Upgraded Belle II detector

Better particle identification, higher coverage...

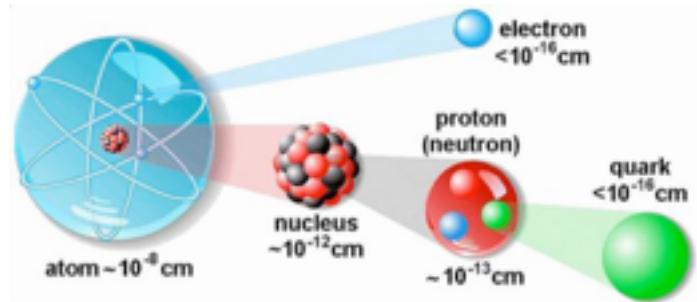

Timeline of Flavour Physics

Competition/Complementarity between Belle II vs LHCb

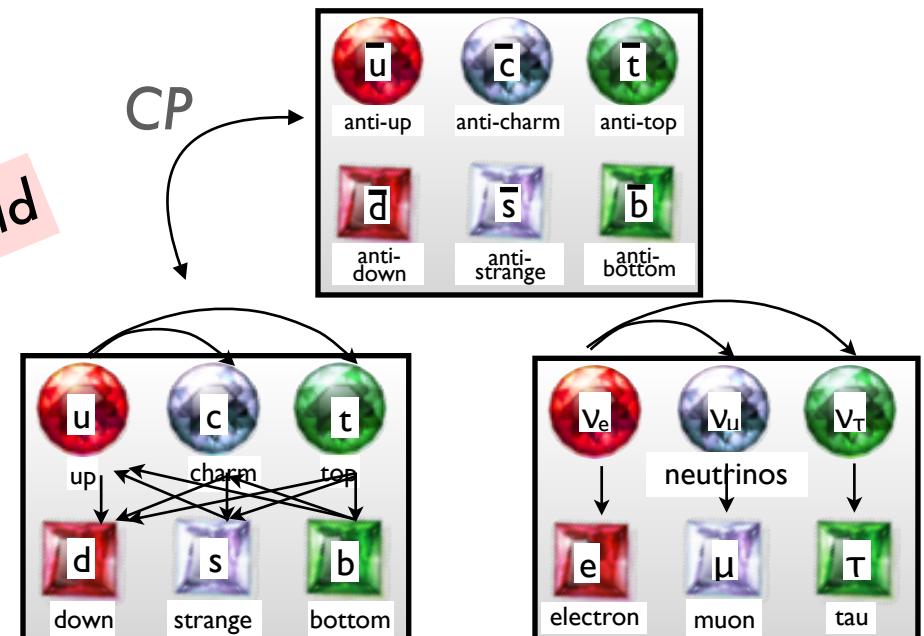

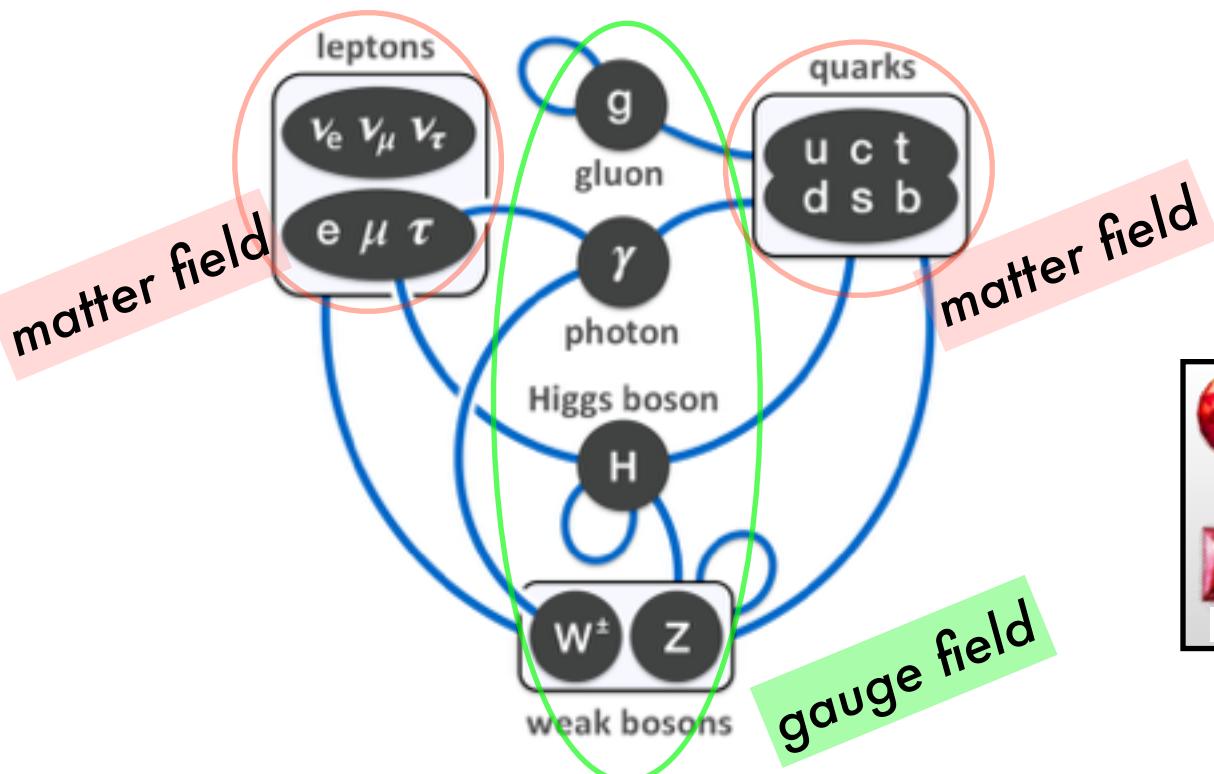

Searching new physics in flavour
physics

Flavour physics

- Investigating the fundamental interaction through transitions among different **quarks and leptons**
- The CP violation** is one of the most interesting phenomena in flavour physics

Flavour Physics within SM

In SM, the difference between mass and interaction basis explains, the GIM mechanism, the CP Violation! Very concise!

$$\mathcal{L}_Y = \sum_{ij} Y_{ij}^u \overline{Q}_{iL} \begin{pmatrix} \phi^0 \\ \phi^- \end{pmatrix} u_{jR} + \sum_{ij} Y_{ij}^d \overline{Q}_{iL} \begin{pmatrix} -\phi^{-\dagger} \\ \phi^{0\dagger} \end{pmatrix} d_{jR} + h.c.$$

Yukawa coupling

Glashow, Illiopolous, Maiani '70

$$(U_{L,R}^u)^\dagger U_{L,R}^u \equiv 1, \quad (U_{L,R}^d)^\dagger U_{L,R}^d \equiv 1$$

Flavour changing neutral current suppression

Cabibbo '63
