

# Correlations and collectivity within the Shell Model

Frédéric Nowacki<sup>1</sup>

RESANET GT2 Meeting, October 9th, 2018

---

<sup>1</sup>Strasbourg-Madrid Shell-Model collaboration

# Shell Model Problem

- Define a valence space
- Derive an effective interaction

$$\mathcal{H}\Psi = E\Psi \rightarrow \mathcal{H}_{\text{eff}}\Psi_{\text{eff}} = E\Psi_{\text{eff}}$$

- Build and diagonalize the Hamiltonian matrix.

In principle, all the spectroscopic properties are described simultaneously (Rotational band **AND**  $\beta$  decay half-life).

# Separation of the effective Hamiltonian

## Monopole and multipole

From the work of M. Dufour and A. Zuker (PRC 54 1996 1641)  
Separation theorem:

Any effective interaction can be split in two parts:

$$H = H_{monopole} + H_{multipole}$$

$H_{monopole}$ : *spherical mean-field*

☛ responsible for the global saturation properties and for the evolution of the spherical single particle levels.

$H_{multipole}$ : *correlator*

☛ pairing, quadrupole, octupole...

Important property:

$$\langle CS \pm 1 | H | CS \pm 1 \rangle = \langle CS \pm 1 | H_{monopole} | CS \pm 1 \rangle$$

# Multipole Hamiltonian

$H_{\text{multipole}}$  can be written in two representations, particle-particle and particle-hole. Both can be brought into a diagonal form. When this is done, it comes out that only a few terms are coherent, and those are the simplest ones:

- $L = 0$  isovector and isoscalar pairing
- Elliott's quadrupole
- $\vec{\sigma}\vec{\tau} \cdot \vec{\sigma}\vec{\tau}$
- Octupole and hexadecapole terms of the type  $r^\lambda Y_\lambda \cdot r^\lambda Y_\lambda$

Besides, they are universal (all the realistic interactions give similar values) and scale simply with the mass number

Interaction	particle-particle		particle-hole		
	$JT = 01$	$JT = 10$	$\lambda\tau = 20$	$\lambda\tau = 40$	$\lambda\tau = 11$
KB3	-4.75	-4.46	-2.79	-1.39	+2.46
FPD6	-5.06	-5.08	-3.11	-1.67	+3.17
GOGNY	-4.07	-5.74	-3.23	-1.77	+2.46

# Shell structure and correlations

- at stability
  - double magicity + superdeformed states:  $^{16}\text{O}$ ,  $^{40}\text{Ca}$ ,  $^{56}\text{Ni}$
- far from stability
  - Vanishing of shell closure:  $^{11}\text{Li}$ ,  $^{32}\text{Mg}$ ,  $^{42}\text{Si}$ ,  $^{68}\text{Ni}$ ,  $^{80}\text{Zr}$  ...
  - New gaps:  $^{24}\text{O}$ ,  $^{54}\text{Ca}$  ...

Interplay between

- Monopole field (spherical mean field)
- Multipole correlations (pairing, Q.Q, ...)

*“Pairing plus Quadrupole propose, Monopole disposes”*

A. Zuker, Coherent and Random Hamiltonians, CRN Preprint 1994

For the Monopole field itself,

interplay between

- single particle field
- two-body interaction (T=1, T=0)

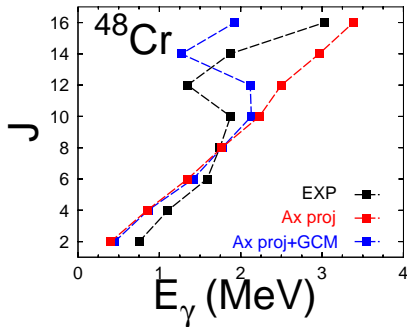

# Spherical Shell Model and Deformation

- nuclear shell model often considered to be applied only when nuclear manifestations are dominated by single particle degrees of freedom
- BUT work of Elliot: deformation in light nuclei explained by algebraic SU3 model
- Limitations of SU3 model:
  - as the spin orbit term becomes rapidly important its applicability stops at the sd shell
  - but can be recovered approximately as in the pseudo-SU3 or quasi-SU3 schemes.

