

# Introduction to The Standard Model\*

Reina Camacho (LPNHE)  
JRJC 2018

VVF Villages Lège-Cap-Ferret, 14-20 Oct 2018

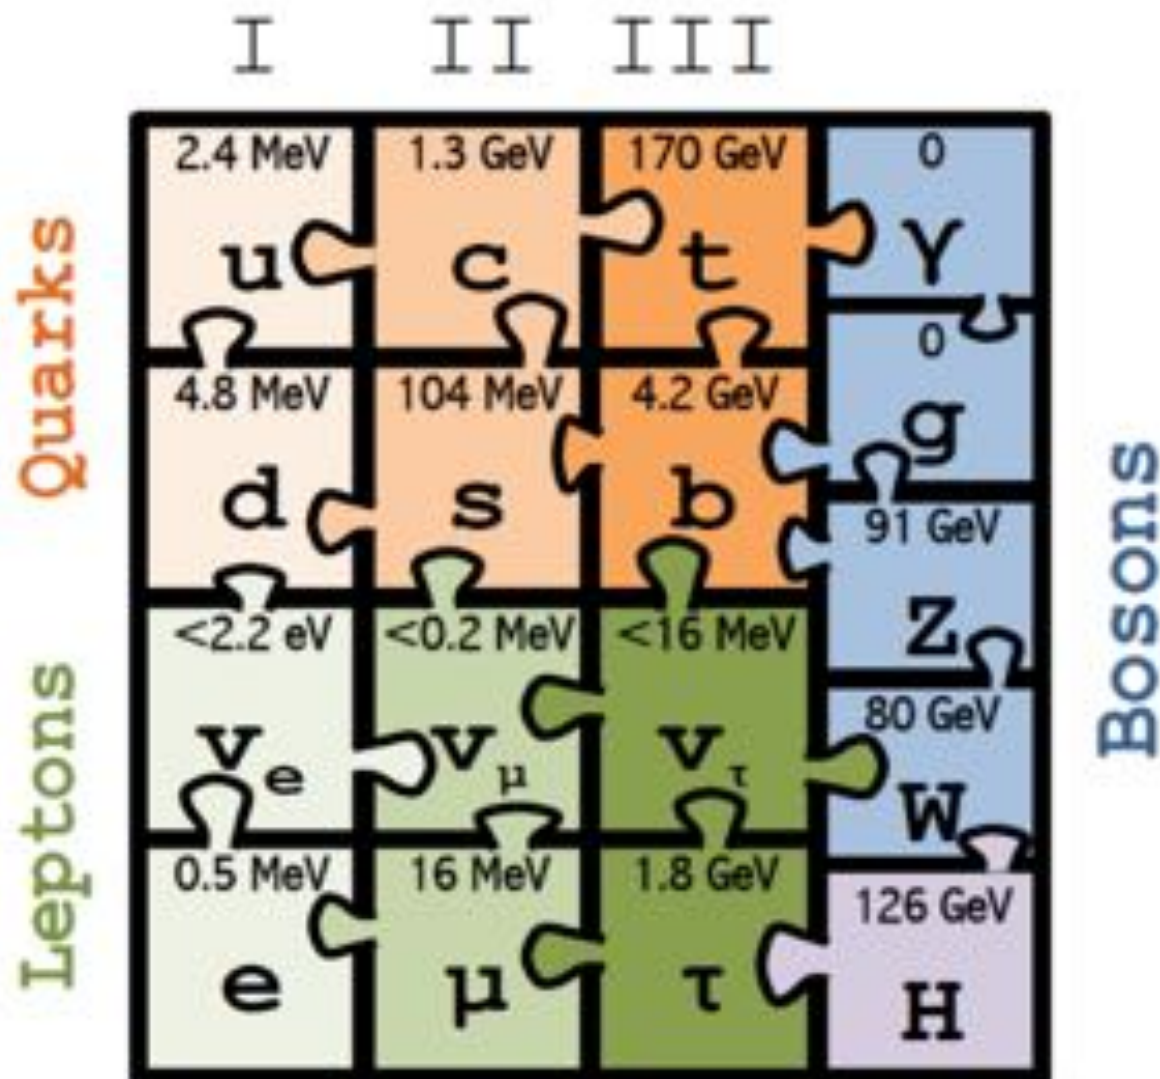

*\* A very biased introduction from an experimentalist!*

# The Standard Model (SM)

## Reminder

- A successful model (from the experimental point of view) that describes the interactions between known fundamental particles of matter

# The Standard Model (SM)

## Reminder

- The particle physics world in 1975
- The **local gauge symmetry** that defines the SM is

$$\text{QCD} \longrightarrow \text{SU}(3) \times \text{SU}(2) \times \text{U}(1) \longleftarrow \text{Electro weak}$$

- The group representation determines the interaction form
  - Leptons: SU(3) singlets  $\rightarrow$  do not interact strongly
  - Quarks: SU(3) triplets  $\rightarrow$  interact with gluons
- Parity violation  $\rightarrow$  Separation of the left and right SU(2) representations:
  - Left fermions: SU(2) doublets  $\rightarrow$  interact weakly
  - Right fermions: SU(2) singlets  $\rightarrow$  do not interact weakly
  - **No mass terms for fermions**
- Also, **no mass terms for bosons W and Z**

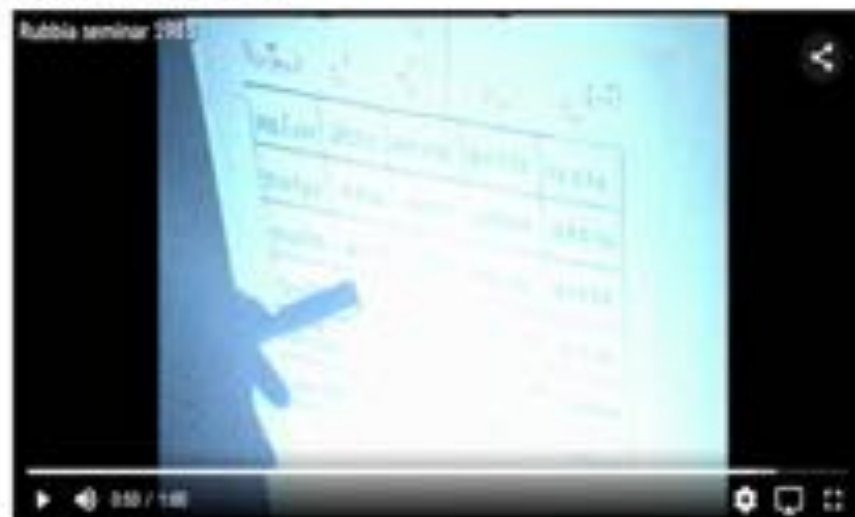

# The Standard Model (SM)

## Reminder

- The particle physics world in 1975
- The **local gauge symmetry** that defines the SM is

$$\text{QCD} \longrightarrow \text{SU}(3) \times \text{SU}(2) \times \text{U}(1) \longleftarrow \text{Electro weak}$$

- The group representation determines the interaction form
  - Leptons: SU(3) singlets  $\rightarrow$  do not interact strongly
  - Quarks: SU(3) triplets  $\rightarrow$  interact with gluons
- Parity violation  $\rightarrow$  Separation of the left and right SU(2) representations:
  - Left fermions: SU(2) doublets  $\rightarrow$  interact weakly
  - Right fermions: SU(2) singlets  $\rightarrow$  do not interact weakly
  - **No mass terms for fermions**
- Also, **no mass terms for bosons W and Z**
- In 1983 UA1 and UA2 announced the **discovery of a massive W boson**

# The Standard Model (SM)

*And the Higgs physics field was born...*

# The Standard Model (SM)

*And the Higgs physics was born...*

SM solution to the mass problem

Add scalar field with spontaneous symmetry breaking

W, Z boson masses

Add Yukawa couplings

Fermion masses

- ABEGHHK<sup>1</sup>H mechanism (known commonly as Higgs mechanism) proposed by three independent groups in 1964
- Yukawa interaction, was not formalized in first seminal papers (introduced by S. Weinberg)

# The Standard Model (SM)

*And the Higgs physics was born...*

- Mass is not an intrinsic property of particles, but results from an interaction with the Higgs field that fills the space
- The Higgs boson is the particle corresponding to the Higgs field

# The Standard Model (SM)

## Global overview

### QCD physics:

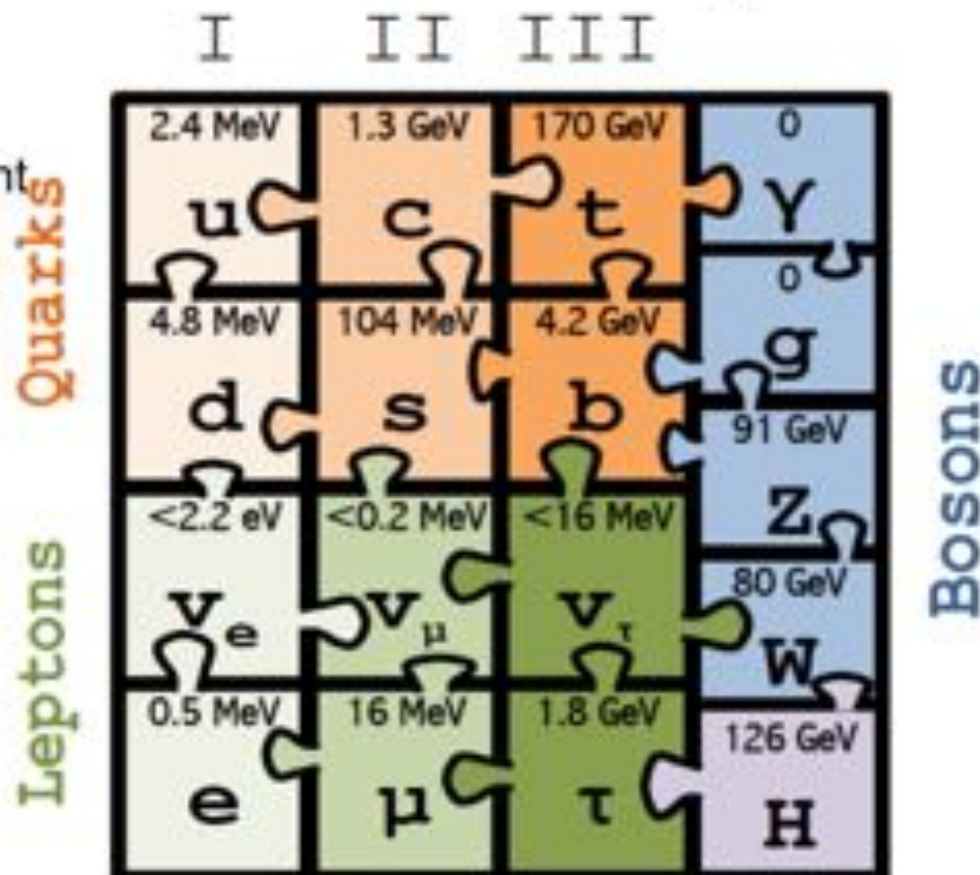

- Strong interaction
- 8 gluons, 6 quarks
- Asymptotic freedom (weakly interaction at high E) and confinement (strong at low E)
- In experiment → jets

