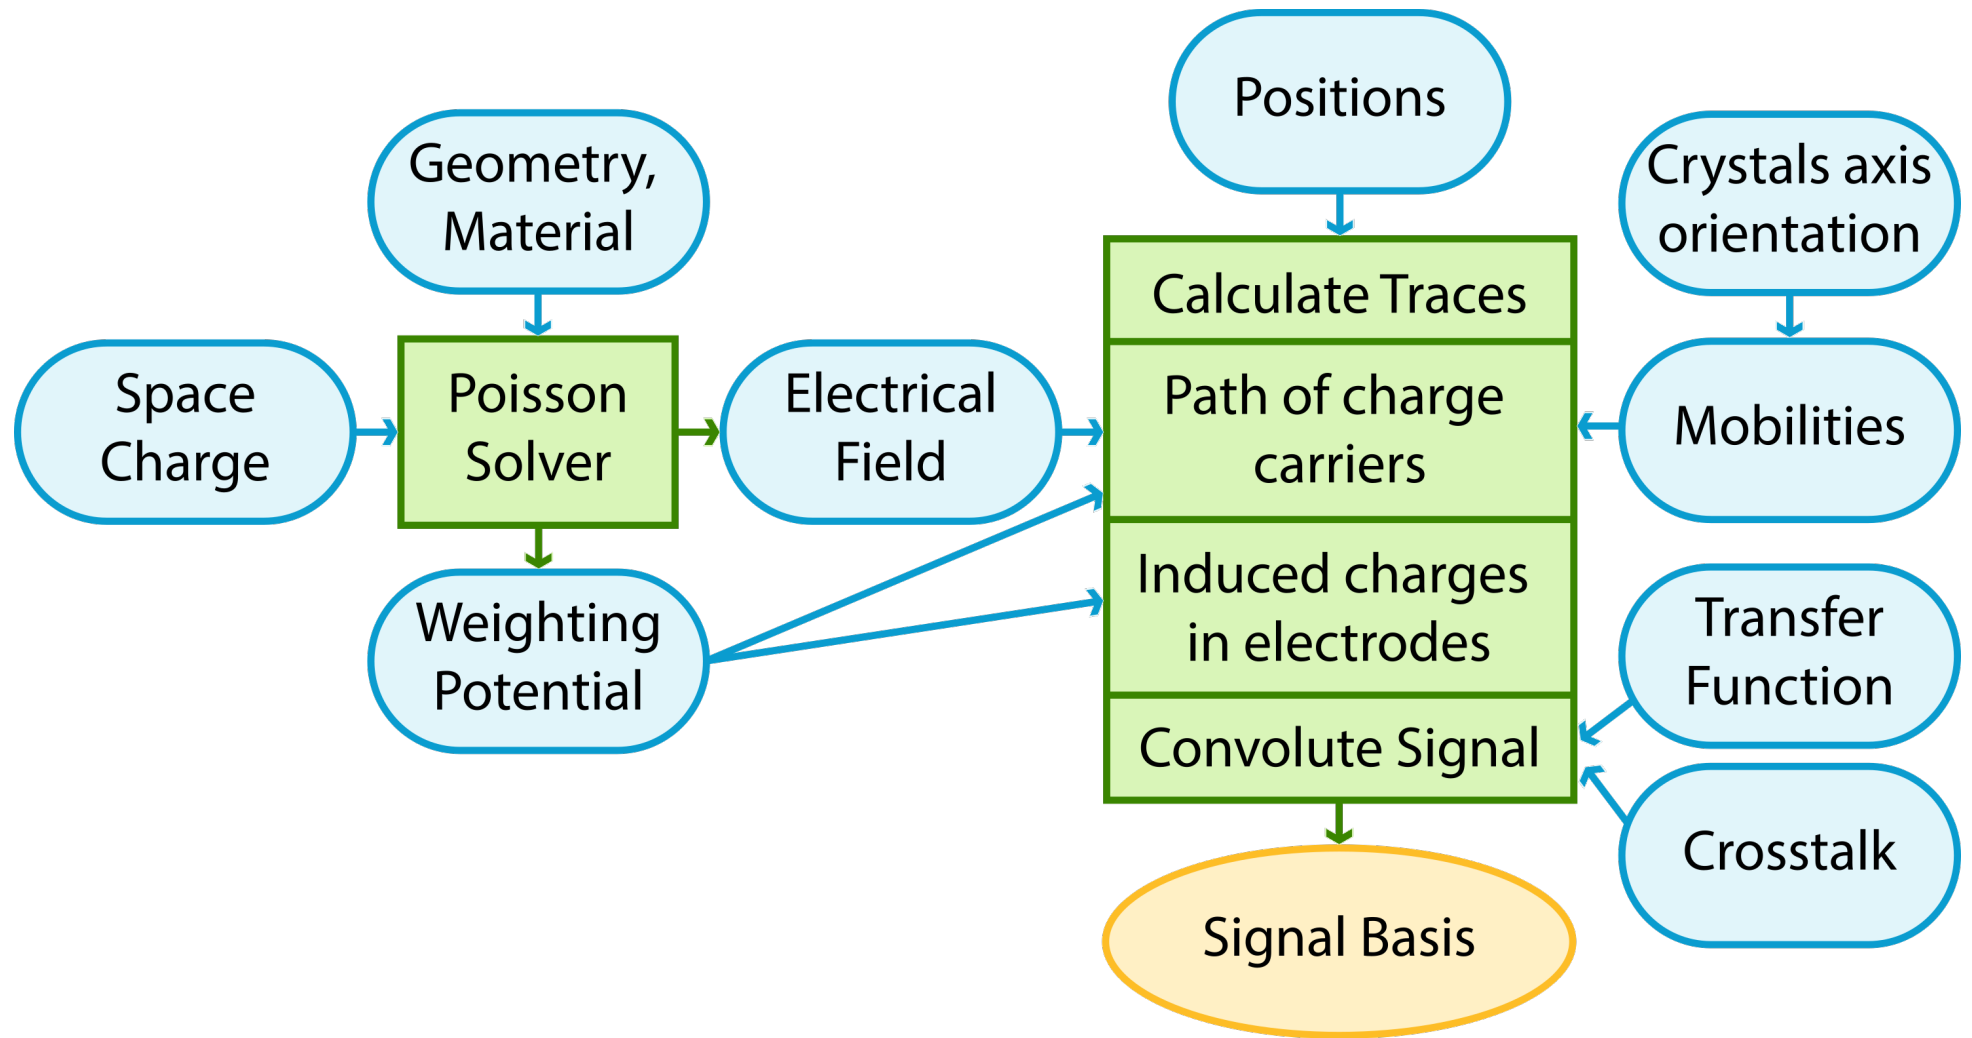

Weighting Potential (Shockley-Ramo)