See:

Phys. Rev. **C52** (1995) R1741
- A. P. Zuker, A. Poves, F. Nowacki and S. M. Lenzi  
Phys. Rev. **C92** (2015) 024302

# Correlations: $^{48}\text{Cr}$ example

Deformed HF versus SM diagonalisation

# Extreme Correlations: the case of $^{40}\text{Ca}$

In the valence space of two major shells

# Extreme Correlations: the case of $^{40}\text{Ca}$

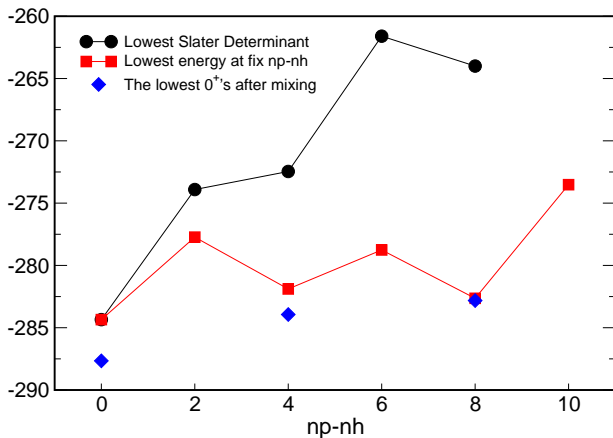

The relevant configurations are:

- $[sd]^{24}$       0p-0h in  $^{40}\text{Ca}$ , **SPHERICAL**
- $[sd]^{20}[pf]^4$       4p-4h in  $^{40}\text{Ca}$ , **DEFORMED**
- $[sd]^{16}[pf]^8$       8p-8h in  $^{40}\text{Ca}$ , **SUPERDEFORMED**

# Huge correlation energies!!!

*sd* – *pf* space diagonalisation

- quasi-particle gap  $\sim 7$  MeV
- few mixing between  $0p0h$  and  $2p2h$ , few mixing between  $4p4h$  and  $6p6h$
- no mixing (through  $2p2h$  states) between GS and SD band
- energy gain mainly for ground state

# Quasi-SU3 + Pseudo-SU3 interpretation

In the 4p-4h intrinsic state of  $^{40}\text{Ca}$ , the two neutrons and two protons in the  $pf$ -shell can be placed in the lowest  $K=1/2$  quasi-SU3 level of the  $p=3$  shell. This gives a contribution  $Q_0=25 \text{ b}^2$ . In the pseudo-p shell  $p=1$  we are left with eight particles, that contribute with  $Q_0=7 \text{ b}^2$ . For the 8p-8h state the values are  $Q_0=35 \text{ b}^2$  and  $Q_0=11 \text{ b}^2$

Using the proper values of the oscillator length it obtains:

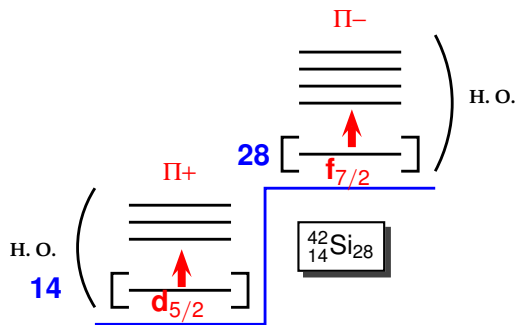

$^{40}\text{Ca}$  4p-4h band  $Q_0=125 \text{ e fm}^2$  ( $Q_0=148 \text{ e fm}^2$ )

$^{40}\text{Ca}$  8p-8h band  $Q_0=180 \text{ e fm}^2$  ( $Q_0=226 \text{ e fm}^2$ )

In very good accord with the data. The values in blue assume strict SU3 symmetry in both shells. The SM results almost saturate the quasi-SU3 bounds. The SU3 values are a 25% larger.

# Spin-orbit shell closure far from stability

- sd-pf:  $^{42}\text{Si}$  deformed

- pf-sdg:  $^{78}\text{Ni}$  ???

- sdg-phf:  $^{132}\text{Sn}$  doubly magic

- Evolution of  $Z=14$  from  $N=20$  to  $N=28$

- Evolution of  $Z=28$  from  $N=40$  to  $N=50$

- Evolution of  $N=50$  from  $Z=40$  to  $Z=28$

# Spin-orbit shell closure far from stability

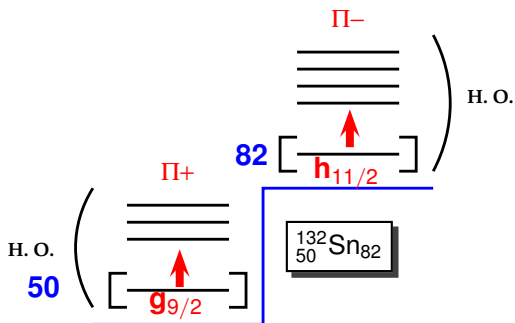

- sd-pf:  ${}^{42}\text{Si}$  deformed
- pf-sdg:  ${}^{78}\text{Ni}$  ???
- sdg-phf:  ${}^{132}\text{Sn}$  doubly magic