### Neutrino physics:

- Weak interaction
- Tiny mass
- Sources: solar, nuclear reactors and accelerators

### Top physics:

- A special kind of quark
- Decays before hadronizing  $t \rightarrow Wb$

### Electroweak physics:

- Mostly related with boson measurements: W, Z, photons
- Precise tool to probe the gauge structure of EWK sector in the SM

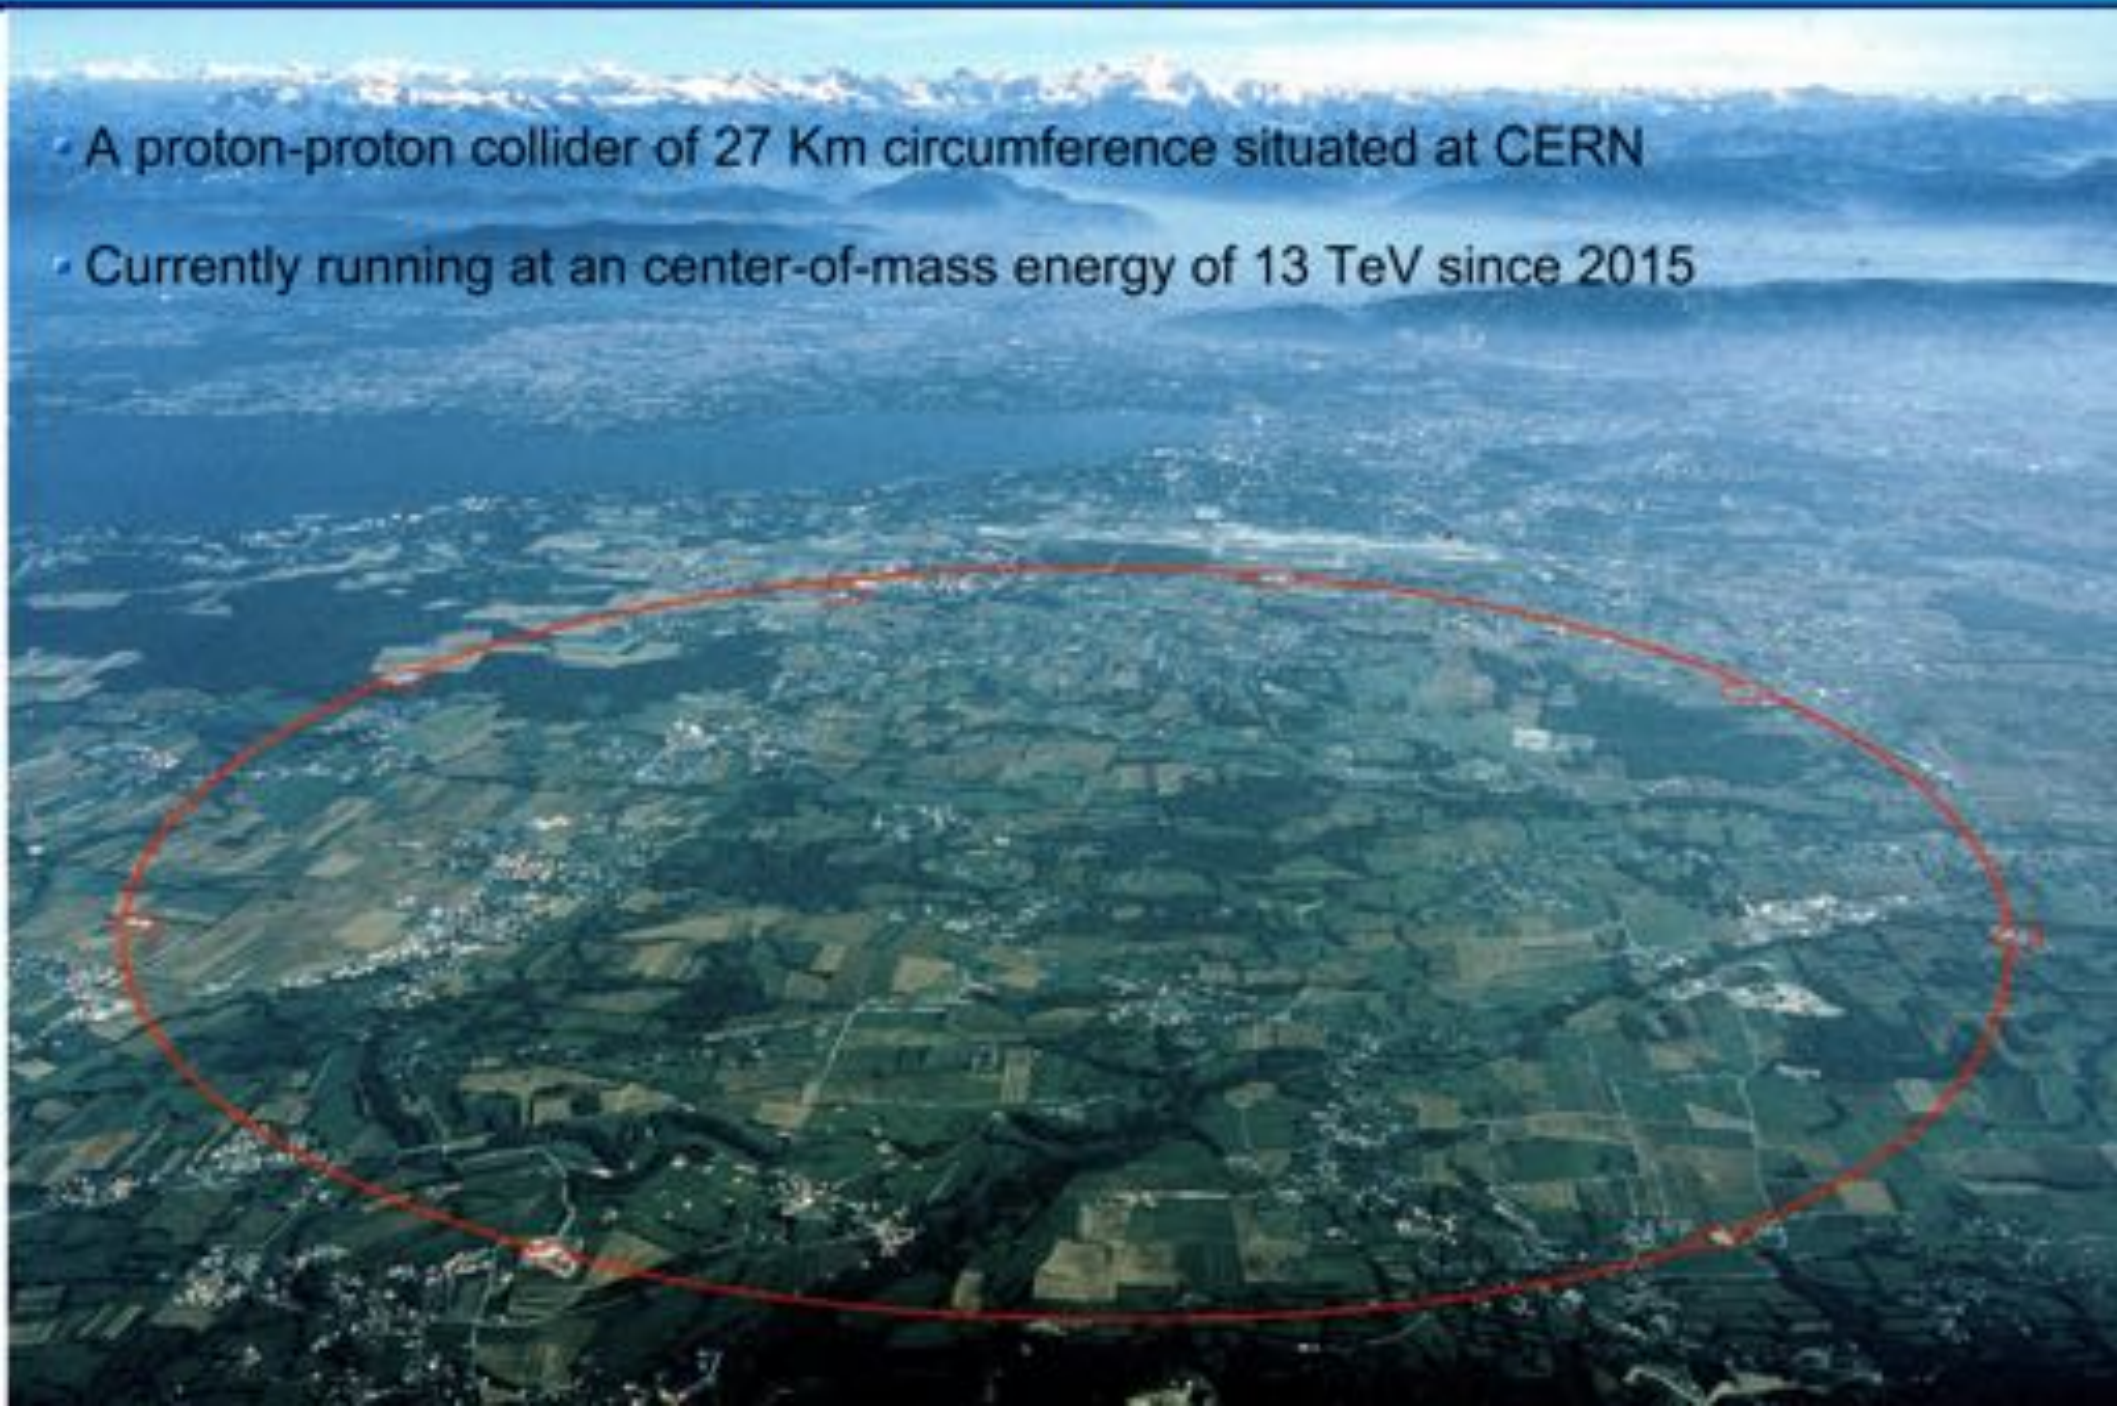

### Higgs physics:

- Will know a lot more after this session!