Kobayashi, Maskawa '73

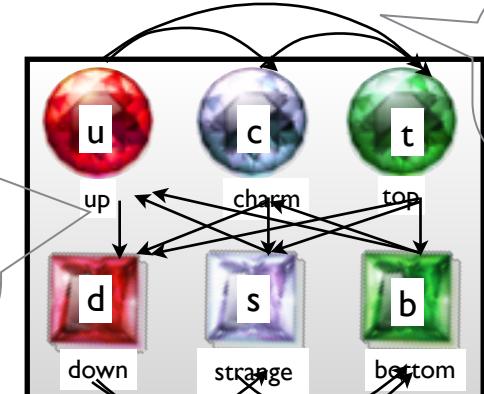

$$(U_L^u)^\dagger U_L^d \equiv V_{CKM}$$

Charged current: CKM matrix
Origin of CP Violation
(complex phase)!

Cronin, Fitch, Christenson, Turlay '64

Vckm: Cabibbo-Kobayashi-Maskawa matrix

FCNC suppressed

What has been confirmed?

Observed Quark masses

	1st generation	2nd generation	3rd generation
up type charge 2/3	up $2.2 \pm 0.5 \text{ MeV}$	charm $1.27 \pm 0.03 \text{ GeV}$	top $173.21 \pm 0.87 \text{ GeV}$
down type charge -1/3	down $4.7 \pm 0.5 \text{ MeV}$	strange $96 \pm 6 \text{ MeV}$	bottom $4.18 \pm 0.04 \text{ GeV}$
charged lepton charge -1	electron 0.511 MeV	μ 105.7 MeV	τ 1.78 GeV
neutrinos charge 0	ν_e $< 2.0 \text{ eV}$	ν_μ $< 0.17 \text{ eV}$	ν_τ $< 18.2 \text{ eV}$

Observed Quark mixing V_{CKM}

	down	strange	bottom

charm	V_{cd} 0.220 ± 0.005	V_{cs} 0.995 ± 0.016	V_{cb} 0.0405 ± 0.0015
top	V_{td}	V_{ts}	V_{tb} 1.009 ± 0.031

✓ SM does not say anything about the Yukawa coupling so the masses and the couplings are not predictable.

✓ **V_{CKM} has to be a 3×3 unitary matrix which includes only one complex phase.**