Induced charge from
electrons and holes
is given by:

$$Q_{qi}(t) = q[\phi_i(x_e(t)) - \phi_i(x_h(t))]$$

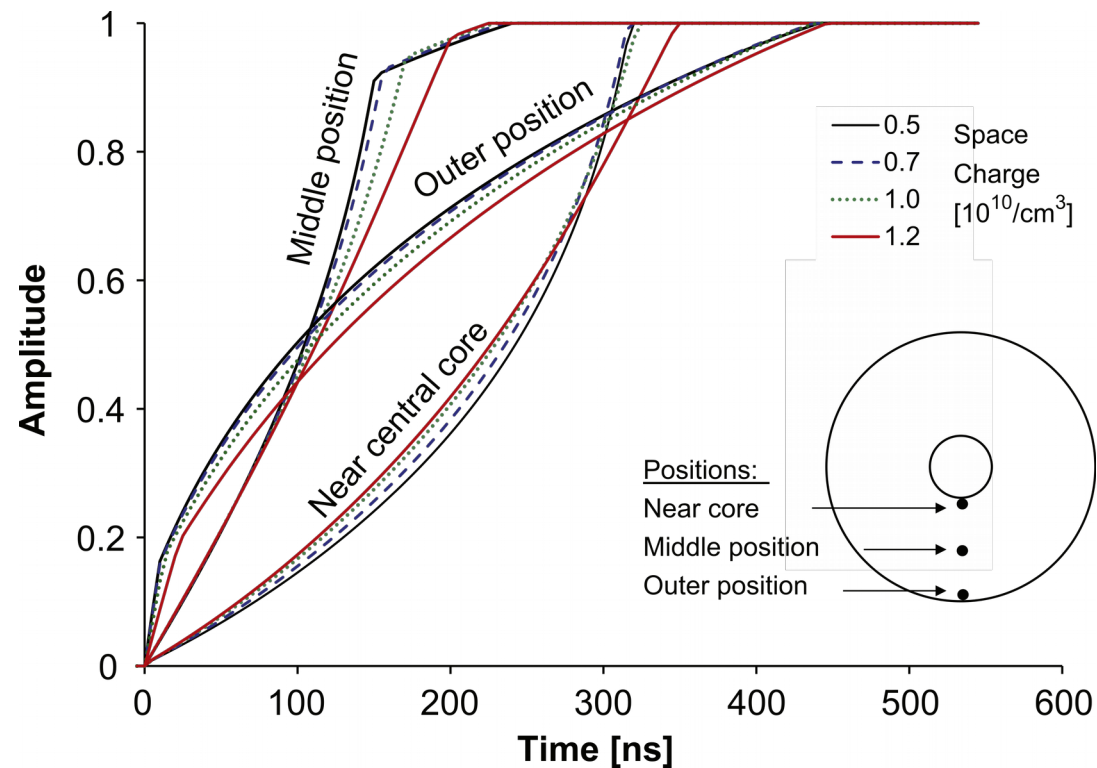

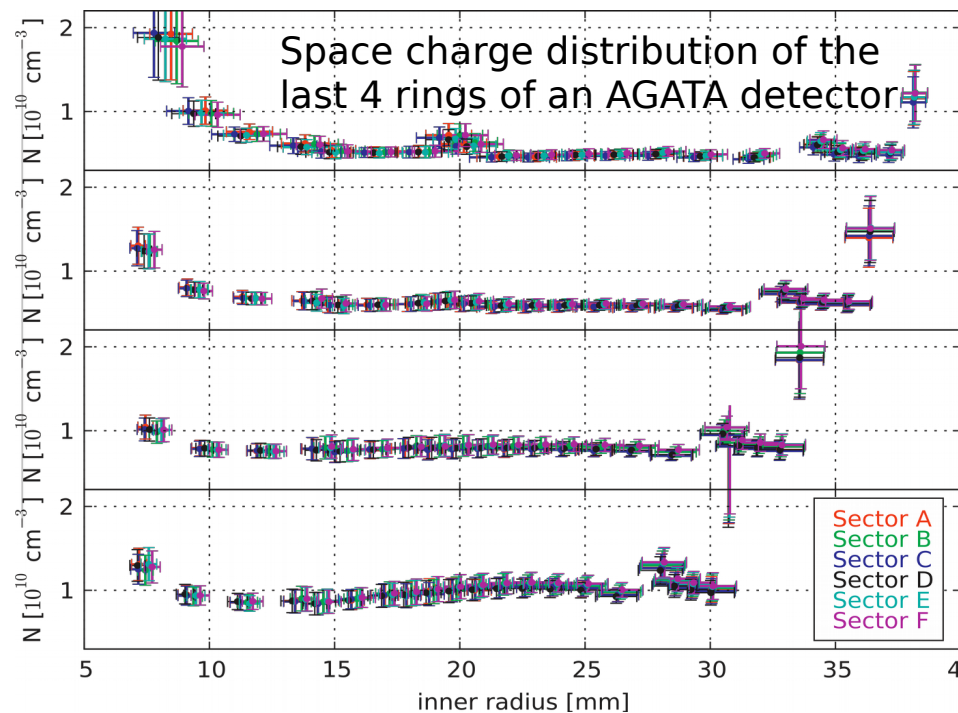

Overview

Space charge

Impurity concentrations

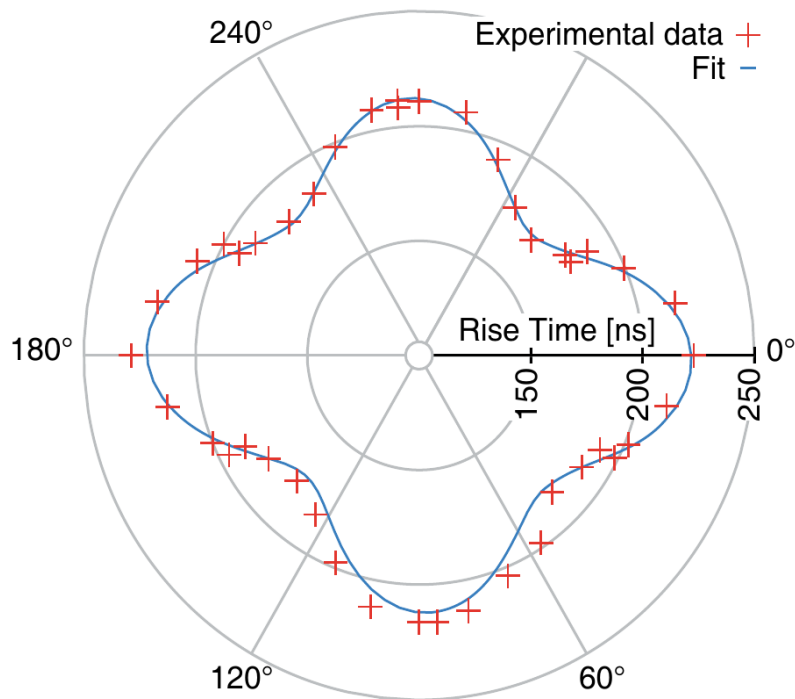

- 45 crystals
- Min. $0.35 \times 10^{10} \text{ cm}^{-3}$
- Max. $1.97 \times 10^{10} \text{ cm}^{-3}$
- Verified by measurements
- Radial symmetry
- Approx. linear gradient front to back