# So how do we study all these particles?

## *The current tools: The Large Hadron Collider (LHC)*

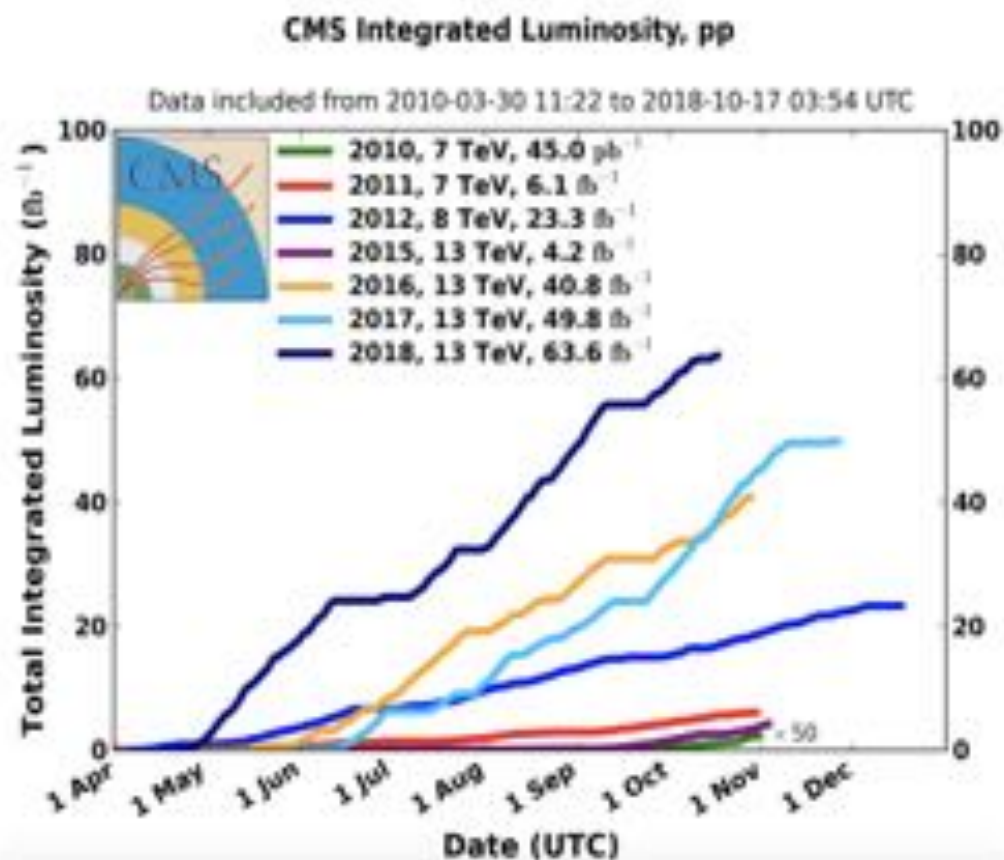

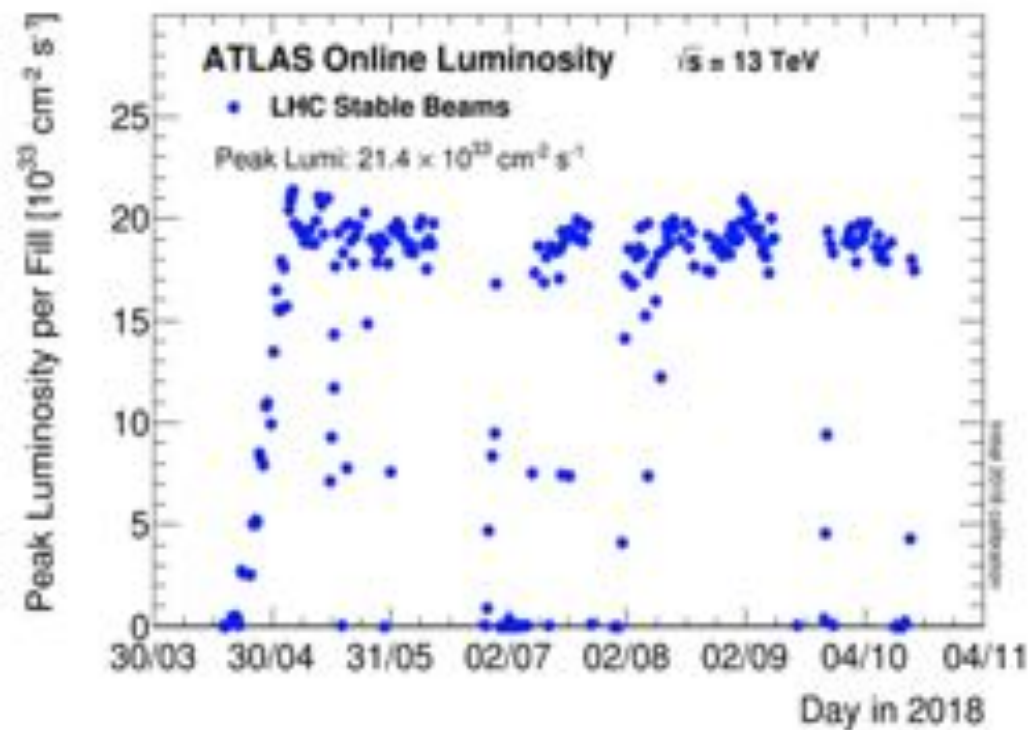

- A proton-proton collider of 27 Km circumference situated at CERN
- Currently running at an center-of-mass energy of 13 TeV since 2015

# So how do we study all these particles?

## LHC performance

$$N_{events} = \sigma \times L$$

Peak luminosity twice larger than LHC design luminosity!

$\text{fb}^{-1}$  is a measure of the amount of data collected  $\sim 10^{12}$  proton-proton collisions. Used to translate  $\sigma$  into a total number of events. For the SM  $Vh$  with  $h \rightarrow bb$  process,  $\sigma \sim 1305 \text{ fb} \rightarrow$  in  $100/\text{fb}$  of collected data, we expect a total of 130500 events

# So how do we study all these particles?

(Outstanding) LHC performance

$$N_{\text{events}} = \sigma \times L$$

Future integrated luminosity goals:

- ▶ 300 /fb until 2023
- ▶ >3000 /fb at the end or the HL-LHC to start in 2026

# So how do we study all these particles?

## *The particle detectors*

- I know there are more than two but will mainly hear in this section about these two
- Non-specialized detectors: broad range of physics, same concept, different technologies
  - Excellent vertex and tracking systems
  - Large coverage for muon detection
  - Excellent calorimetry with extended coverage

