

# THE CEPHEID LEAVITT LAW FROM GAIA DR2 PARALLAXES OF RESOLVED COMPANIONS

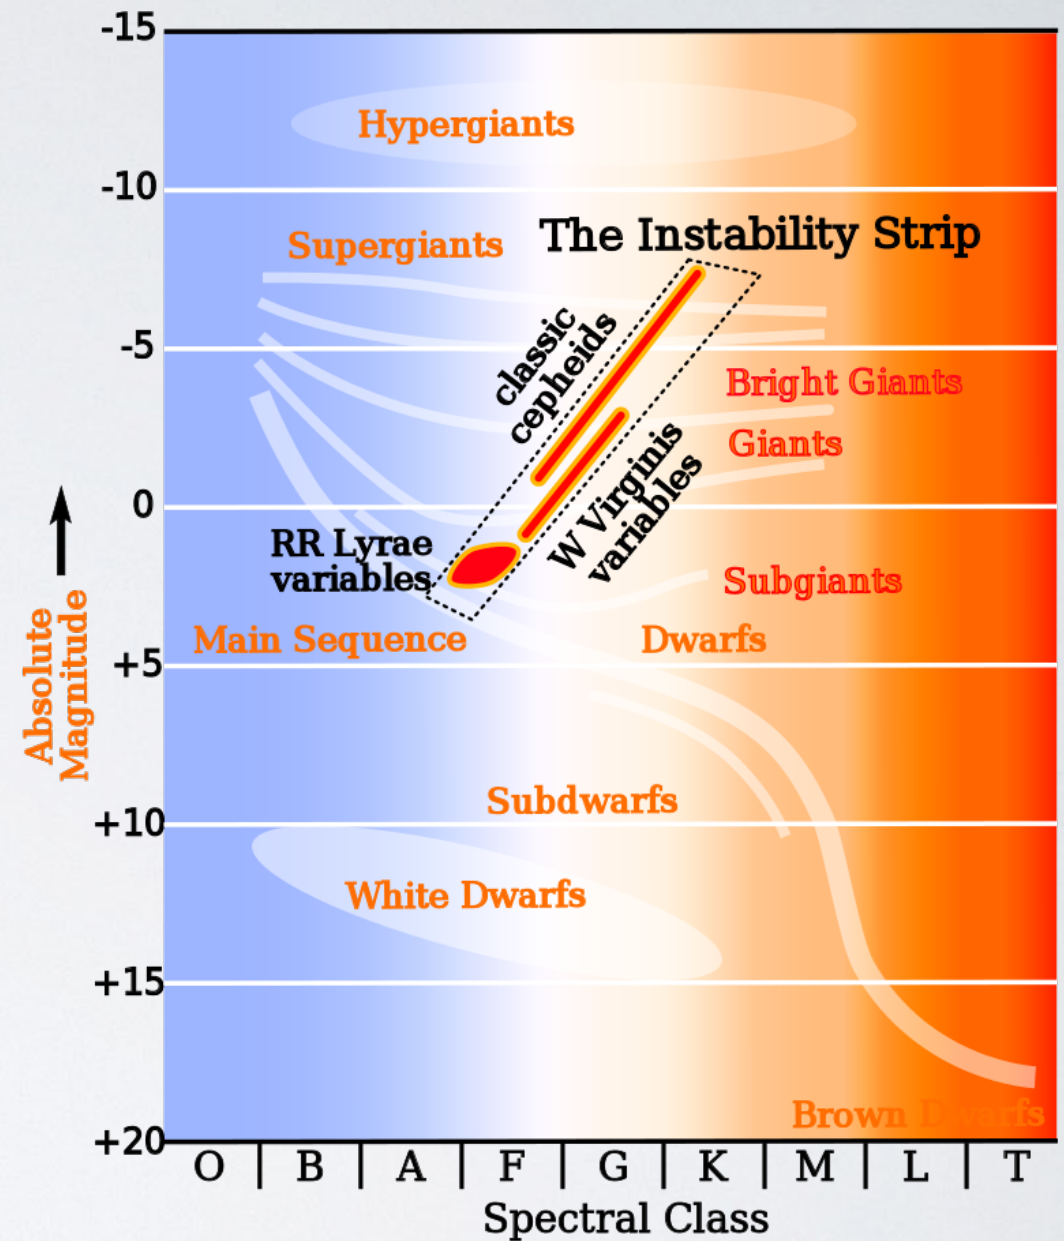

Louise Breuval  
Observatoire de Paris, LESIA

# CEPHEIDS

# CEPHEIDS

- ★ Pulsating stars (period 2-100 days)
- ★ Bright and massive stars ( $\sim 10 M_{\odot}$ ,  $10\,000 L_{\odot}$ )
- ★ Present in the Milky Way, Magellanic Clouds, and in distant galaxies

*Instability strip in the HR diagram*

# CEPHEIDS

- ★ 1908 : Henrietta Leavitt discovers that the pulsation **period P** of a Cepheid is linked with its **magnitude M** :

$$M = a \log P + b$$

*Henrietta Leavitt*

My PhD topic :

→ **precise calibration** of this relation

*First calibration of the Leavitt law (Leavitt & Pickering 1912)*

# GAIA PARALLAXES

# GAIA PARALLAXES OF CEPHEIDS

---

★ We need **very precise distances** to calibrate the PL relation

★ Over the past 20 years, only the **Hubble Space Telescope (HST)** provided Cepheid geometrical parallaxes :

- Freedman et al. (2001)
- Sandage et al. (2006)
- Benedict et al. (2002, 2007)
- Riess et al. (2011, 2014, 2016, 2018, 2019)

★ GAIA satellite : first alternative to HST parallaxes (1.3 billion stars)

*Hubble Space Telescope  
(NASA, ESA)*

*GAIA satellite (ESA)*

# GAIA PARALLAXES

---

- ★ Gaia parallaxes are derived assuming that the stars have a **constant color** and a **constant brightness**.