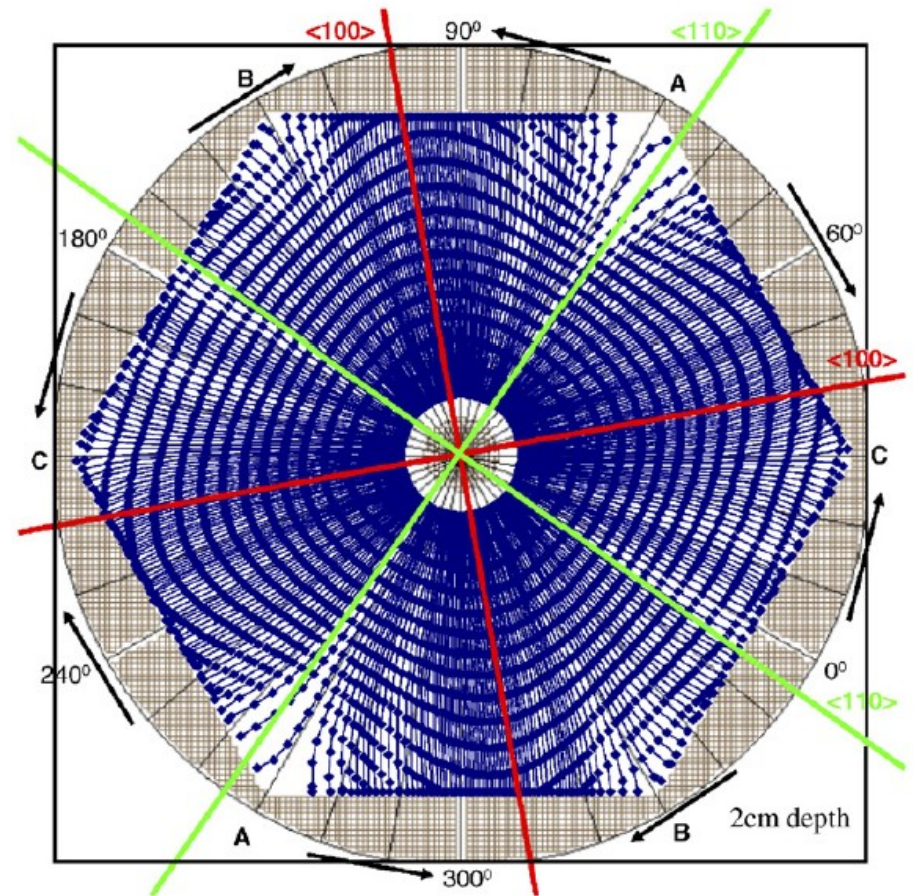

Charge carrier mobility

Charge carrier mobility

- Depends on:
 - Applied electrical field
 - Crystal axis orientation
- Different for electrons and holes