# So how do we study all these particles?

## *The ATLAS detector*

# So how do we study all these particles?

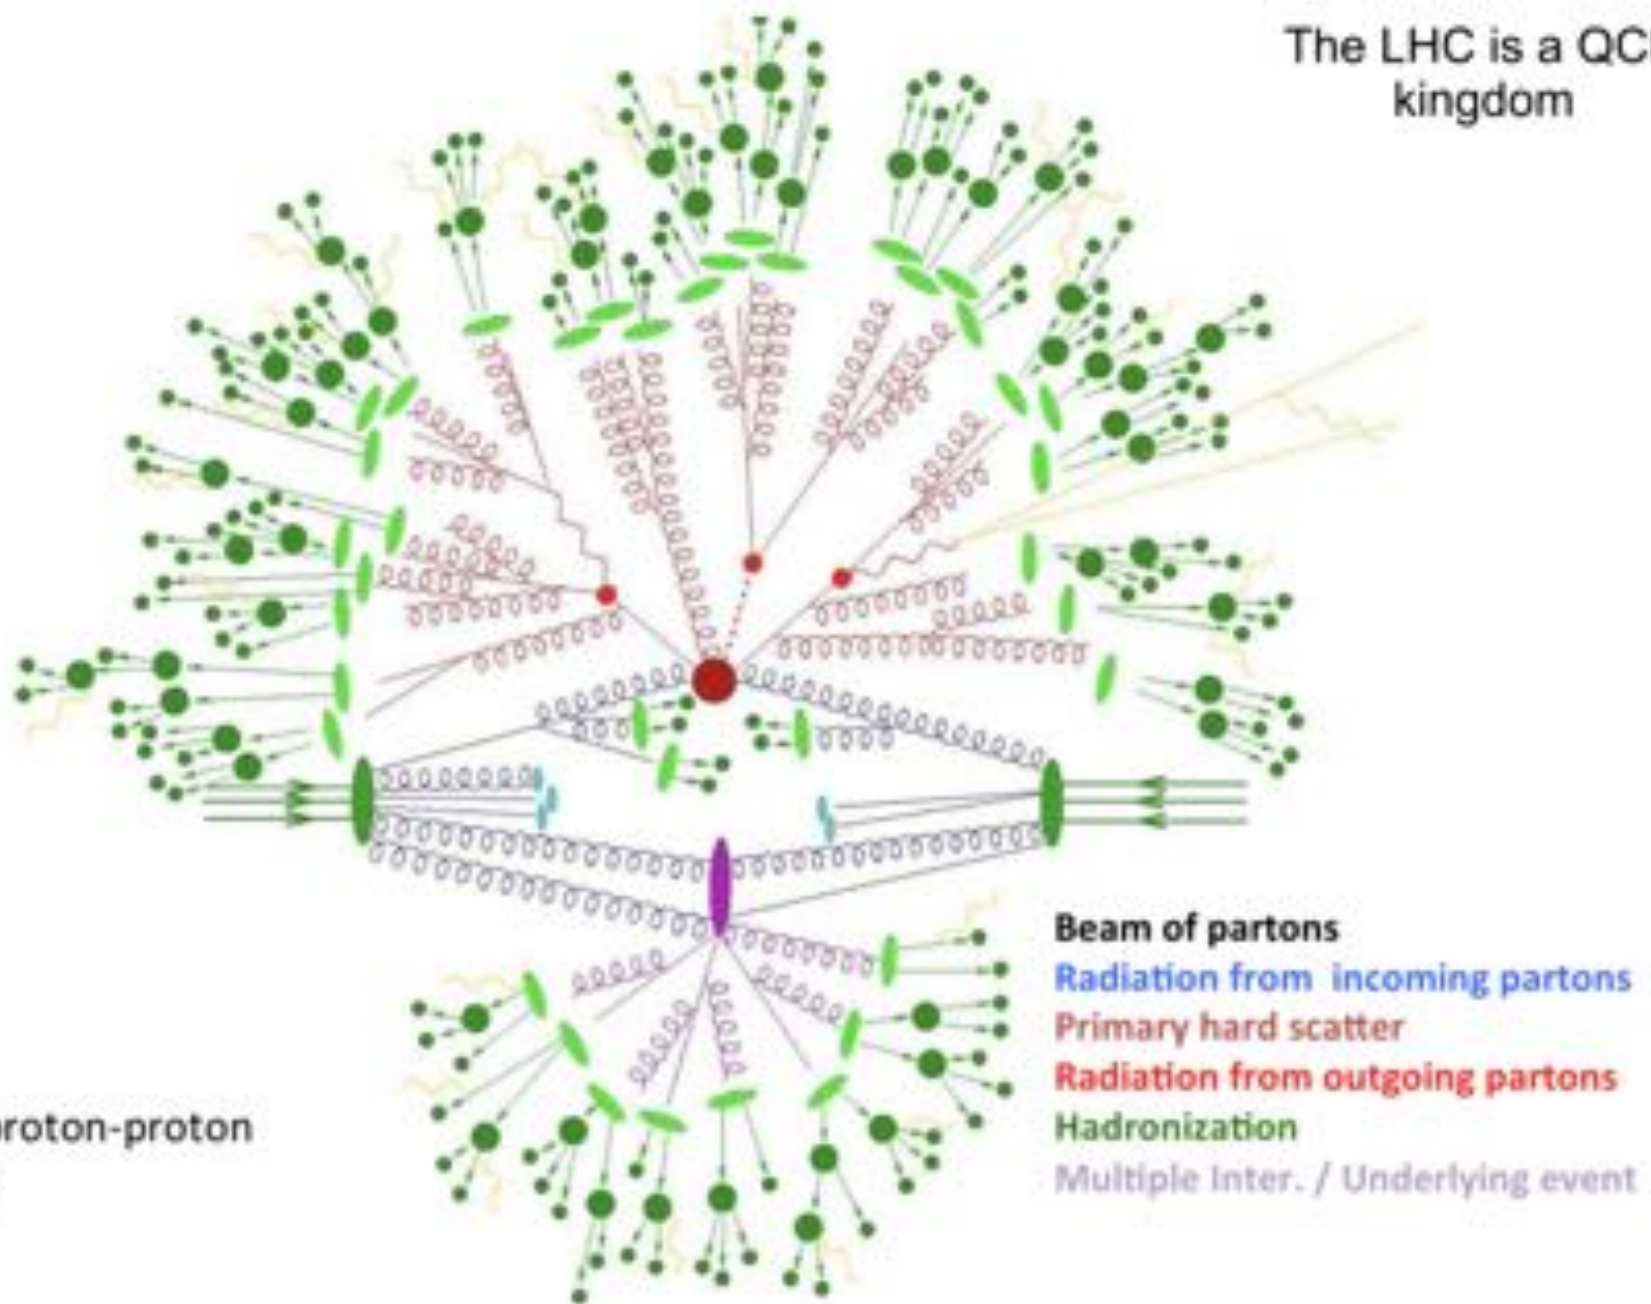

## *The CMS detector*

# So how do we study all these particles?

## *The collisions*

The LHC is a QCD kingdom

Typical proton-proton collision

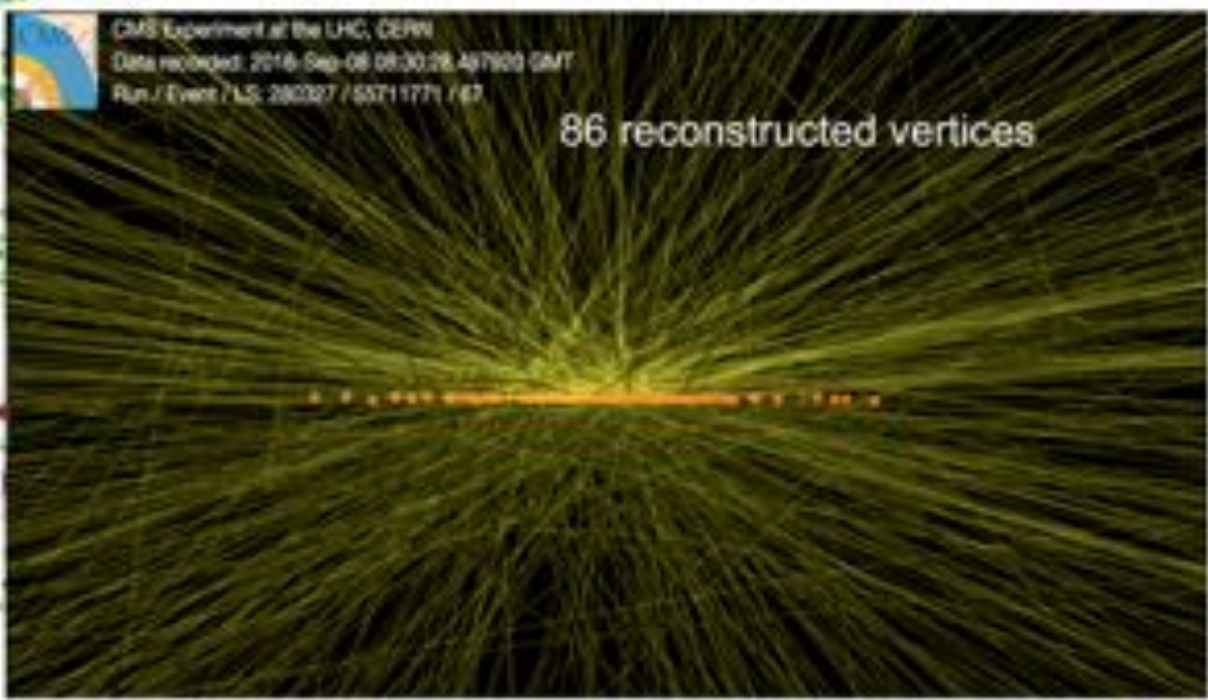

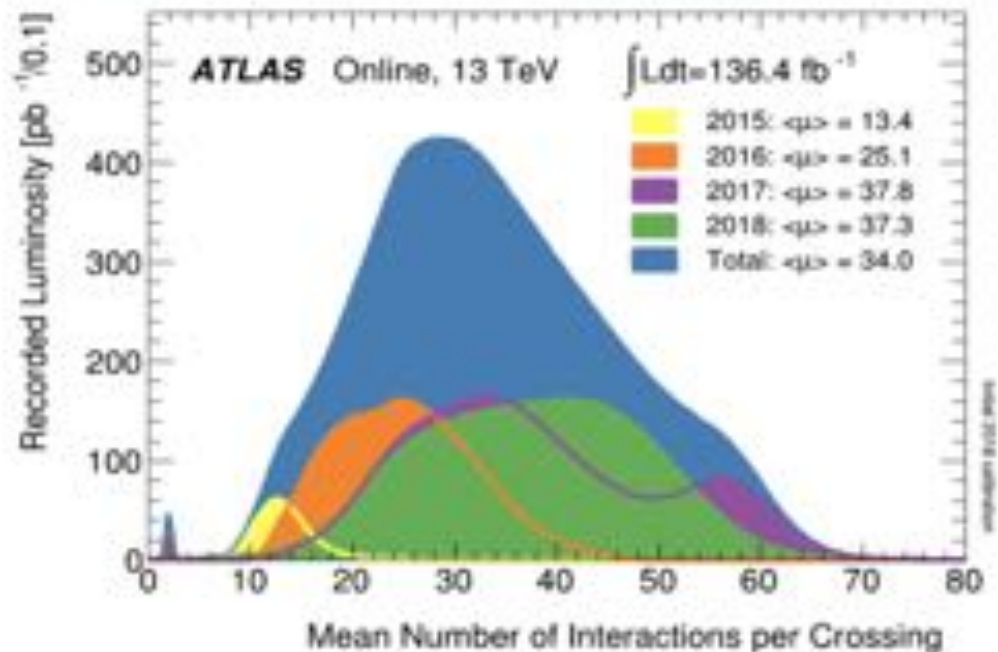

# So how do we study all these particles?

## The collisions

High Lumi  
=  
high pileup

Impressive  
detectors

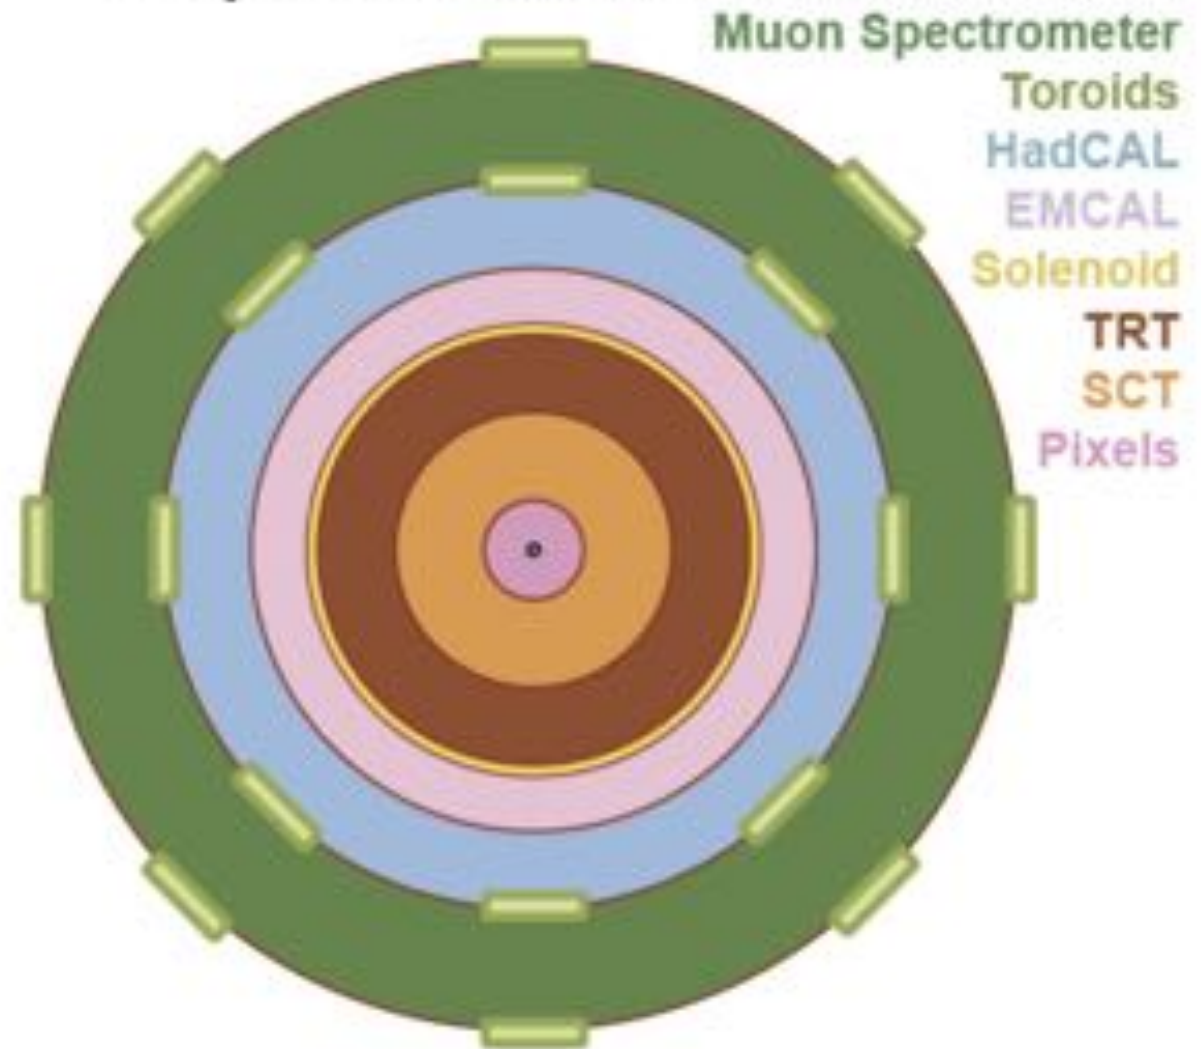

# So how do we study all these particles?

*How do we detect the particles?*

	I	II	III

Bosons

## Simplified Detector Transverse View

See Hicham A. and Mykola K.'s talks

From the experimental point of view

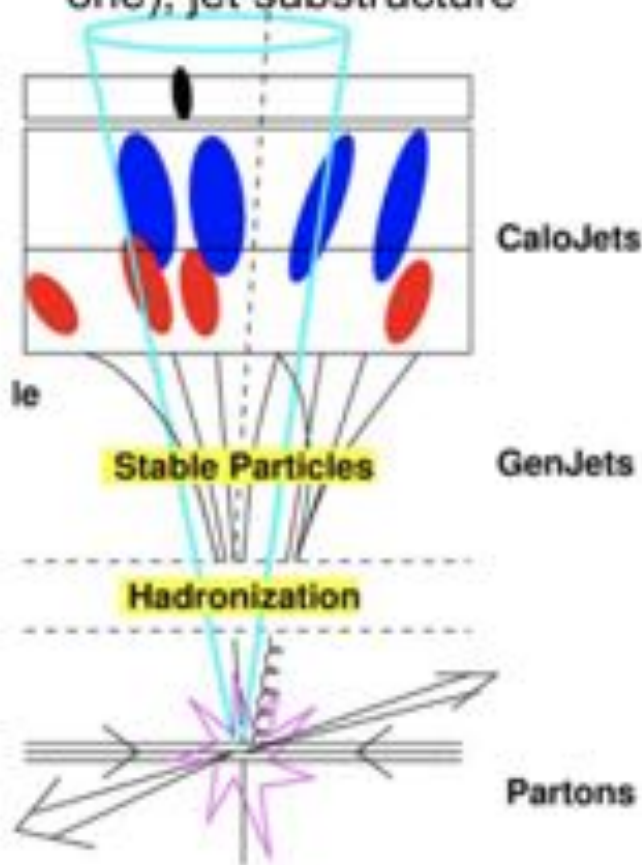

- Dedicated reconstruction/identification algorithms
- Calibrating them is essential

Important to model all these well in simulation

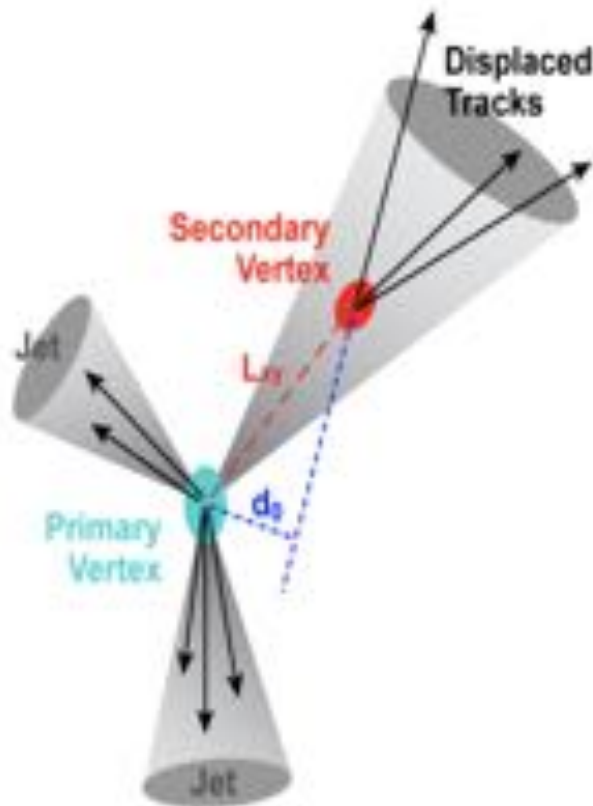

# So how do we study all these particles?

*Some of them are harder to identify/measure*

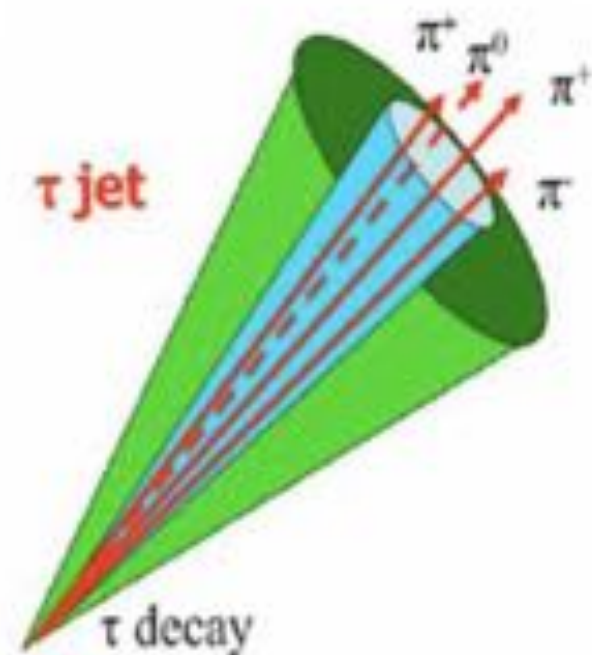