Lindgren et al. (2018), Mowlavi et al. (2018)

- Not made for Cepheids !
- **Astrometric bias** : parallaxes of Cepheids are potentially **unreliable**.

# GAIA PARALLAXES

★ Other independent bias :

→ uncertain parallax **zero-point** offset

ZP <sub>Gaia</sub> (mas)	Reference	Type of sources
<b>-0.029</b>	Lindgren et al. (2018)	Quasars
-0.031 $\pm 0.011$	Graczyk et al. (2019)	Eclipsing binaries
-0.0319 $\pm 0.0008$	Arenou et al. (2018)	MW Cepheids
-0.035 $\pm 0.016$	Sahlholdt & Silva Aguirre (2018)	Dwarf stars
-0.041 $\pm 0.010$	Hall et al. (2019)	Red giants
-0.046 $\pm 0.013$	Riess et al. (2018b)	MW Cepheids
-0.049 $\pm 0.018$	Groenewegen (2018)	MW Cepheids
-0.053 $\pm 0.003$	Zinn et al. (2019)	Red giants
-0.054 $\pm 0.006$	Schönrich et al. (2019)	GDR2 RV
-0.057 $\pm 0.003$	Muraveva et al. (2018)	RR Lyrae
-0.070 $\pm 0.010$	Ripepi et al. (2019)	LMC Cepheids
-0.082 $\pm 0.033$	Stassun & Torres (2018)	Eclipsing binaries

*Estimations of Gaia DR2 parallax zero-point offset (Breuval et al. 2019, A&A, submitted)*

# CALIBRATION OF THE P-L RELATION

# CALIBRATION OF THE P-L RELATION

- ★ 23 Milky Way Cepheids with close-in **resolved** companions.  
(Kervella et al. 2019b)