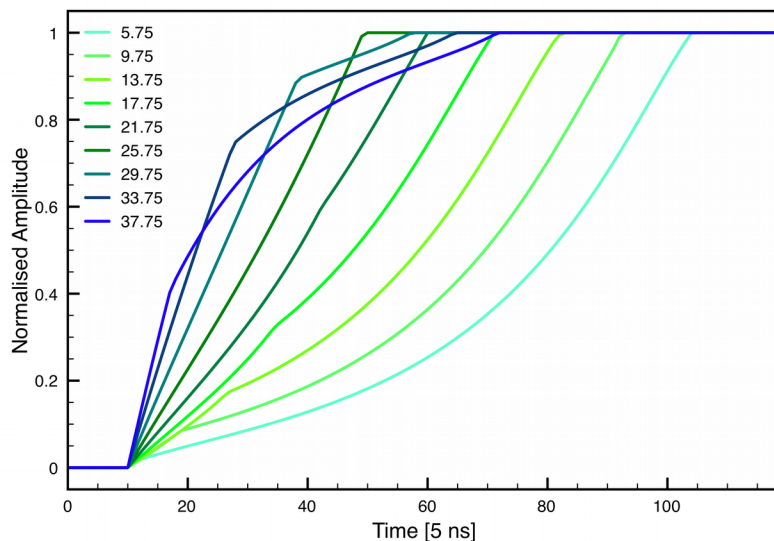

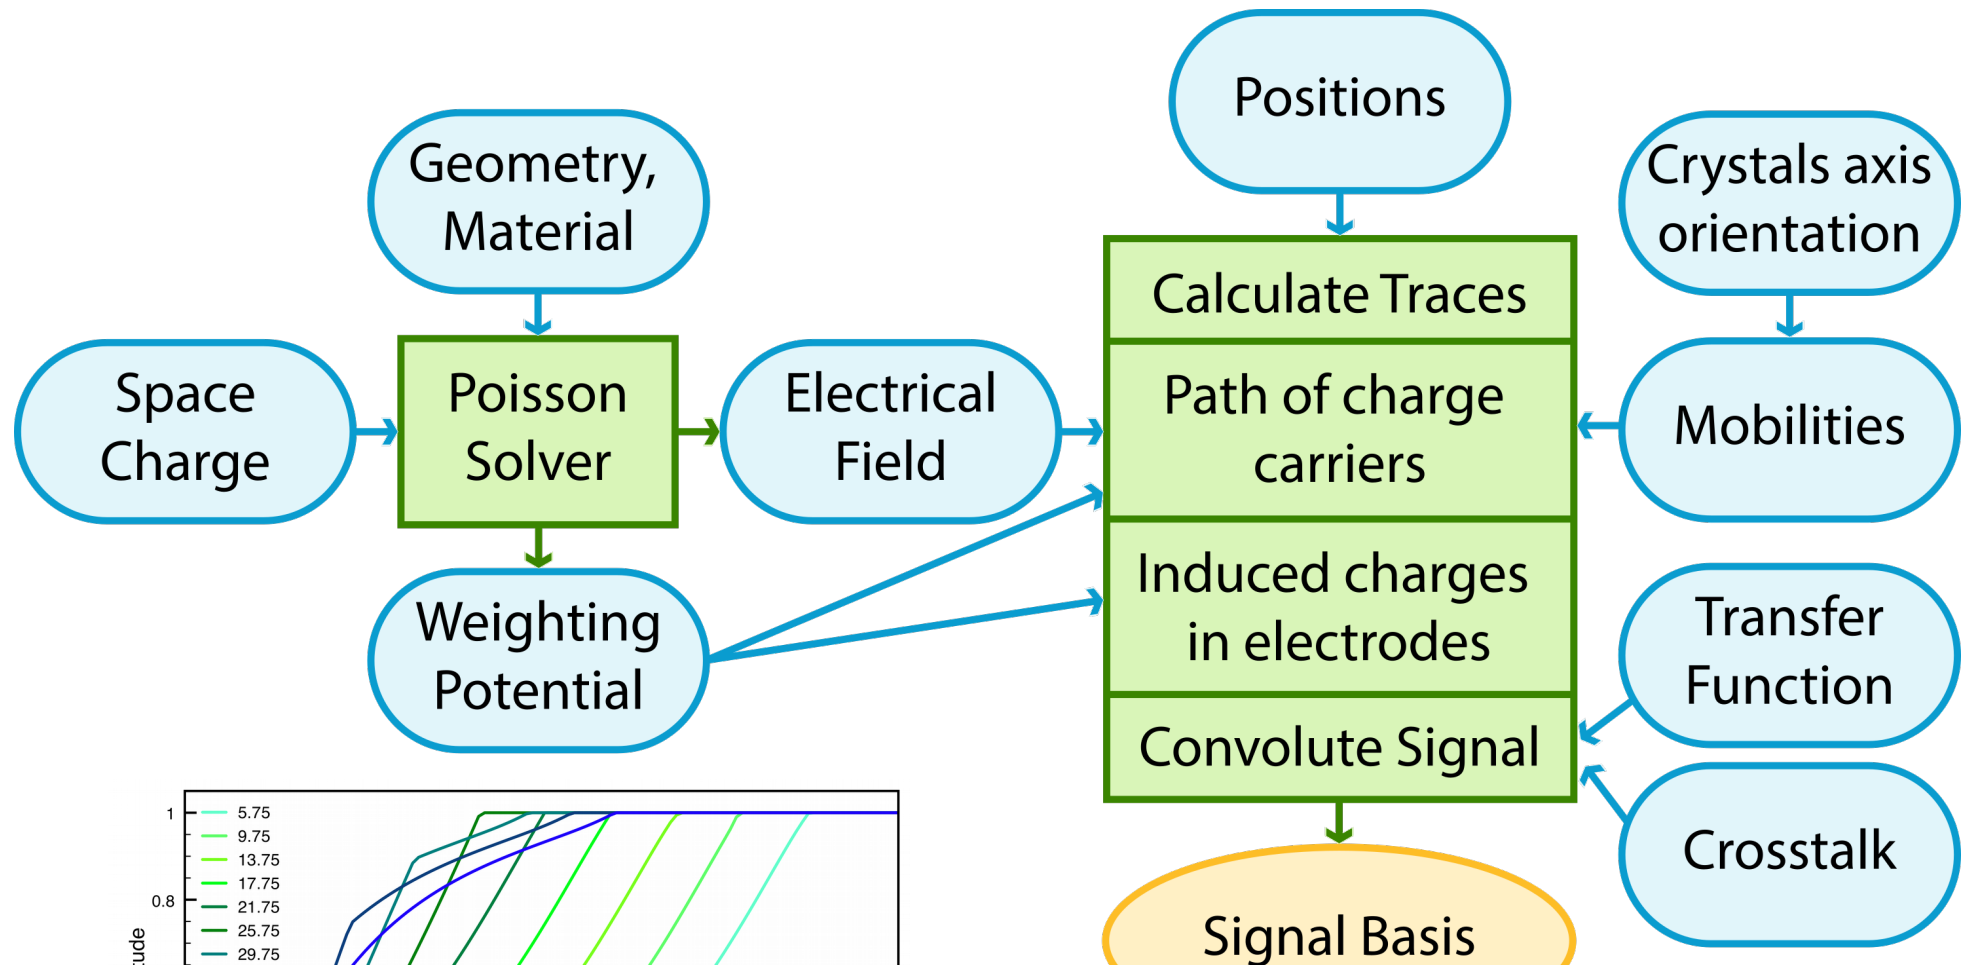

Rise time in ns for different angles

B. Bruyneel et al. Eur. Phys. J. A (2016) 52: 70

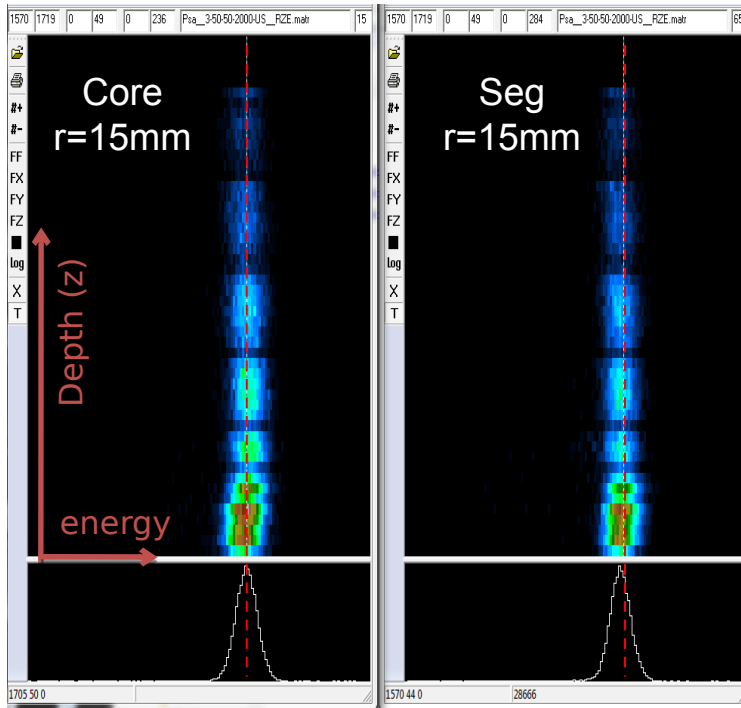

B. Bruyneel et al. NIMA 569 (2006) 774-789

Overview

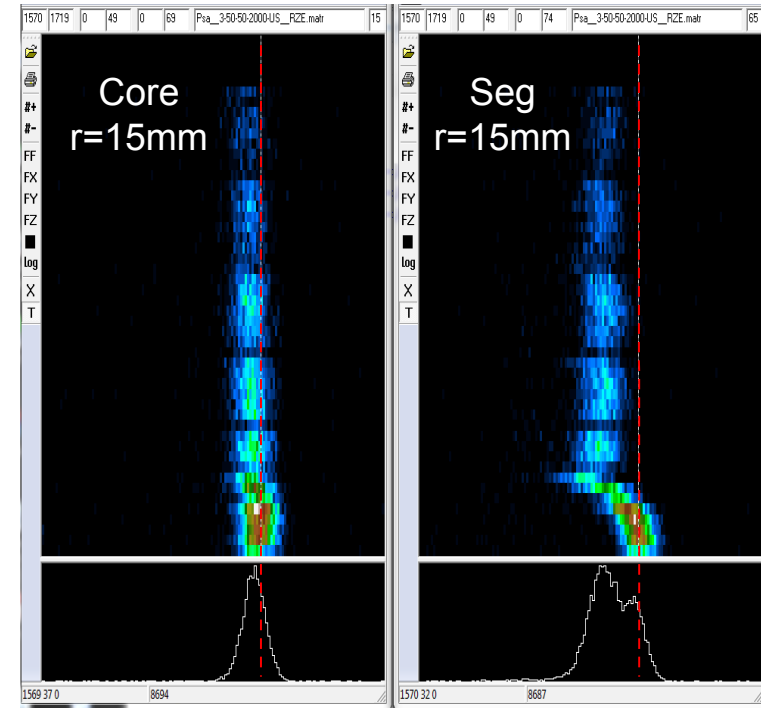

Charge carrier trapping

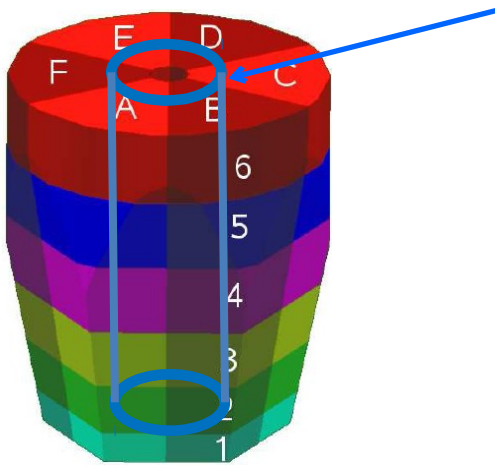

Before

After

The 1332 keV peak as a function of crystal depth (z)
for interactions at $r = 15\text{mm}$

- Charge carrier loss due to neutron damage
- Proportional to the path length to the electrodes
