Continuouswave laser runs

Pulsed laser runs

LHC Beam runs

Summary

Single event snapshot of the RICH2 panels (450GeV proton beams)

- Photodetector area: 3.3m²
- Single photon sensitivity: 200-600nm
- Quantum efficiency: >20%
- Good granularity: 2.5 x 2.5 mm²

- Active area fraction: 65%
- # of electronic channels: 500k
- LHCb DAQ rate: 40MHz
- Radiation tolerance: 3kRad/year

What is a Hybrid Photon Detector?

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuous wave laser runs

Pulsed lase runs

LHC Beam runs

Summary

Photon detector:

- Quartz-window, S20
 Photocathode
 - Active diameter 75mm
- Cross-focussing electrodes:
 - De-magnification by 5
- 20 kV operating voltage (5000e⁻)

Anode:

- 256 x 32 pixel Si-sensor array
- Bump-bonded to binary readout chip (low noise)
- 8-fold binary OR -> effective 32 x 32 pixel array

Testing of Individual HPDs

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed laser runs

LHC Beam runs

Summary

Every HPD is comprehensively tested for all the necessary

parameters:

- Signal over Noise
- Photocathode voltage (High Voltage) stability
 - Dark count
- Vacuum quality etc.
- Testing has yielded excellent results (>98% pass rate)
- We have tested 10% for quantum efficiency
 - Significant improvement seen over the course of production (25%→30%)
- HPDs installed by column into RICH detectors

Top: Pixel thresholds of an HPD Bottom: Quantum efficiency by batch

HPD Response in Dark Conditions

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

- Pulsed lase runs
- LHC Beam runs

Summary

Dark count is dependent

on:

- Temperature (thermo-ionic emission)
- Stray Light
- Other light sources (Laser Alignment Measurement System)
- Hardware issues e.g. noisy pixels, disabled L0 boards

Left: Photoelectron rate - each RICH HPD received, on average, 0.04 photoelectrons per event

Above: RICH1 Pixel hitmap

HPD Response under Laser Light

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed lase runs

LHC Beam runs

Summary

Used for:

Ion Feedback measurements

Photocathode Image Position measurements

Left: Photoelectron rate - each RICH1 HPD received, on average, 4.3 p.e/event (2.8 for RICH2)

Above: RICH2 Pixel hitmap

What is Ion Feedback?

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed lase runs

LHC Beam runs

Summary

- Ionisation of residual gas molecules.
- Shower of secondary

photoelectrons.

- Delayed by 200-300ns w.r.t. primary photoelectron.
- Hits concentrated at centre of photocathode.
- Detectable as large clusters of pixels.

Above: Cluster-size distributions

Below: HPD pixel hitmaps

 We define minimum "Cluster-size" thresholds for ion feedback rates (>=5 adjacent pixels in picture)

Ion Feedback Distribution

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed lase runs

LHC Beam runs

Summary

- The majority of RICH HPDs retain an excellent vacuum quality.
- Residual gas ionisation may become self-sustaining for HPDs with large ion feedback:
 - Probability gas ionisation x Electron Multiplicity > 1
 - We define a threshold (5%) above which an HPD is considered at risk

HPDs currently in RICH detectors

Above: Ion feedback distribution of HPDs removed from RICH detectors

3

Predicting HPD lifetime

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed lase runs

LHC Beam runs

Summary

- We observe a lower increase in ion feedback rate over periods of constant illumination.
- Fit linearly and extrapolate forward in time → HPD lifetime prediction.
- We have removed 86 out of 484 (18%) HPDs from the RICH.

Above: Estimated time of 5% ion feedback pass (using linear fit)

Above: Ion feedback evolution of a typical HPD

< ロ > < 同 > < 回 > < 回 >

Time alignment of the HPDs

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed laser runs

LHC Beam runs

Summary

We want to ensure that the readout of our RICH HPDs occurs synchronously with the rest of LHCb.

- Time-align Level-0 boards (2 HPDs per board) individually:
 - 1 Pulsed laser light distributed to HPD panels
 - 2 Variable delay between laser and readout
 - 3 Board offset by average midpoint

Top-Right: Simplified time profiles Bottom-Right: Time scan of a typical interface board

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed laser runs

LHC Beam runs

Summary

RICH detected particles from an LHC beam coming from the "wrong" side of the detector

Readout out of time:

- "Strips" of pixel hits, perpendicular to pixel columns.
- Particles passing directly through silicon detectors.

Readout in time:

- Large clusters of pixel hits.
- Particles hitting the photocathode.

September '08: Beam-Splash events

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed laser runs

LHC Beam runs

Summary

Recorded picture of LHC beam hitting collimator

- >2000 hits per tube (C-side)
- All HPDs operational
- Photocathode surface clearly defined

Below: RICH2 hitmap from accumulated events

November '09: Beam Collisions at 450GeV

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed laser runs

LHC Beam runs

Summary

Below: LHCb Event Snapshot

RICH1 detected >200 hits/event

RICH2 detected >100 hits/event

Below: Trackless Ring-finding

- Run the trackless ring-finder on some rings.
- Look for isolated rings with quality criterion applied.

Upper-panel

Hit pull

(Expected - Observed)/Expected

.⊒...>

- uses a moving average.
- Large changes in output.

Summary

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed lasei runs

LHC Beam runs

- Low noise, high efficiency Hybrid Photon Detectors are now being utilised, via interface boards, in the RICH detectors.
- RICH HPDs show a good response to light under a variety of different run environments.
 - Through the ion feedback of an HPD, laser runs provide us with accurate lifetime predictions.
 - Pulsed laser runs have been used to time-align the RICH detectors.
 - LHCb-RICH detectors have already been operated successfully during beam start-up.

HPD Repair Campaign (1)

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photor Detector Specifications

Dark runs

- Continuouswave laser runs
- Pulsed laser runs
- LHC Beam runs

- RICH2 contains (from manufacture date) older HPDs than RICH1.
- A higher proportion of HPDs have developed a self-sustaining ionisation.

HPD Repair Campaign (2)

Operating the Hybrid Photon Detectors in the LHCb RICH counters

Ross Young

Hybrid Photon Detector Specifications

Dark runs

Continuouswave laser runs

Pulsed laser runs

LHC Beam runs

- RICH2 contains (from manufacture date) older HPDs than RICH1.
- A higher proportion of HPDs have developed a self-sustaining ionisation.
- We prioritise the removal of certain HPDs according to:
 - Predicted lifetime
 - Effect on physics performance