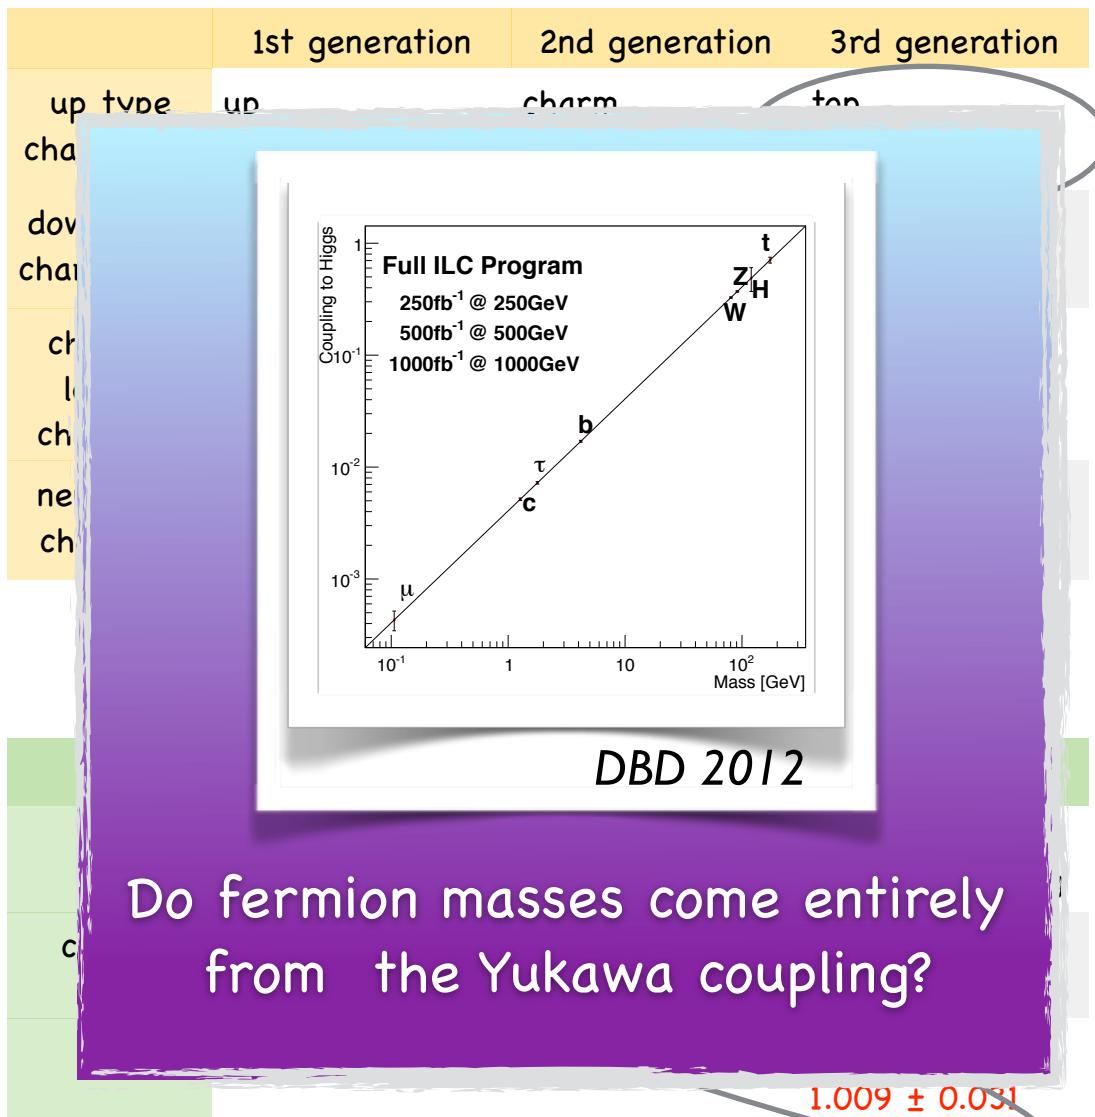

✓ N.B. LHC and LCs can tell us the linearity of the masse and the Higgs coupling.

V_{CKM} : Cabibbo-Kobayashi-Maskawa matrix

What has been confirmed?

Observed Quark masses

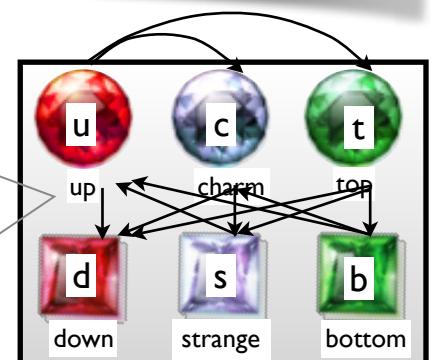

✓ SM does not say anything about the Yukawa coupling so the masses and the couplings are not predictable.

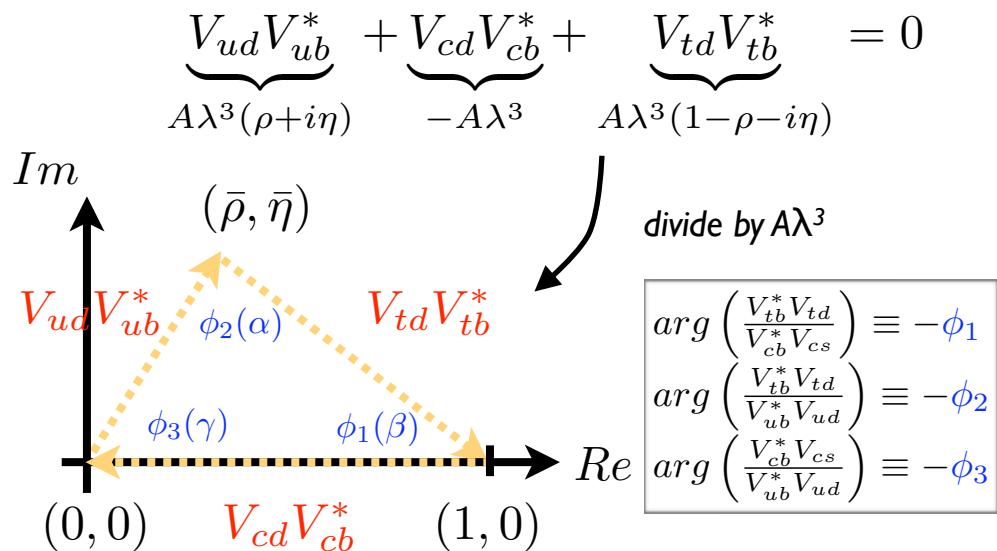

✓ **V_{CKM} has to be a 3x3 unitary matrix which includes only one complex phase.**

✓ N.B. LHC and LCs can tell us the linearity of the masses and the Higgs coupling.