- Evolution of  $Z=14$  from  $N=20$  to  $N=28$
- Evolution of  $Z=28$  from  $N=40$  to  $N=50$
- Evolution of  $N=50$  from  $Z=40$  to  $Z=28$

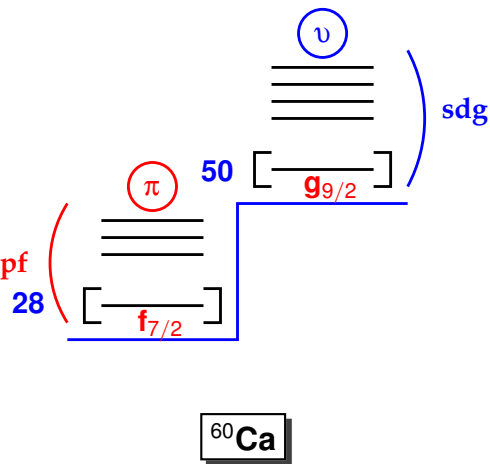

# Spin-orbit shell closure far from stability

- sd-pf:  $^{42}\text{Si}$  deformed
- $^{78}\text{Ni}$  ???
- pf-sdg: sdg-phf:  
 $^{132}\text{Sn}$  doubly magic

- Evolution of  $Z=28$  from  $N=40$  to  $N=50$
- Evolution of  $N=50$  from  $Z=40$  to  $Z=28$

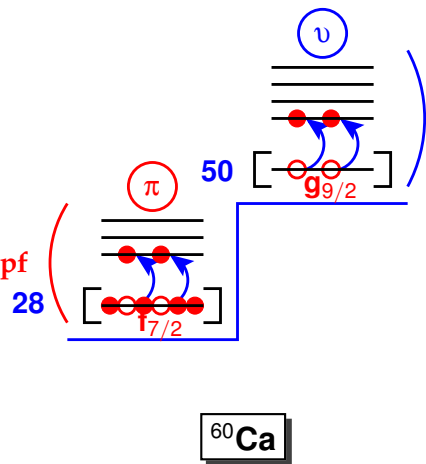

## PFSDG-U interaction:

- realistic TBME
- pf shell for protons and gds shell for neutrons
- monopole corrections ( 3N forces )
- proton and neutrons gap  $^{78}\text{Ni}$  fixed to phenomenological derived values

## Calculations:

- excitations across Z=28 and N=50 gaps
- up to  $5 \cdot 10^{10}$  Slater Determinant basis states
- up to  $3 \cdot 10^{13}$  non-zero terms in the matrix!
- m-scheme code ANTOINE (non public version)
- J-scheme code NATHAN (parallelized version):  $0.5 \cdot 10^9$  J basis states

# Physics around $^{78}\text{Ni}$

## PFSDG-U interaction:

## Nilsson-SU3 self-consistency in heavy $N = Z$ nuclei

A. P. Zuker,<sup>1</sup> A. Poves,<sup>2,3</sup> F. Nowacki,<sup>1</sup> and S. M. Lenzi<sup>4</sup>

- monopole + quadrupole model
- proton gap (5MeV) and neutron gap (5 MeV) estimates
- Quasi-SU3 (protons) and Pseudo-SU3 (neutrons) blocks
- $Q_s = (\langle 2q_{20} \rangle + 3.)b^2/3.5$
- $E_n = G_n^{mp}(50) - \hbar\omega\kappa \left( \frac{\langle Q_0^m(\pi) \rangle}{15 b^2} + \frac{\langle Q_0^m(\nu) \rangle}{23 b^2} \right)^2$
- $G_n^{mp}(50) = n \left( \frac{3.0}{8} n_f^\pi + 2.25 \right) + \Delta(n) + \delta_\rho(n)$
- Prediction of Island of strong collectivity below  $^{78}\text{Ni}$  !!!

# Shape coexistence in $^{78}\text{Ni}$

- At first approximation,  $^{78}\text{Ni}$  has a double closed shell structure for GS
- But very low-lying competing structures
- From the diagonalization, the first excited states in  $^{78}\text{Ni}$  are :
  - $0_2^+ - 2_1^+$  predicted at 2.6-2.9 MeV and to be deformed intruders of a **rotationnal band** !!!
- “ $1p1h$ ”  $2_2^+$  predicted at  $\sim 3.1$  MeV
- Necessity to go **beyond** ( $fpg_{9/2} d_{5/2}$ ) LNPS space and **beyond ab-initio description**
- Portal to a new **Island of Inversion**