- PSA barely affected
- Knowledge of interaction position
- Correction possible

Summary

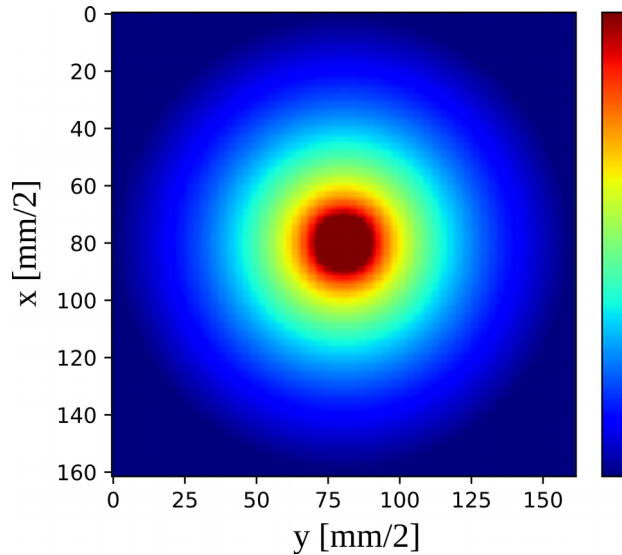

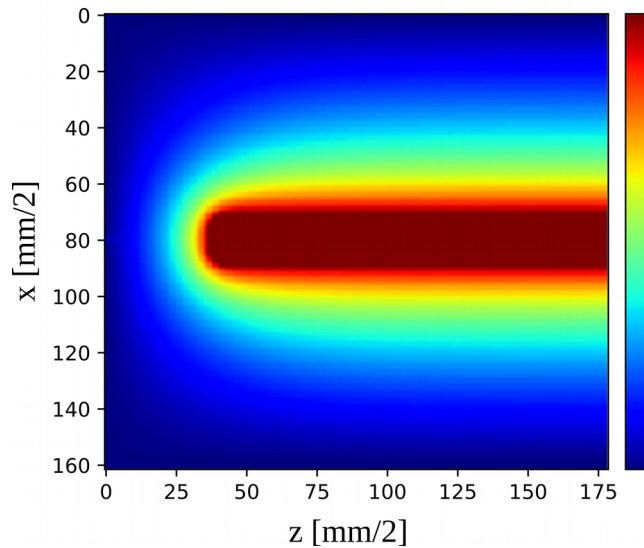

- **Simulation input**
 - Linear space charge distributions
 - Weighting potentials
 - Anisotropic charge carrier mobility model
- **AGATA signal basis**
 - Type A,B,C
 - Impurity concentration
 - Bias Voltage
 - (Crystal axis orientation)
- **Spacial resolution**
 - 4-5 mm P.A. Söderström et al., NIM A 638, 96 (2011)
- **Results**
 - Simulated pulse shapes
 - Trapping sensitivities

Thank you for your attention!