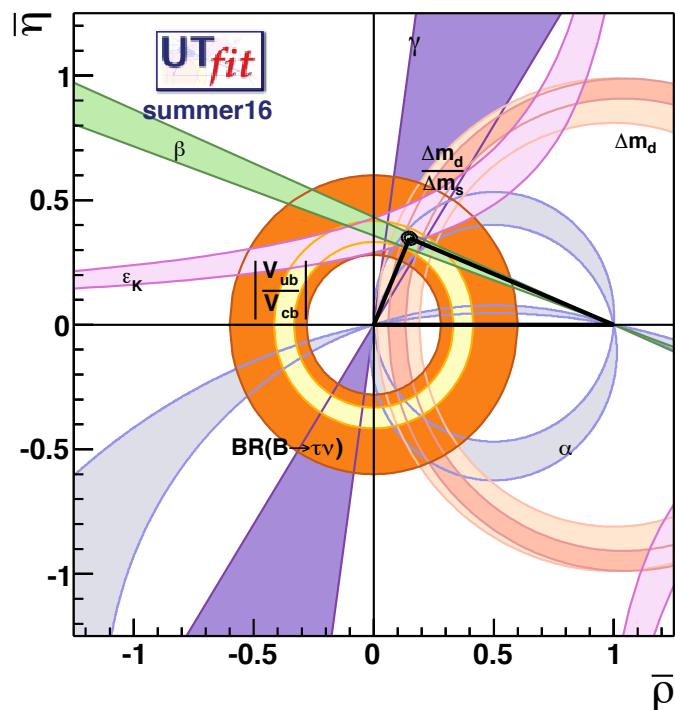

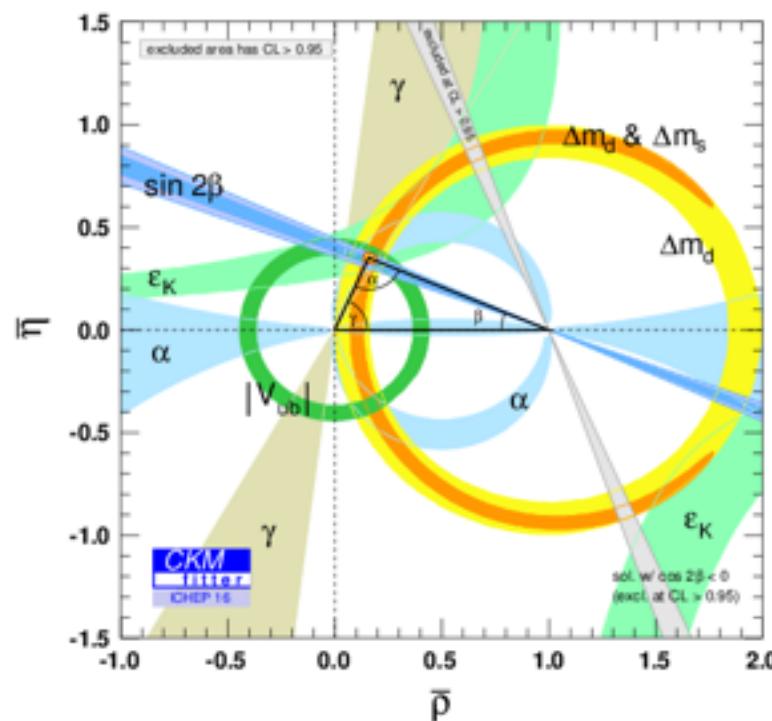

V_{CKM}: Cabibbo-Kobayashi-Maskawa matrix

The Unitarity triangle: test of Unitarity?

► **Successful explanation** of flavour physics up to now!
Hundreds of observables (including dozens of CPV) are explained by this single matrix.

Flavour Physics beyond SM

The indirect search of new physics through quantum effect: very powerful tool to search for new physics signal!

- ▶ This very simple picture does not exist in most of the extensions of SM: suppression of the FCNC is NOT automatic and also CP violation parameters can appear.
N.B.: SM also has an “unwanted” CP parameter (strong CP problem).

SUSY: Quark and Squark mass matrices can not be diagonalized at the same time ---> FCNC and CP violation

Mutli-Higgs model, Left-Right symmetric model:
Many Higgs appearing in this model ---> tree level FCNC and CP violation

Warped extra-dimension with flavour in bulk:
Natural FCNC suppression though, K-K mixing might be too large due to the chiral enhancement

Flavour Physics beyond SM

The indirect search of new physics through quantum effect: very powerful tool to search for new physics signal!

- ▶ This very simple picture does not exist in most of the extensions of SM: suppression of the FCNC is NOT automatic and also CP violation parameters can appear.

dimensional
with

New
particle introduces new source
of flavour/CP violations. Then, if new
physics exist, we should observe those
phenomena at some point!

The strategies...