We do not detect **quarks and gluons** but **jets**: different jet algorithms (anti-kT is the common one), jet substructure

**Jets from b-quarks**: b-hadrons fly before decaying this allow us to define advanced identification algorithms

**Tau leptons** decay to hadrons and form jets: usually narrower jets with less tracks

# So how do we study all these particles?

*How do we detect the particles?*

	I	II	III	
Quarks	1.5 GeV u	1.3 GeV c	175 GeV t	Y
	4.2 GeV d	104 GeV s	4.2 GeV b	g
	17 GeV Z			W
Leptons	-1.7 GeV ν <sub>e</sub>	-1.1 GeV ν <sub>μ</sub>	-1.8 GeV ν <sub>τ</sub>	
	0.51 MeV e	105 MeV μ	1.7 GeV τ	H

## Simplified Detector Transverse View

In the transverse plane:

$$\sum \vec{p}_T = 0$$

Missing Transverse Momentum ( $ME_T$ )

*In reality things are much more complicated, but in a simple manner, and for each event*

- $E_{T\text{miss}} = - (E_{T\text{electrons}} + E_{T\text{photons}} + E_{T\text{muons}} + E_{T\text{jets}} + E_{T\text{soft energy not related to an object}})$

**Don't get fooled next time you hear "missing energy". It is actually all the visible (non-missed) energy with a "-" sign in front.. 😊**

# So how do we study all these particles?

## Trigger

We trigger on the physics!