Difference between Cepheids and companions parallaxes from Gaia DR2

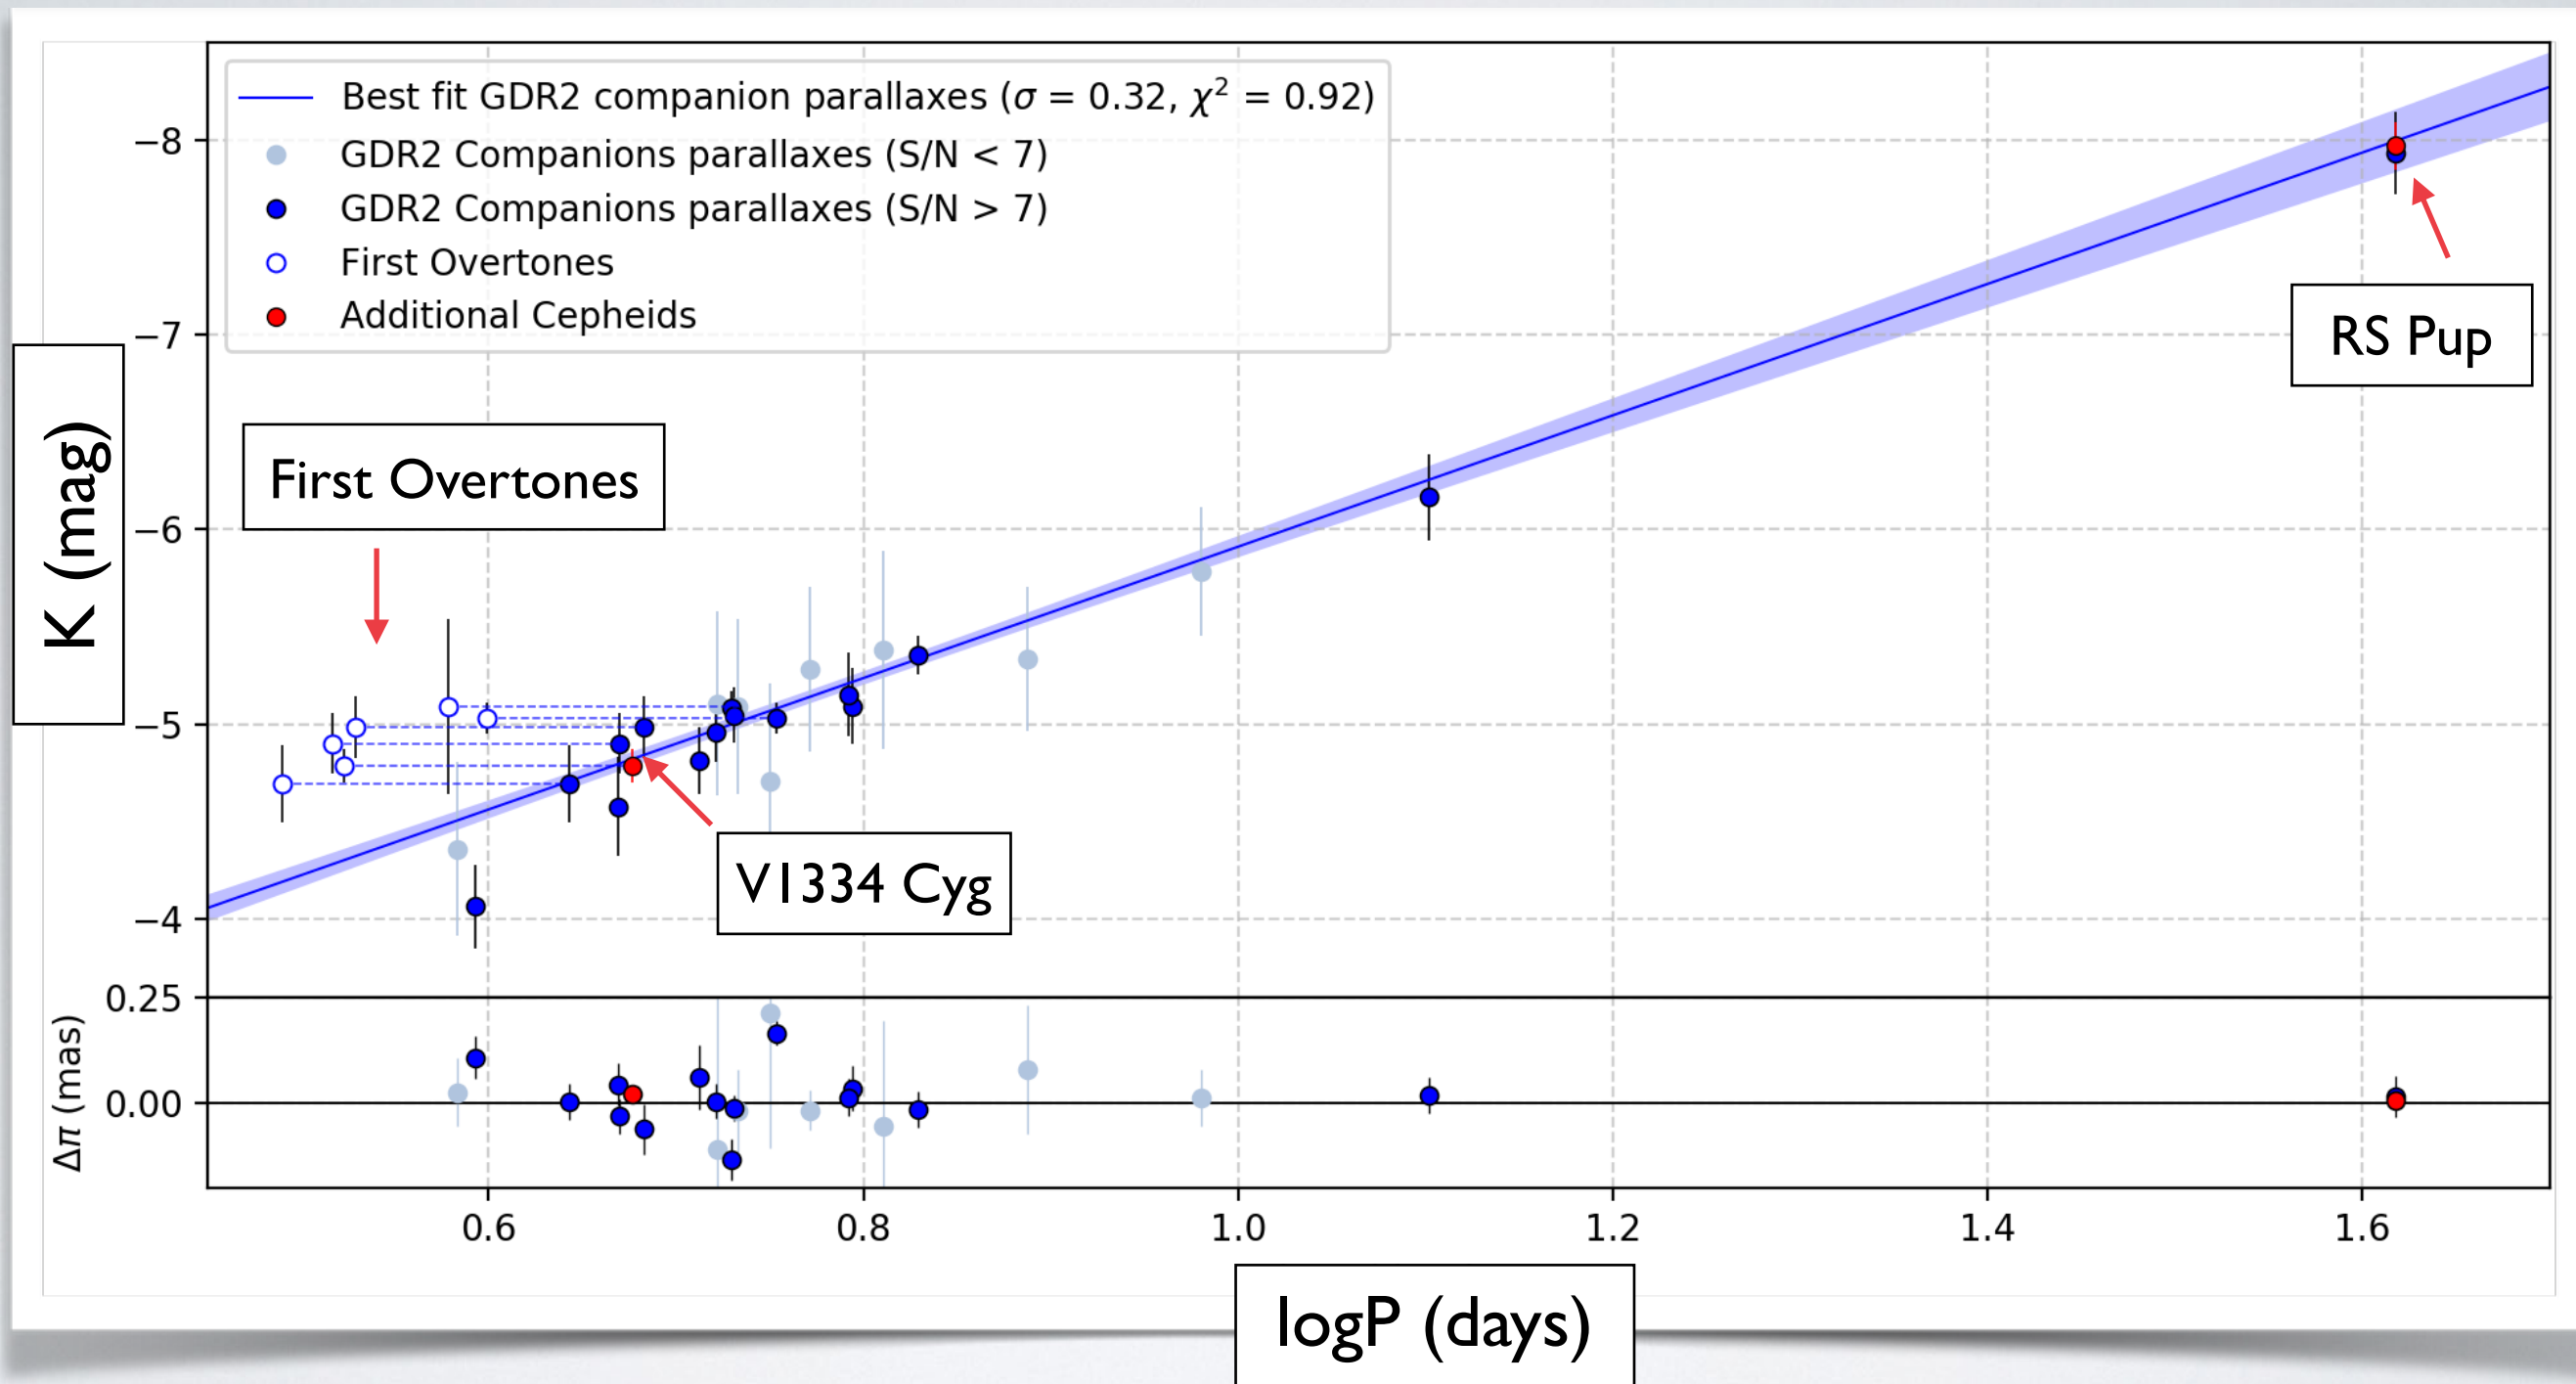

Proper motion of Delta Cep and its companion  
(Kervella et al. 2019b)