Strategy for discovery via precision

Discovery by the intensity frontier experiments.

Reducing uncertainties = probing higher energies

Δ_{NP} = Deviation from SM

$$= (\text{exp.} - \text{SM}) \pm \sqrt{(\sigma_{\text{exp}})^2 + (\sigma_{\text{SM}})^2}$$

$$= c / (M_{NP})^n$$

WE WANT
5-7 σ
DEVIATION !!

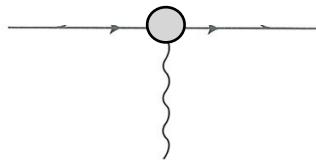

new physics coupling c , new physics scale M_{NP}

E.x. muon g-2

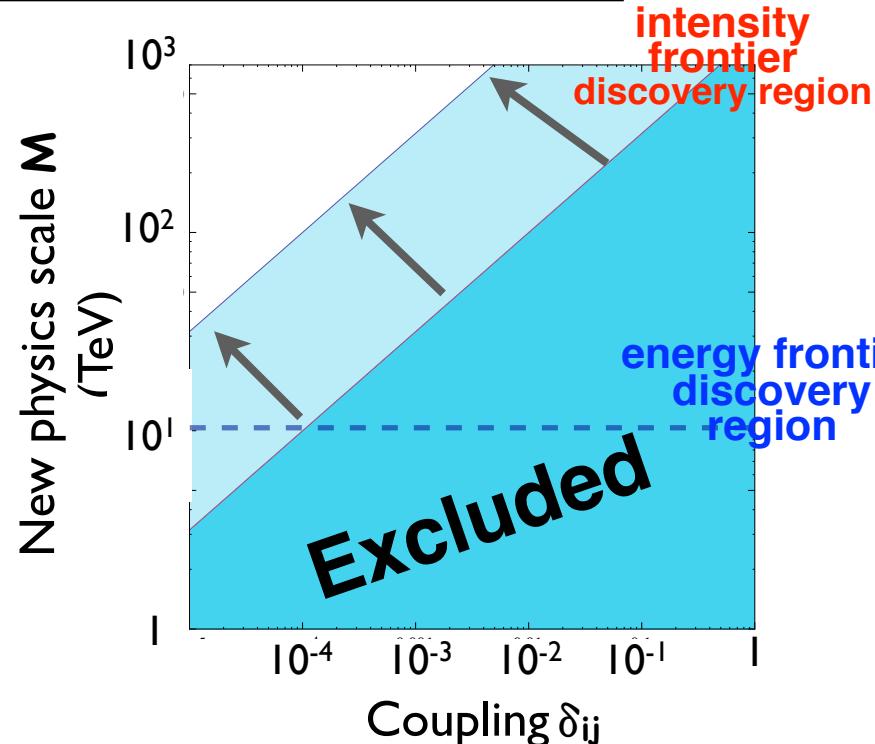

3.6 σ effect!