See Giovanni B. and Cristina M.'s talks

# A Higgs boson was discovered in 2012

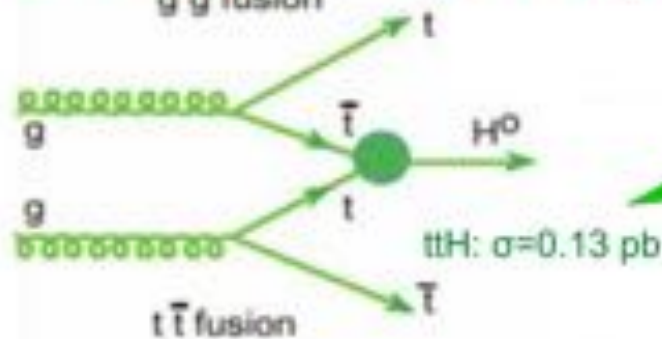

# Higgs is a hot topic in this session

## Higgs production

$ggF: \sigma=19.2 \text{ pb}$

Main production mode at LHC

$t\bar{t}H: \sigma=0.13 \text{ pb}$

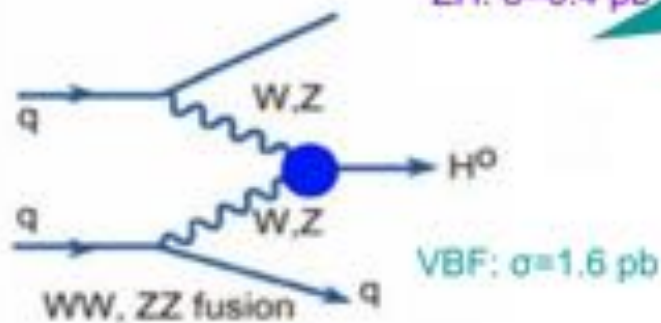

Yukawa coupling

$WH: \sigma=0.7 \text{ pb}$

$ZH: \sigma=0.4 \text{ pb}$

Gauge coupling

$VBF: \sigma=1.6 \text{ pb}$

# Higgs is a hot topic in this session

## Higgs production and decay

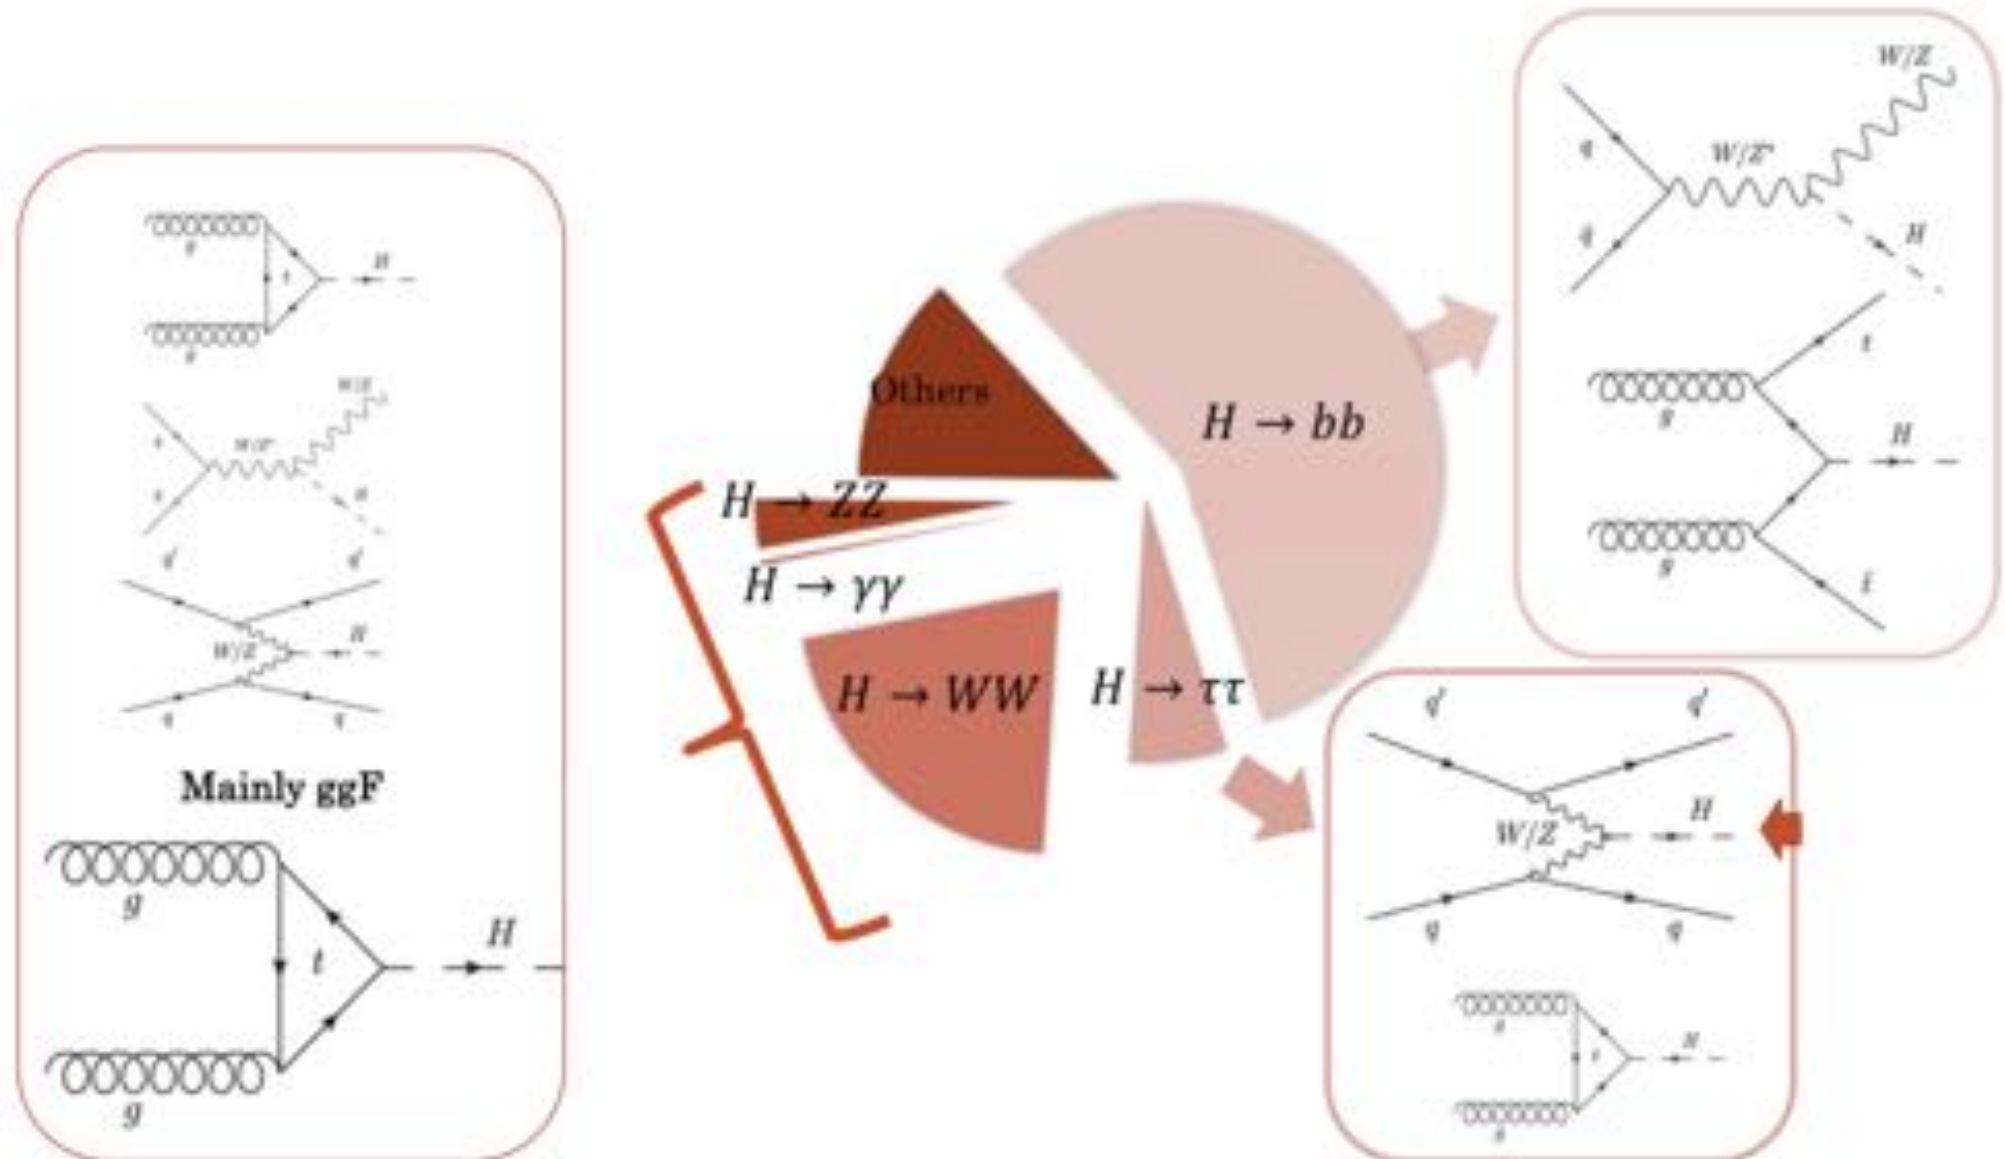

Which production mode or/and decay is the best?