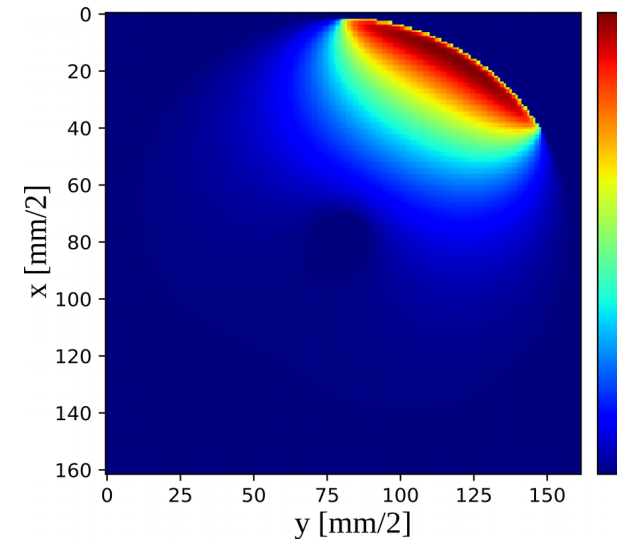

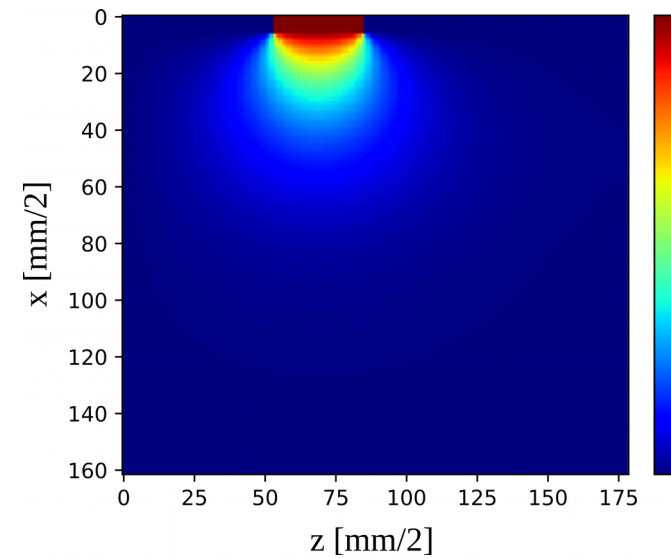

ADL – Weighting potentials

Core electrode

Segment C3

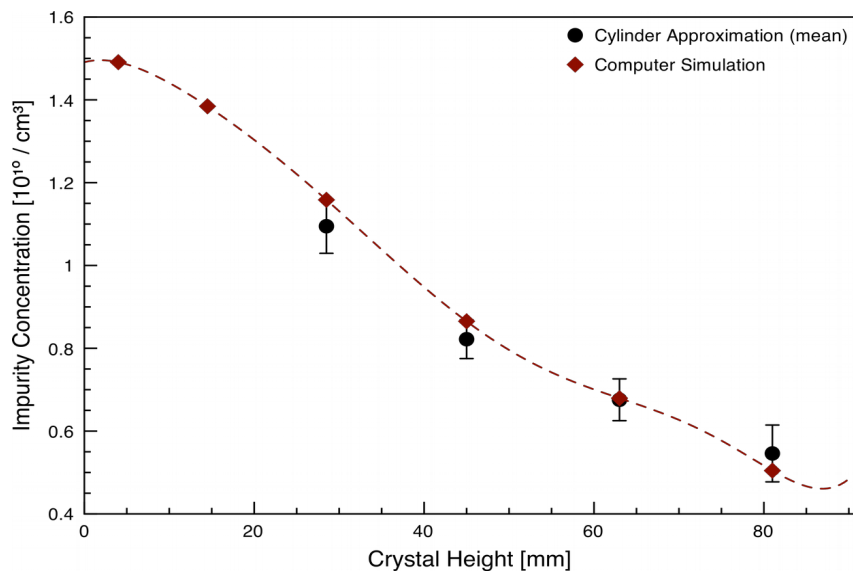

Measured Impurity Concentrations

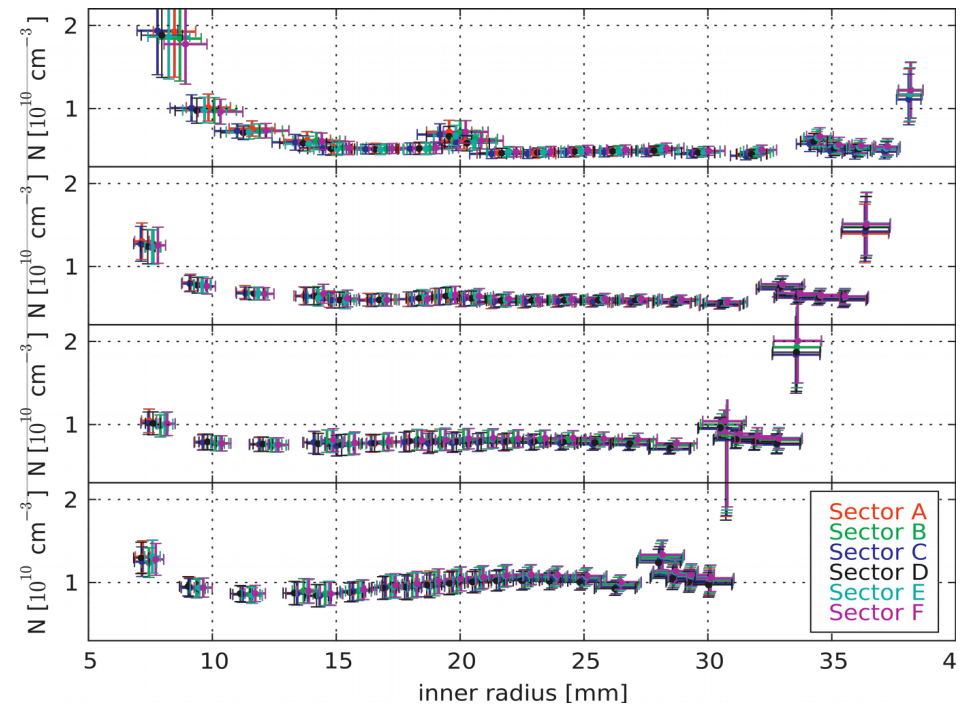

Impurity concentration given by the manufacturer:

- front: $1.8 \times 10^{10} \text{ cm}^{-3}$
- back: $0.5 \times 10^{10} \text{ cm}^{-3}$