$$a_\mu^{\text{exp.}} = 11659 \textcolor{red}{2091}(54)(33) \times 10^{-11} .$$

$$a_\mu^{\text{the.}} = 11659 \textcolor{red}{1803}(1)(42)(26) \times 10^{-11}$$

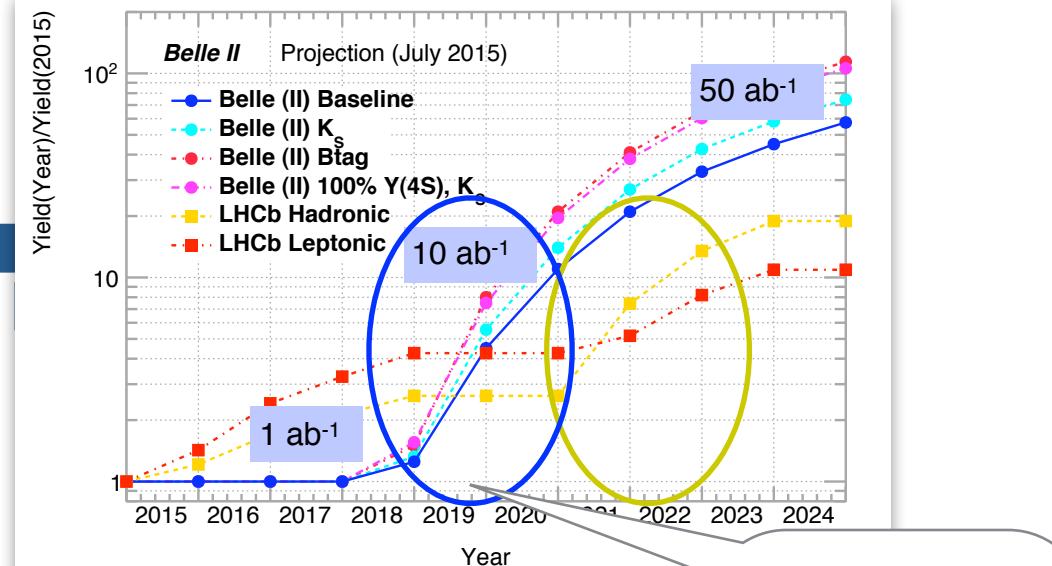

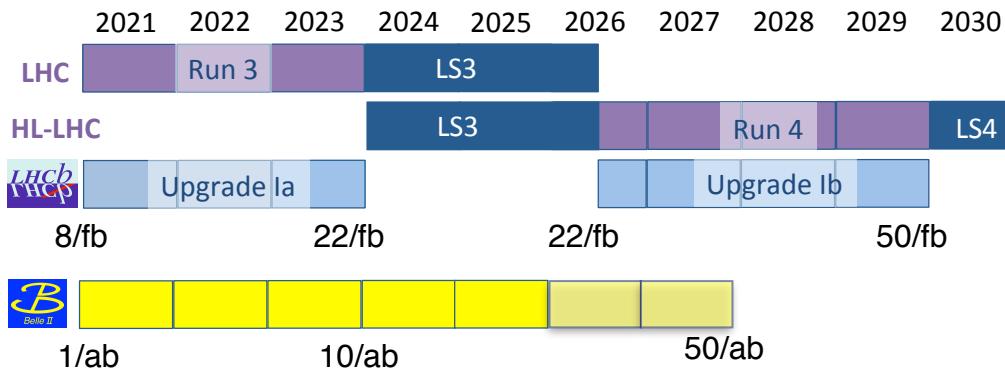

$$\frac{e}{M} \bar{\psi} \sigma_{\mu\nu} \psi F^{\mu\nu}$$

Strategy I: reducing experimental uncertainties

$$\Delta_{NP} = (\text{exp.} - \text{SM}) \pm \sqrt{(\sigma_{\text{exp}})^2 + (\sigma_{\text{SM}})^2}$$

Future increase of the luminosity in Heavy Flavour physics

Breakthrough
possible!

- ▶ Belle II increases the luminosity (**50 times** by 2027)
- ▶ **Hadronic channels** become available after LHCb upgrade (starting 2021)
- ▶ Reducible systematic errors can also be reduced as statistics increases

Strategy I: reducing experimental uncertainties

► Many statistical uncertainties become at a few per-cent level: increasing number of systematic uncertainties (of order of a few per-mill !) are to be taken into account.

Observable	LHCb 2018	Upgrade (50 fb ⁻¹)
$2\beta_s(B_s^0 \rightarrow J/\psi\phi)$	0.025	0.008

an “odd case” ?

~2027

If the central

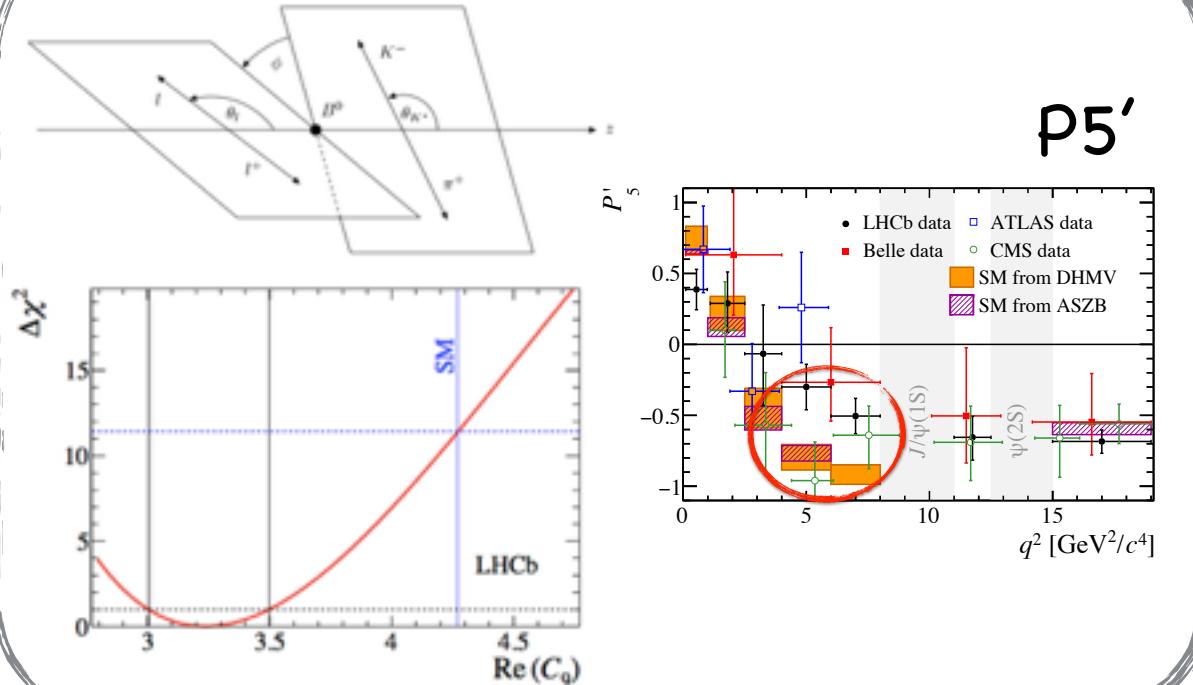

- To understand this “ 7σ ” effect better, we have run a Monte Carlo simulation.
- We randomly sample the central values (1000 trials) assuming Gaussian measurements and compute the significance.
- The result shows that the chance to observe deviation more than 7σ significance is currently 20% !