There is an interplay between production and decay based on the backgrounds

# Higgs is a hot topic in this session

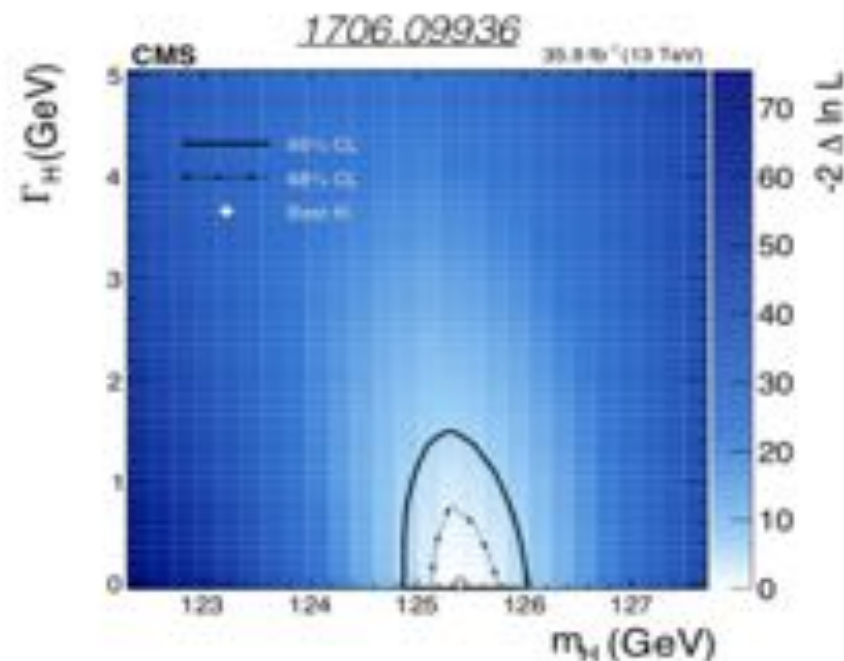

## Higgs production and decay

# Higgs is a hot topic in this session

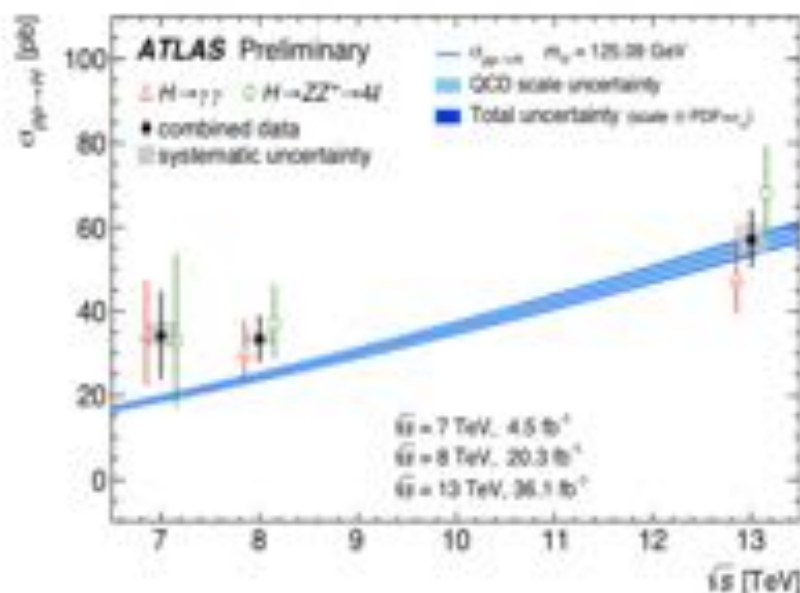

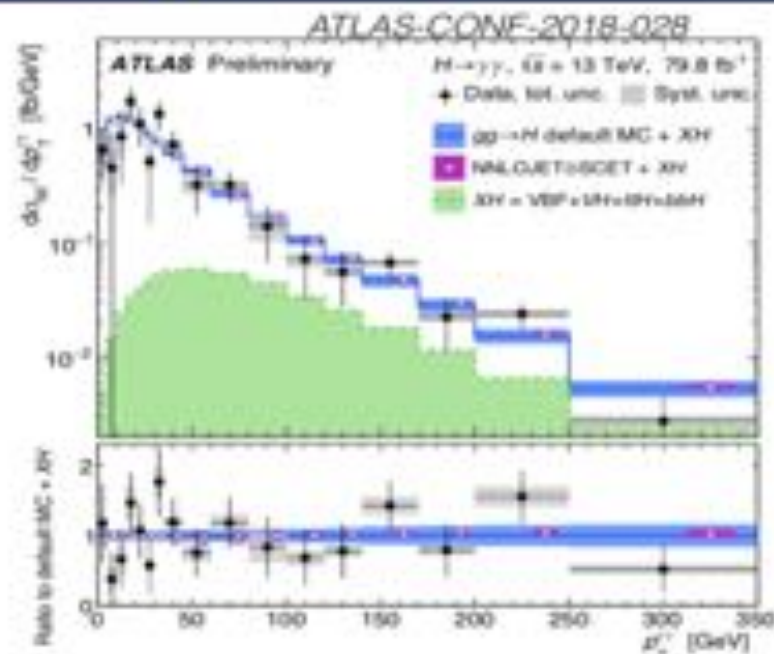

## Higgs production and decay

ZZ, WW and  $\gamma\gamma$  were the first ones to be observed!  
Now we are doing precision measurements with them

CMS 4l channel  
event-by event resolution  
+S/B discriminant  
(3D fit)

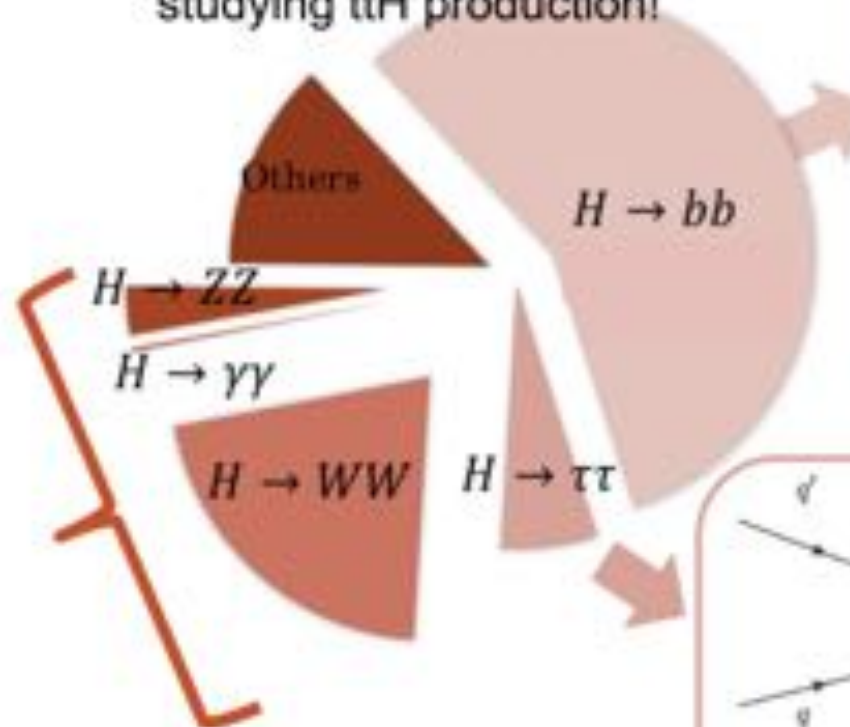

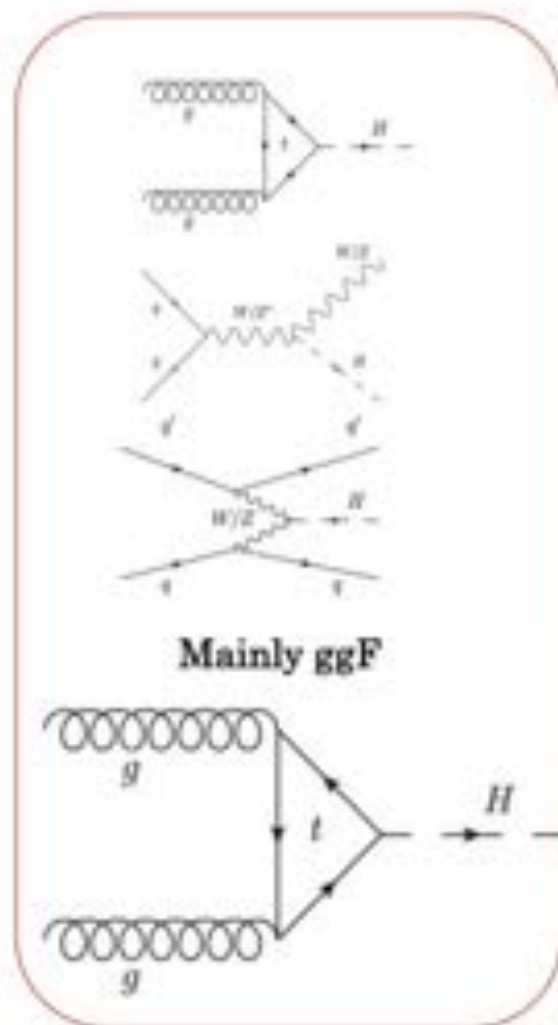

$125.26 \pm 0.21$  GeV  
 $\Gamma_H < 1.1$  GeV (95%CL)

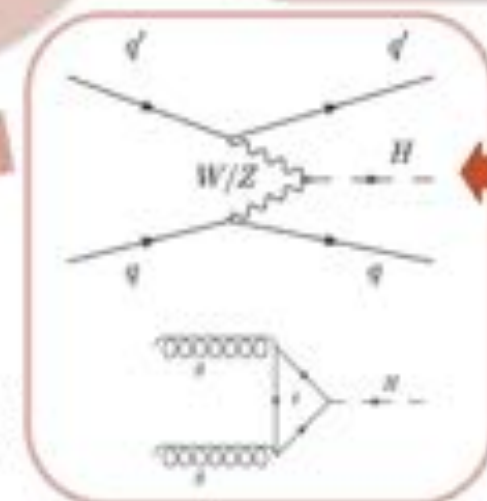

# Higgs is a hot topic in this session

## Higgs production and decay

Decays to b-quarks observed this summer in VH production! We will hear more about how to improve the uncertainties in Konie's talk! And we also have Giovanni, a brave studying ttH production!