Measured height dependence

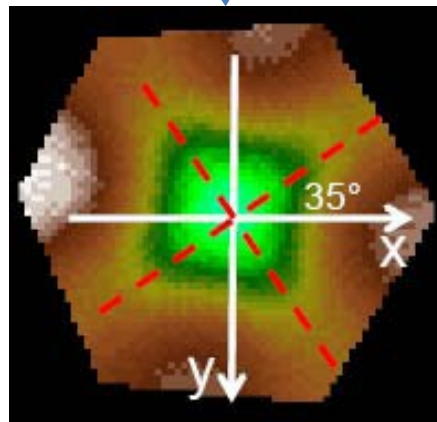

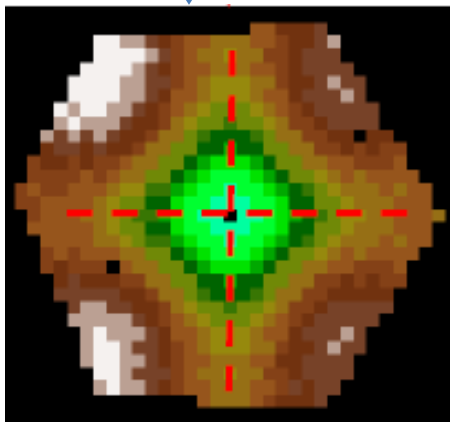

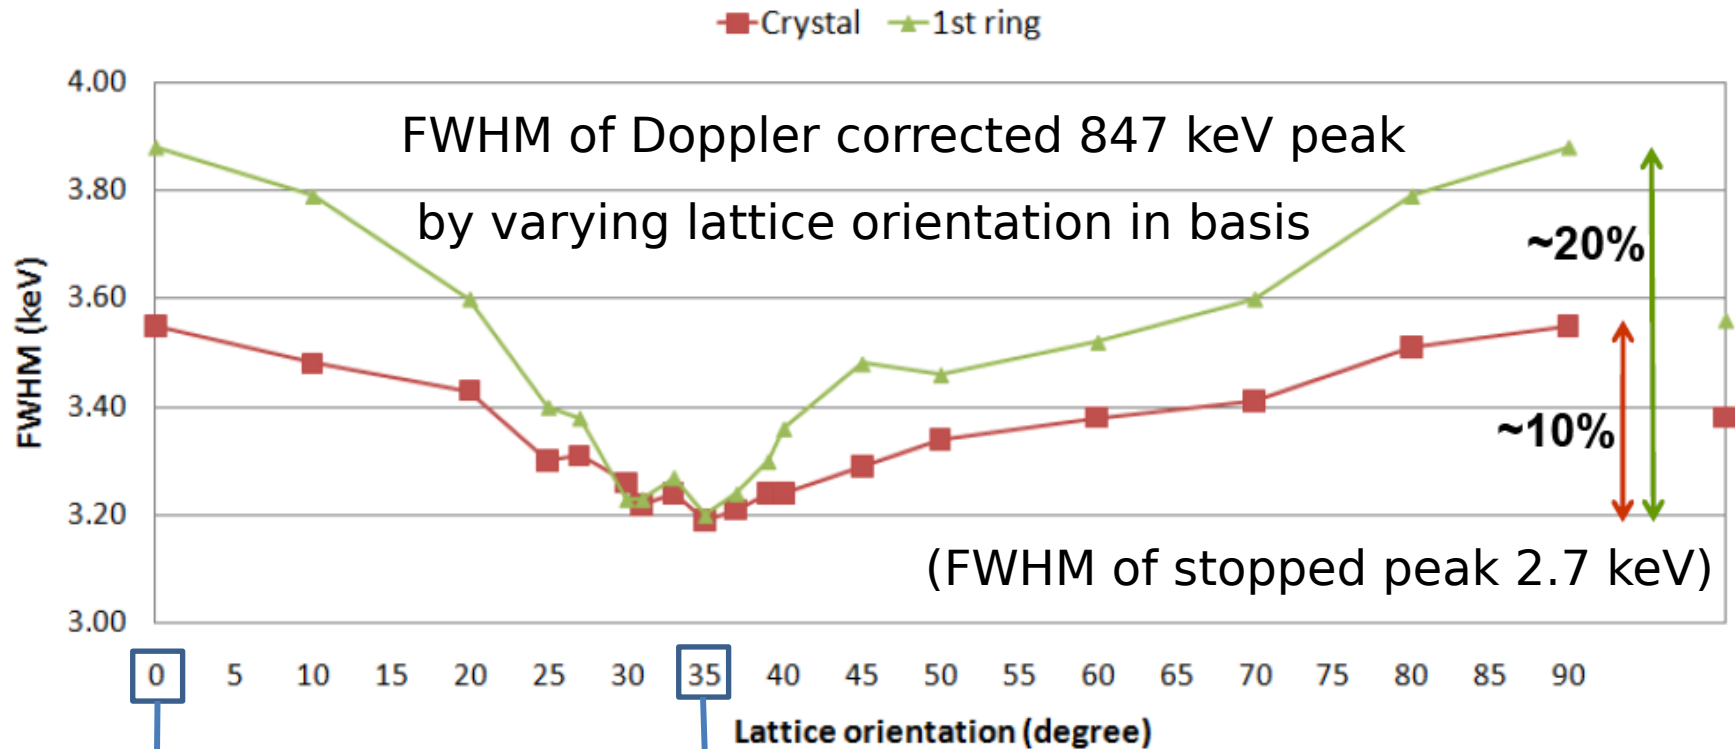

Measured radial dependence

Influence of crystal orientation

^{56}Fe at 220 MeV \otimes ^{197}Au , E_γ 847 keV; ^{56}Fe recoils detected in DANTE; $\beta = 8\%$

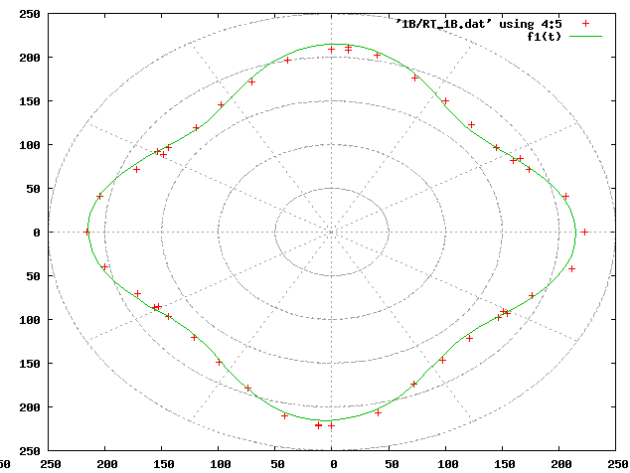

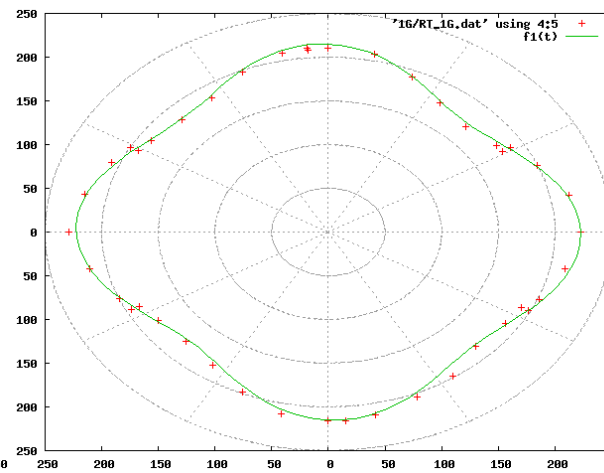

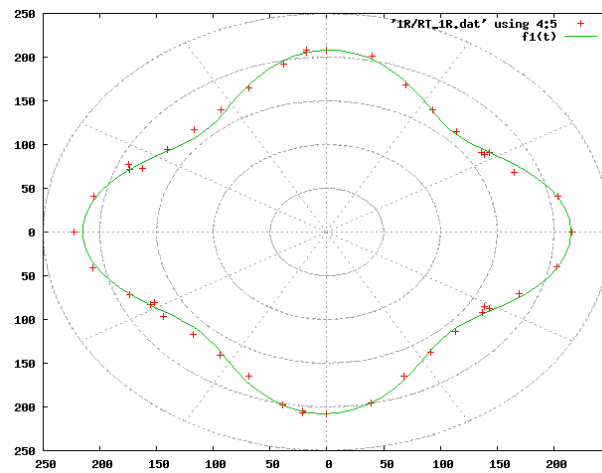

Main improvement in 1st ring
Front view of T10-90 simulations
Angles with respect to x-axis