We use the Gaia DR2  
parallaxes of the  
**companions**

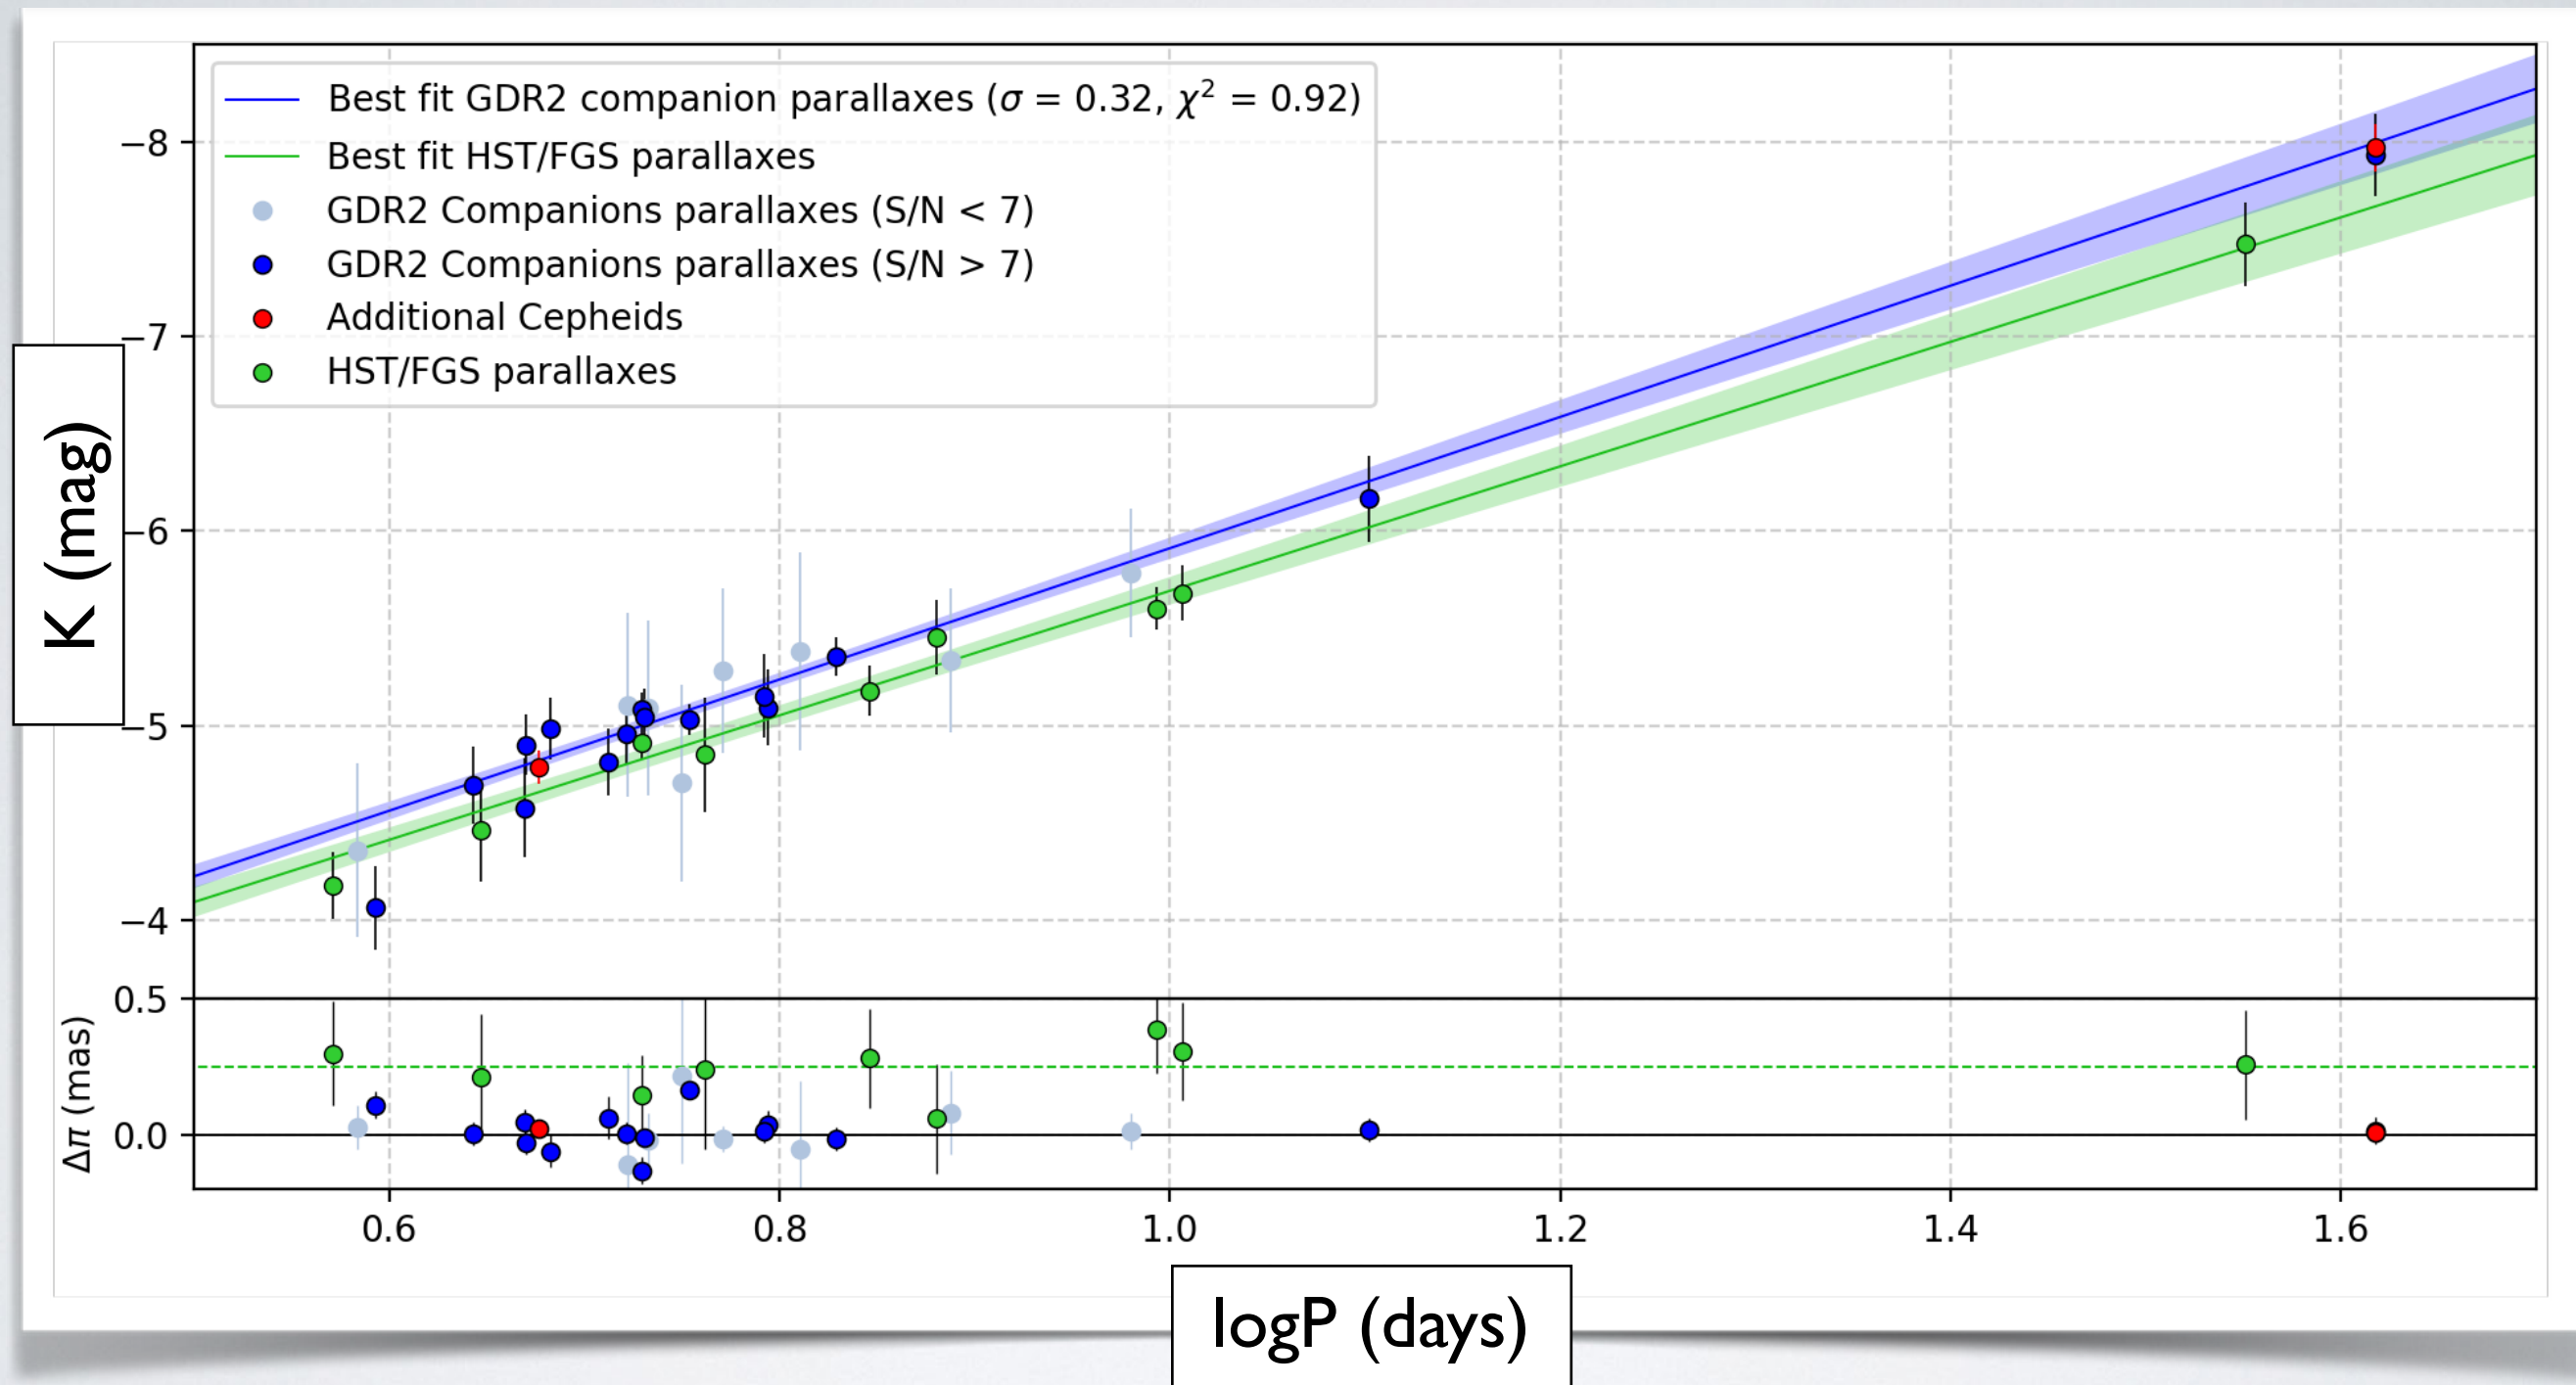

# CALIBRATION OF THE P-L RELATION

Breuval et al. (2019), A&A, submitted

# CALIBRATION OF THE P-L RELATION

*Breuval et al. (2019), A&A, submitted*

# RESCALING OF $H_0$

# RESCALING OF $H_0$

New value based on GDR2  
Cepheids companions

$H_0 = 73.24 \pm 1.74 \text{ km/s/Mpc}$   
(Riess et al. 2016)

$$H_{0, \text{Gaia}} = (\pi_{\text{Gaia}} / \pi_{\text{R16}}) \times H_{0, \text{R16}}$$

Gaia DR2  
companion parallax

Expected parallax from  
Riess et al. (2016)

*Method from Riess et al. (2018a)*

# RESCALING OF $H_0$

---

★ Expected parallax from [Riess et al. \(2016\)](#) :