Tau decays observed by each experiment independently using 2016 data. See Cristina's talk to know more about ttH ( $H \rightarrow \tau\tau$ )!

# Higgs is a hot topic in this session

## Higgs production and decay

### ttH observation

Combine different decay modes assuming SM for the decay BR

Combine also with run 1 data (lower sensitivity, 20 (5) fb<sup>-1</sup> @ 8(7) TeV)

Expected significance 4.2 (CMS), 5.1 (ATLAS)

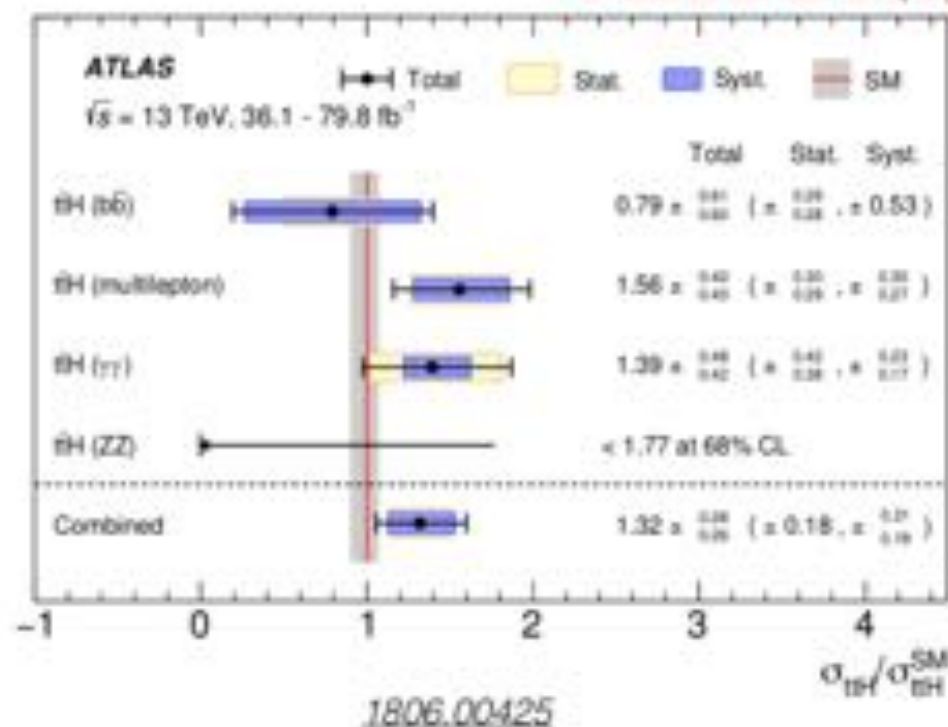

Observed significance 5.2 (CMS), 6.3 (ATLAS)

(note that ATLAS uses 2017 data for ttH, H → gamma gamma and 4l)

Giovanni B. for ttH(bb)

Merve N. for ttH(WW, ZZ, ττ)

Cristina M. for ttH(ττ)

# SM: not only Higgs

July 2018

CMS Preliminary

- Many precision measurements going on on other sectors: top, EWK, etc
- Cross sections, masses, spin, etc
- See Guillaume B. who will talk about the tau spin measurement

# SM: not only Higgs

Standard Model Production Cross Section Measurements

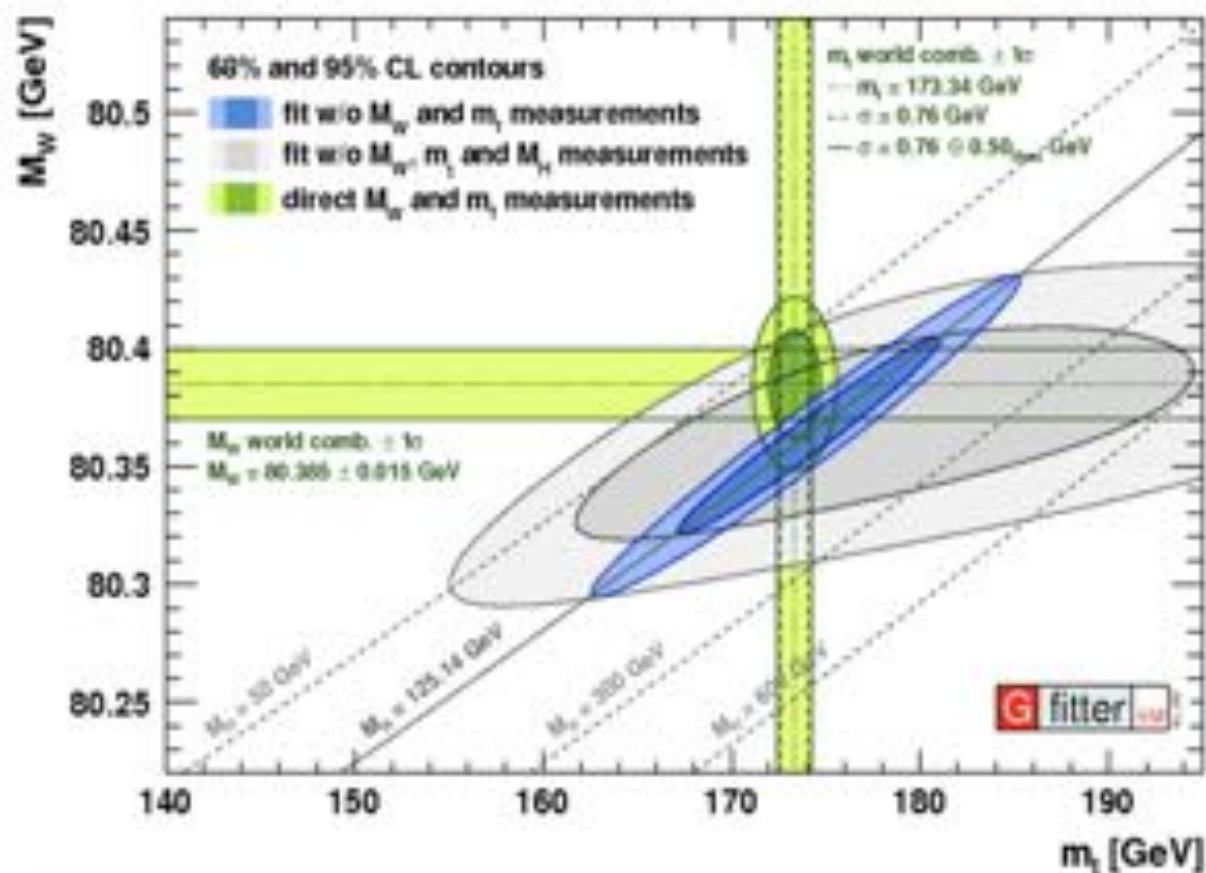

Status: July 2018

- Many precision measurements going on on other sectors: top, EWK, etc
- Cross sections, masses, spin, etc
- See Guillaume B. who will talk about the tau spin measurement

# Coherence tests of the SM

- Many SM measurements
- We can test the coherence of the SM combining those

# Is there something else beyond the SM?

	2.4 MeV	1.3 GeV	170 GeV	0
	u	c	t	$\gamma$
	4.8 MeV	104 MeV	4.2 GeV	0
	d	s	b	g
	<2.2 eV	<0.2 MeV	<16 MeV	91 GeV
	$\nu_e$	$\nu_\mu$	$\nu_\tau$	Z
	0.5 MeV	16 MeV	1.8 GeV	80 GeV
	e	$\mu$	$\tau$	W
				126 GeV
				H

# El Modelo Estándar (MS)

## ¿Una pieza del rompecabeza del universo?

- Tomorrow morning we will discuss about direct searches of new particles/forces
- The SM is a laboratory itself for indirect searches!

**Merci**  
**Gracias**  
**Thanks**

# Backup

# Production modes and decays studied

	Untagged (ggF mostly)	VBF	VH	ttH
observed (run 2)				
investigated				
rare decay				
Combination of decays				
$H \rightarrow \gamma\gamma$				
$H \rightarrow ZZ^* \rightarrow 4l$				
$H \rightarrow WW^* \rightarrow 2l2\nu$				
$H \rightarrow \tau\tau$	(Boosted)			
$H \rightarrow bb$	(Highly Boosted)			
$H \rightarrow uu$				
$H \rightarrow cc$				
$H \rightarrow Z\nu$				
$H \rightarrow$ invisible				

Each decay\*Production mode combination involves usually several analysis categories to improve sensitivity

Main backgrounds usually derived or checked with data control regions

# Top physics

- LHC is a top factory, a lot of measurements of cross section and mass

- Top is the heaviest known particle. If new physics exists, it's expected to couple with the mass
- Top sensitive to new physics**
- Top rare processes  $ttZ$ ,  $ttbb$ , ... are important background for various analyses ( $ttH$ )

July 2018

CMS Preliminary

- **Weak mixing angle extraction @8 TeV**
  - CMS [EPJC 78 \(2018\) 701](#); [ATLAS-CONF-2018-037](#)
- **Triple-differential Drell-Yan @8 TeV**
  - ATLAS [JHEP 12 \(2017\) 059](#)
- **Forward Z  $\rightarrow \tau+\tau^-$  @ 8 TeV**
  - LHCb [arXiv:1806.05008](#)
- **Inclusive WZ production @13 TeV**
  - [ATLAS-CONF-2018-034](#), [CMS-PAS-SMP-18-002](#)
- **Electroweak diboson production @13 TeV**
  - WZ: [ATLAS-CONF-2018-033](#), [CMS-PAS-SMP-18-001](#)
  - ZZ: CMS [PLB 774 \(2017\) 682](#)
  - WW: CMS [PRL 120 \(2018\) 081801](#); [ATLAS-CONF-2018-030](#)
- **$\gamma\gamma \rightarrow ll$  with proton-tagging @13 TeV**
  - CMS+TOTEM [JHEP 1807 \(2018\) 153](#)
- **Light-by-light scattering @5 TeV Pb+Pb**
  - ATLAS [Nature Phys. 13 \(2017\) 852](#); [CMS-PAS-FSQ-16-012](#)