E.K. & F. Le Diberder for B2TiP working group

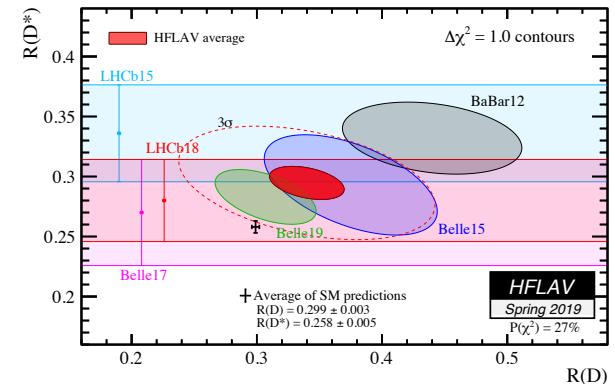

Near future of flavour physics...

LHCb/Babar anomalies and theory?

$B \rightarrow K^* \mu^+ \mu^-$: $\text{Re}(C_9)$ ($\sim 3\text{-}4\sigma$)

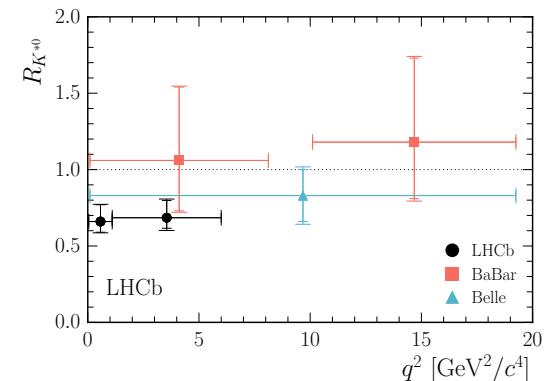

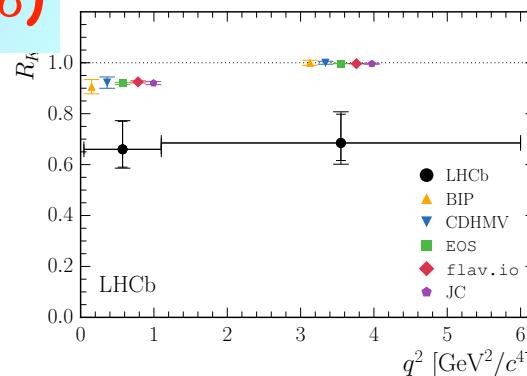

$B \rightarrow D^* \tau \nu / B \rightarrow D^* \bar{\tau} \nu$: $R(D^*)$ ($\sim 3\sigma$)

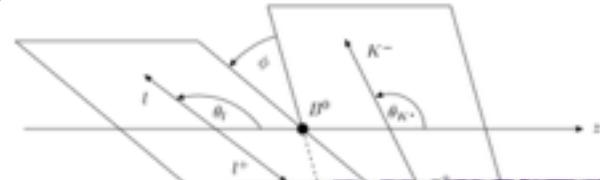

$B \rightarrow K^* e^+ e^- / K^* \mu^+ \mu^-$: $R(K^*)$ ($\sim 2\sigma$)

	low- q^2	central- q^2
$R_{K^{*0}}$	$0.66^{+0.11}_{-0.07} \pm 0.03$	$0.69^{+0.11}_{-0.07} \pm 0.05$
95.4% CL	[0.52, 0.89]	[0.53, 0.94]
99.7% CL	[0.45, 1.04]	[0.46, 1.10]

LHCb/Babar anomalies and theory?

$B \rightarrow K^* \mu^+ \mu^-$: $\text{Re}(C9)$ ($\sim 3\text{-}4\sigma$)

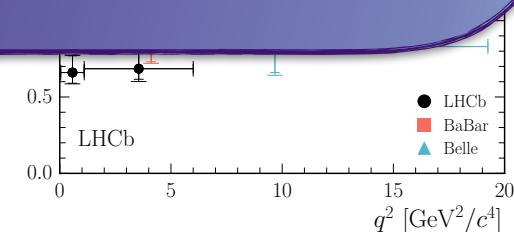

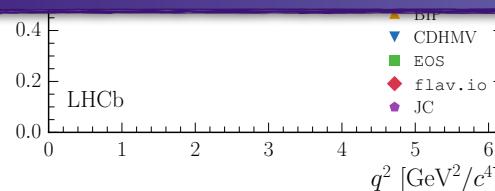

P5'

$B \rightarrow D^* \tau \nu / B \rightarrow D^* \bar{\tau} \nu$: $R(D^*)$ ($\sim 3\sigma$)