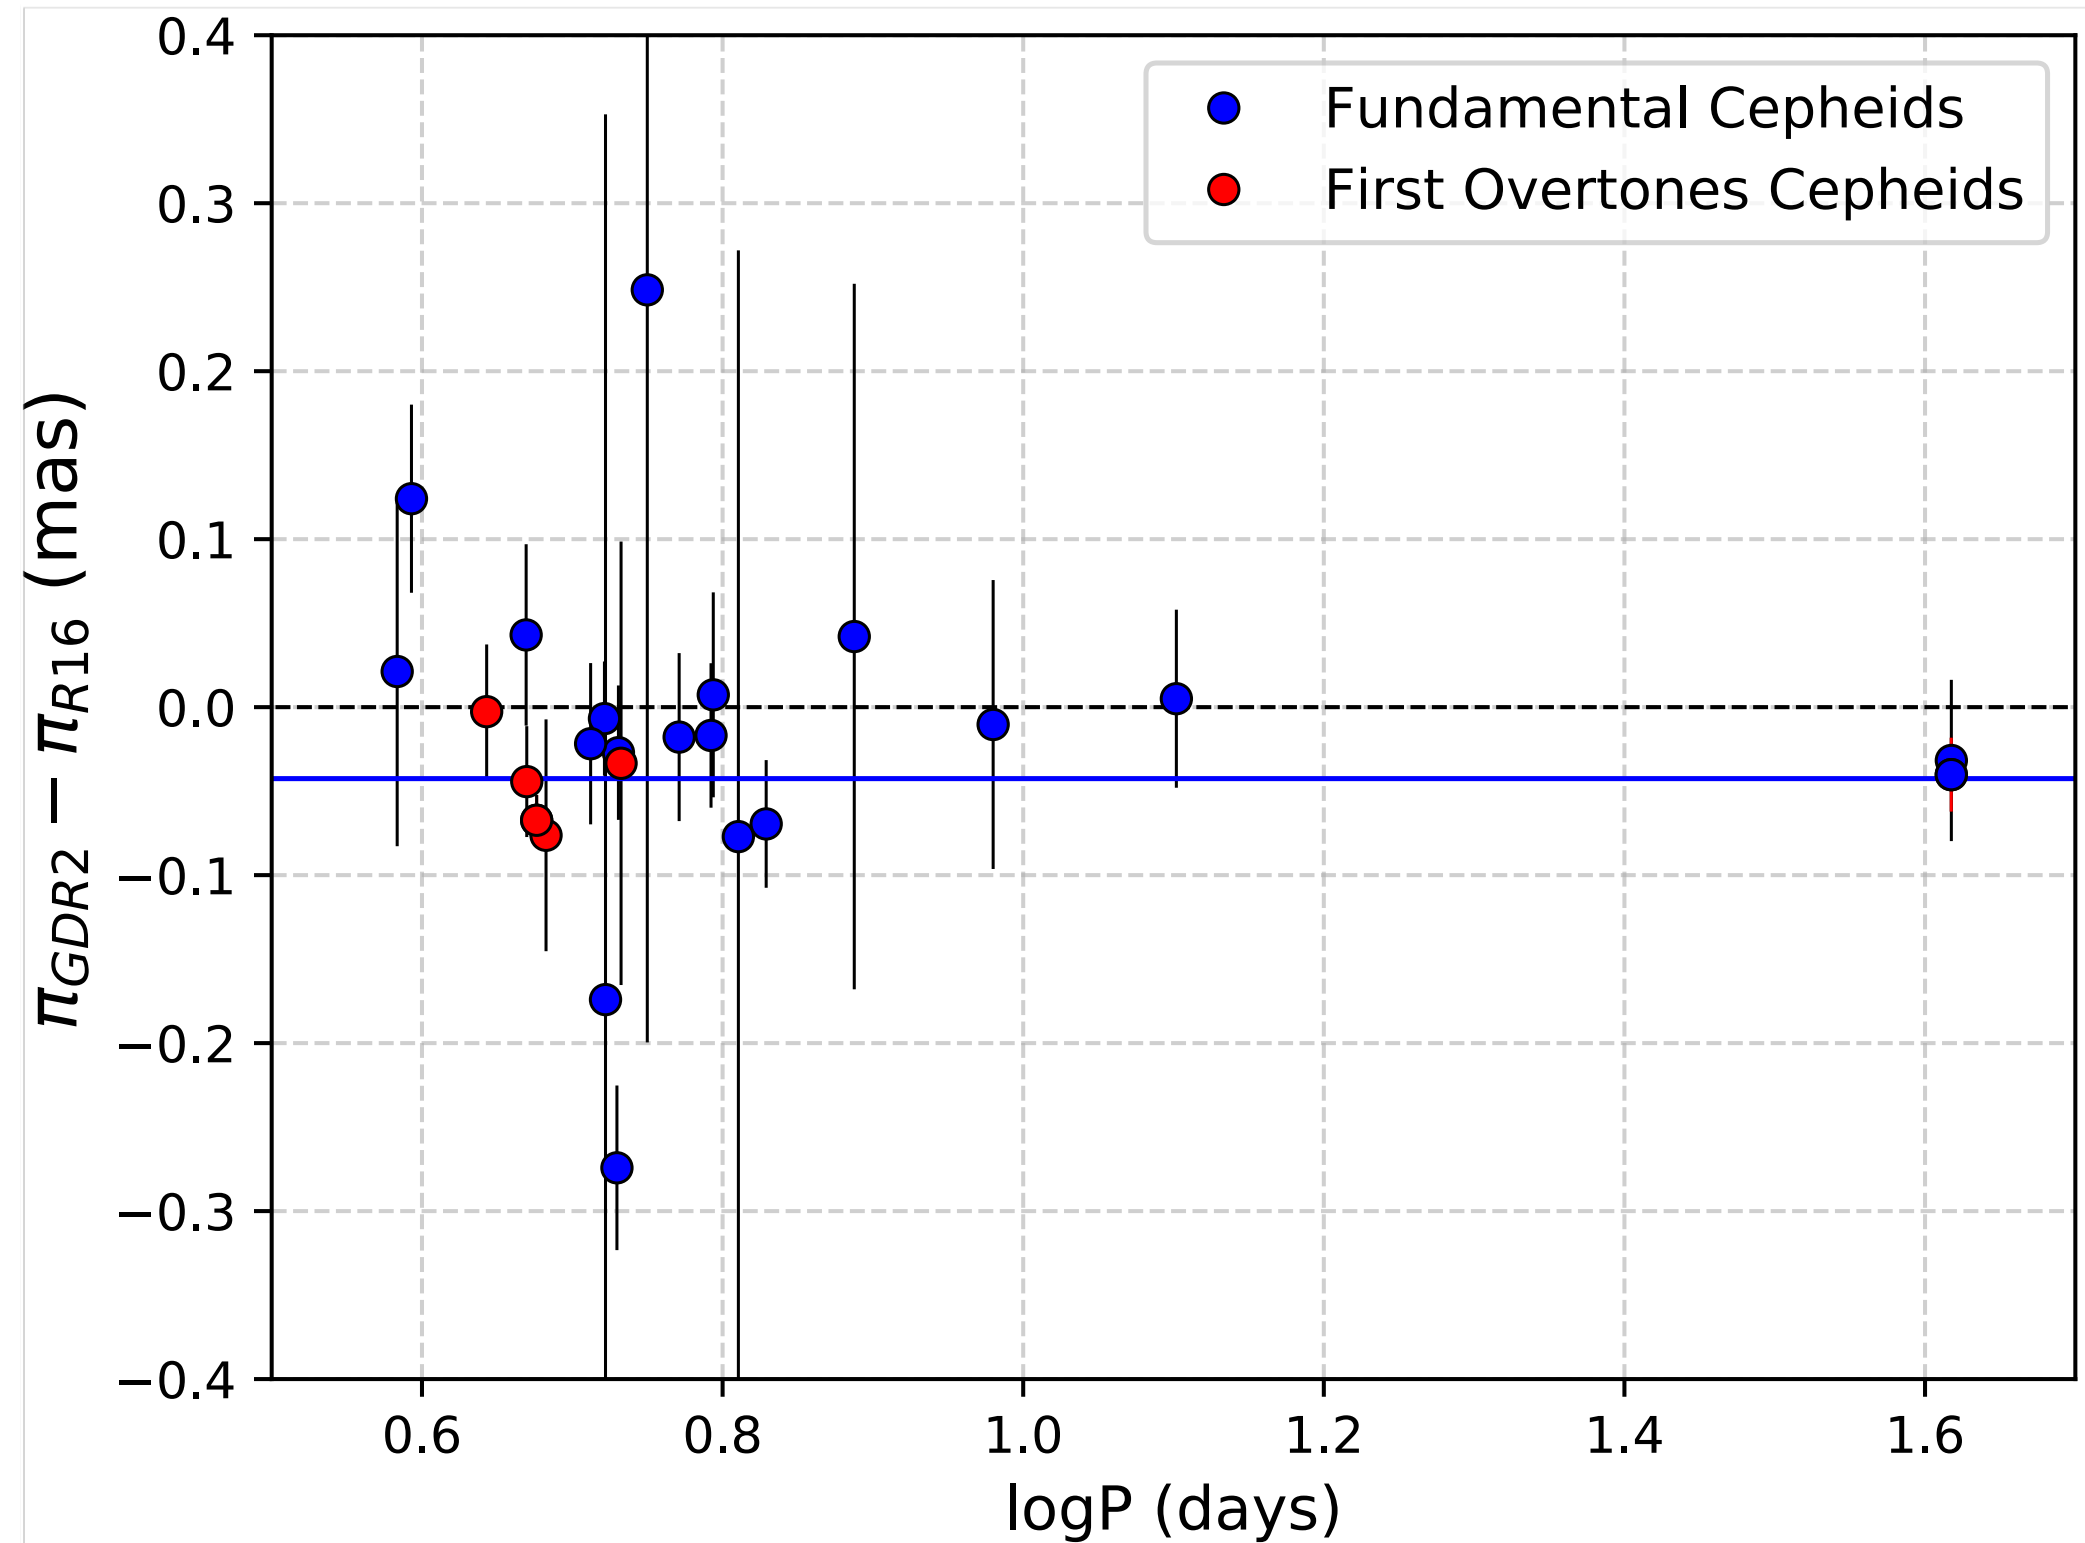

$$\pi_{R16} = 10^{-0.2(m - M - 10)}$$

★ Apparent magnitudes :  $m = F160W - 0.386(F555W - F814W)$

→ reconstructed from ground magnitudes (J, H, V)

★ Absolute magnitudes :  $M = -5.93 - 3.26(\log P - 1)$  ([Riess et al. 2016](#))

# RESCALING OF $H_0$

# RESCALING OF $H_0$

# CONCLUSION

---

- ★ Using companions parallaxes allows us to :
  - bypass the bias on GDR2 Cepheids parallaxes
  - calibrate the Leavitt law with non-HST parallaxes
- ★ We detected a possible offset on HST/FGS parallaxes
- ★ We need to investigate the metallicity effect on PL relations
- ★ We expect the Gaia DR3 to :
  - provide a precise value of the parallaxes offset
  - provide better Cepheids parallaxes

# Thank you !