Electron mobility parameters

Mobility along $\langle 100 \rangle$		Inter valley scattering rate	
E_0 [V/cm]	507.7	E_0 [V/cm]	1200
β	0.804	ν_0	0.459
μ_0 [cm ² /V s]	37165	ν_1	0.0294
μ_n [cm ² /V s]	−145	ν_2	0.000054

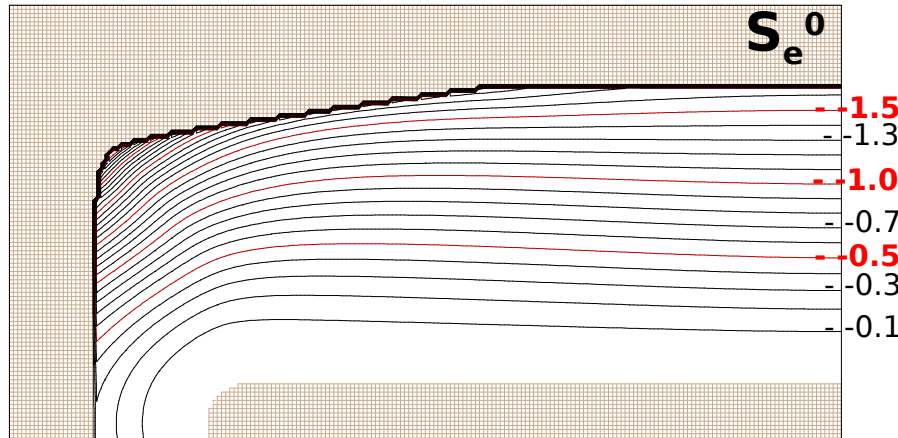

Hole mobility parameters

Mobility along $\langle 100 \rangle$		Mobility along $\langle 111 \rangle$	
E_0 [V/cm]	181.9	E_0 [V/cm]	143.9
β	0.735	β	0.749
μ [cm ² /V s]	62934	μ [cm ² /V s]	62383

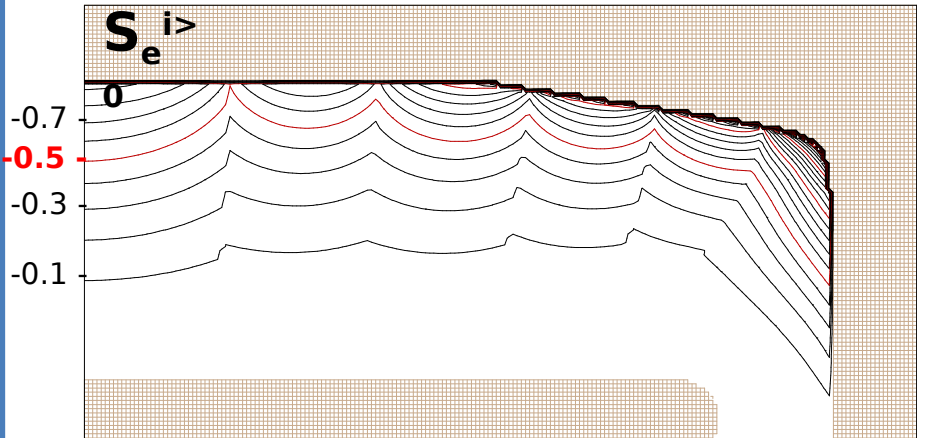

Sensitivity $s_{e,h}^i$

Electron trapping

For
Core

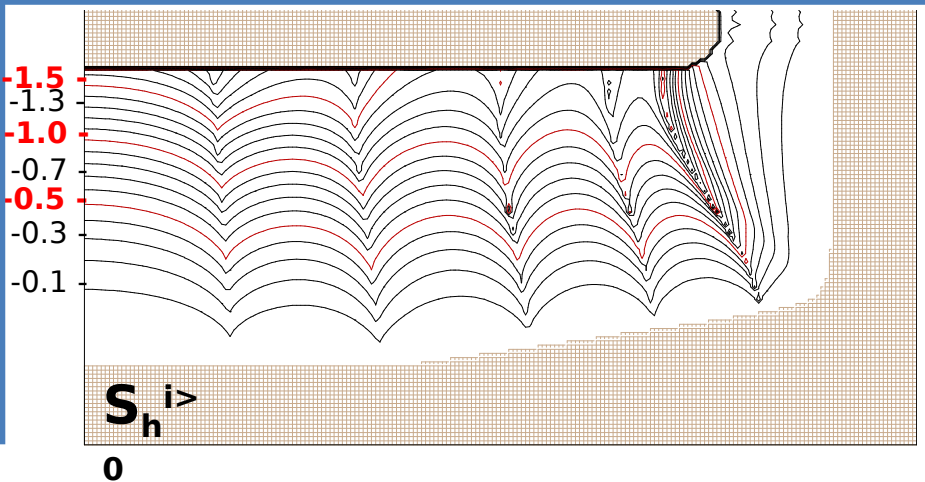

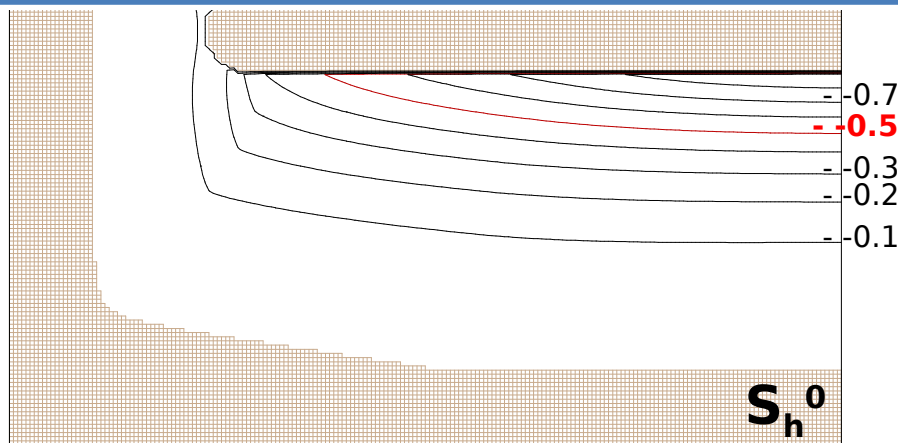

For
Segments

Electron trapping

Hole trapping

Hole trapping

- Core more sensitive to E-trapping
- Segments more sensitive to H-trapping
- E-trapping maximal at large radius
- H-trapping minimal at large radius