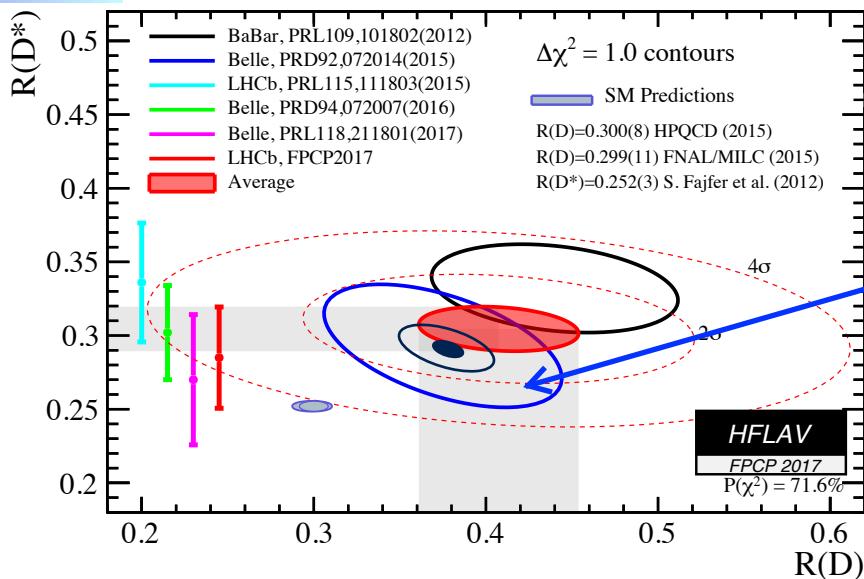

- Very convincing signals.
- SM uncertainties in $B \rightarrow K^* \mu^+ \mu^-$ to be further scrutinised.
- Many model independent studies (e.g. global fit of the effective couplings) are ongoing.
- The appearance of the anomaly implies a very “flavour/Dirac structure specific” new physics.

95.4% CL	[0.52, 0.89]	[0.53, 0.94]
99.7% CL	[0.45, 1.04]	[0.46, 1.10]

What Belle II could tell us?

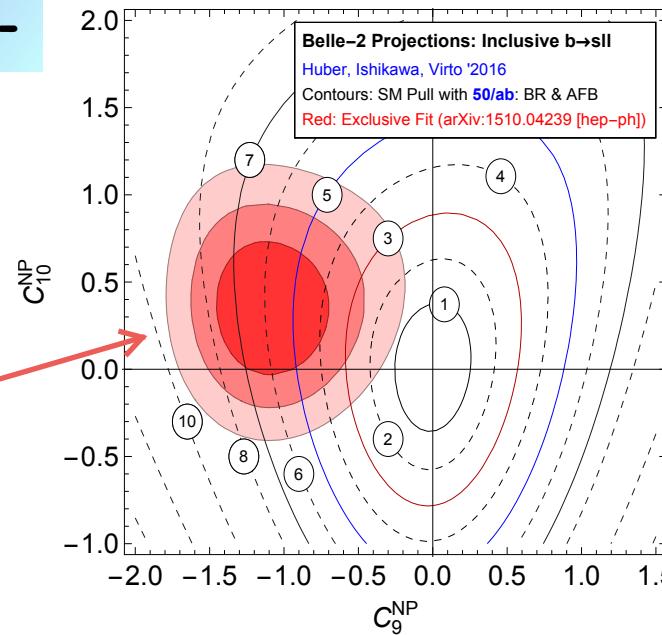

$R(D^{(*)})$

arXiv:1808.10567 (PTEP 2019)
Belle II Physics Book

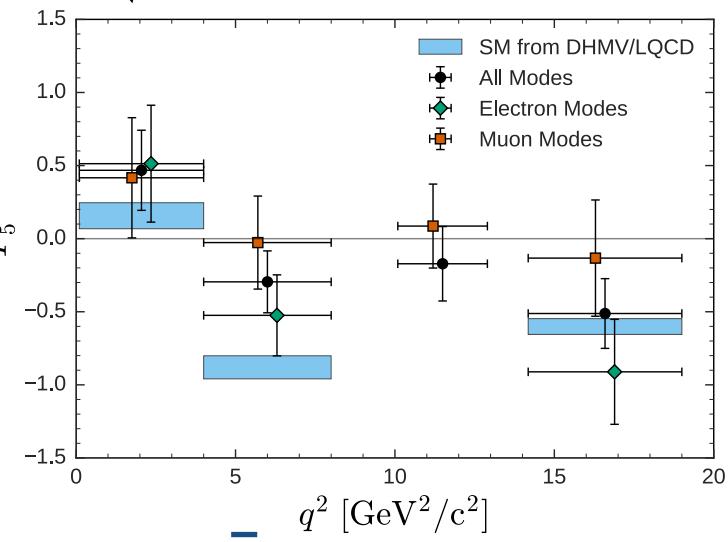

Belle II prospect
(with the current Belle '15 central value)
14(6)σ deviation with 50(10) ab⁻¹ of data!

$b \rightarrow s\mu^+\mu^-/e^+e^-$

Belle II confirmation
via inclusive channel.

High sensitivity both to
 $\mu^+\mu^-/e^+e^-$ channels

Conclusions

- The coming years are very exciting for flavour physics: the startup of Belle II and the upgrades of LHCb will improve the sensitivity to new physics drastically.
- Even for the processes, which were claimed in the previous generation experiment as “consistent to SM”, may show some deviations. **Many breakthrough towards “going beyond the SM” is possible!**
- **The LHCb anomalies are very intriguing.** It was unexpected but many interpretations have been made. **A confirmation by Belle II experiment can be done** in a few years time (at $\sim 10 \text{ ab}^{-1}$).
- Theoretically, what we are looking for seems to be **“Flavour/Dirac structure specific”**, which may need be postulated to further construct new physics models.
