# OUTLINE

#### COLIBRI: A GROUND FOLLOW-UP TELESCOPE FOR SVOM Overview Requirements Software development

#### COLIBRI'S SENSITIVITY

#### ESTIMATION OF PHOTO-Z ACCURACY Photo-z method Photo-z algorithm validation

- Mock samples
- Results

Overview Requirements Software development

# **OVERVIEW**

- Observatory availability: 90%
- Median seeing: about 0.8"
- Primary mirror: 1.3m
- ▶ Delay for pointing: ≤ 30 seconds (goal: 20s)
- Dedicated follow-up telescope for SVOM
- 2 (goal 3) simultaneous arms:
  - FoV: 26' in VIS, 21.7' in NIR
  - spectral coverage: 400-1700 nm

Overview Requirements Software development

# **OVERVIEW**

- Observatory availability: 90%
- Median seeing: about 0.8"
- Primary mirror: 1.3m
- ▶ Delay for pointing: ≤ 30 seconds (goal: 20s)
- Dedicated follow-up telescope for SVOM
- 2 (goal 3) simultaneous arms:
  - FoV: 26' in VIS, 21.7' in NIR
  - spectral coverage: 400-1700 nm

Overview Requirements Software development

# MAIN REQUIREMENTS

- Precision of localisation: < 0.5"</p>
- Limiting magnitude:
  - 30s: R=19.2, J=18 (AB mag)
  - 5min: R=22, J=20 (AB mag)
- Delivering redshift estimation 5 minutes after start of observations

Overview Requirements Software development

#### END-TO-END SOFTWARE

- GRB light curve modelling: Empirical and synchrotron model
- Exposure Time Calculator: T<sub>exp</sub>, SNR, limiting magnitude
- Image Simulator: insert GRB in realistic FoV
- Photometric redshift code
- open source

Overview Requirements Software development

# EXPOSURE TIME CALCULATOR

- Compute T<sub>EXP</sub>, SNR, limiting magnitude
- Transmission of each optical element
- Detector characteristics
- Easily adaptable to other telescopes
- Developed to
  - compare different instrument designs
  - observation preparation tool

2019 LIA France-Mexico

2019/06/04

COLIBRI scientific performances

Overview Requirements Software development

# IMAGE SIMULATOR

#### Realistic Point Spread Functions

- Querying astronomical sources catalogues
- Position a GRB in realistic FoV
- Easily adaptable to other telescopes
- Developed to feed and test the reduction pipeline

# ILLUSTRATION FOR GRB 170817A

#### COLIBRI: A GROUND FOLLOW-UP TELESCOPE FOR SVOM

2019 LIA France-Mexico

# **SCIENTIFIC PERFORMANCES: 2/3**

- Limiting magnitudes requirement satisfied
- at least 2.5 mag deeper at early times compared to previously detected GRBs

#### **S**CIENTIFIC PERFORMANCES: 3/3

Ability to detect high-z, dusty GRB: GRB 080607 with  $A_V \sim 2.33$  mag at z=3.03

#### STACK OF 30s exposures

#### COLIBRI: A GROUND FOLLOW-UP TELESCOPE FOR SVOM

COLIBRI'S SENSITIVITY

ESTIMATION OF PHOTO-Z ACCURACY

Photo-z method Photo-z algorithm validation Mock samples Results

# Рното-z: Метнор

#### METHOD

MCMC algorithm based on detection of spectral signatures: Ly- $\alpha$  transition and Lyman break at 1216×(1+z) and 912×(1+z) Å

#### ILLUSTRATION

- $F_{mod} = F_0 \times (\frac{\lambda}{\lambda_0})^{\beta} \times exp \left[ -\tau_{dust}(z, A_V^{host}) \tau_{IGM}(z) \right) \right]$
- F<sub>0</sub>= 1 mJy ,  $\beta$ =0.66, MW extinction curve with  $A_V$ =0.5 mag, only redshift varies

Photo-z method Photo-z algorithm validation Mock samples Results

Photo-z method Photo-z algorithm validation Mock samples Results

# MOCK SAMPLE

#### GOAL

Estimate photometric redshift accuracy on a GRB mock sample

- ▶ 625 GRBs spanning 0 < z < 10</p>
- 25% GRBs with A<sub>V</sub> > 1 mag
- Other parameters randomly drawn from distributions based on real observations

Photo-z method Photo-z algorithm validation Mock samples Results

### **GRB** LIGHT CURVE MODELLING

#### **GRB** INTRINSIC EMISSION

EMPIRICAL MODEL

 $F_{em}(\lambda, t, \beta, \alpha) = F_0 \times (\frac{\lambda}{\lambda_0})^{\beta} \times (\frac{t}{t_0})^{\alpha}$ 

#### THEORETICAL MODEL

- Synchrotron model (Granot & Sari 2002)
- Governed by 7 parameters:
  - t: time
  - z: GRB redshift
  - ► *E*<sub>52</sub>: total energy in the shell
  - p: index e- power-law distribution
  - $\epsilon_B$ : fraction shock energy  $\Rightarrow$  B
  - $\epsilon_e$ : fraction shock energy  $\Rightarrow$  e-
  - n<sub>0</sub>: particle density

#### FLUX ATTENUATION ALONG GRB L.O.S

Dust in Host galaxy + Inter Galactic Medium

$$\blacktriangleright F_{obs}(\lambda, t, \beta, \alpha, A_V, z) = F_{em}(\lambda, t, \beta, \alpha) \times exp\left[-\tau_{dust}(z, A_V^{host}) - \tau_{IGM}(z))\right]$$

# MOCK SAMPLE RESULTS

Photo-z method Photo-z algorithm validation Mock samples Results

# SUMMARY

- Development of an end-to-end software to assess COLIBRI's sensitivity. (Adaptable to other optical/NIR telescopes)
- Development of a Bayesian photometric redshift code validated on real GRB SEDs
- COLIBRI's design fulfils requirements on sensitivity
- Relative accuracy on z<sub>phot</sub>:
  - 3.5 < z < 8: about 10%</p>
  - z > 8: about 14%
- Due to its sensitivity and very rapid follow-up, COLIBRI will routinely detect GRBs suffering a high amount of visual extinction.
