IRN Terascale

Brussels, October 2019

Goals

- Study the effects of New Physics parametrized by SM dimension-six operators in $e^+e^- \rightarrow h h$ at future lepton colliders
- Perform sensitivity study for several benchmark values of energy and integrated luminosity

Motivation

In the SM, the process $gg \rightarrow hh$ (Plehn, Spira & Zerwas, 1996) present destructive interference between boxes and triangle topologies: the closer to the threshold, the stronger the cancellation. (Li & Voloshin, 2013)

Small cross-section

Sensitive to
New Physics effects

Motivation

In the SM, the process $gg \rightarrow hh$ (Plehn, Spira & Zerwas, 1996) present interference between boxes and triangle topologies: the closer one gets to the threshold, the stronger the cancellation. (Li & Voloshin, 2013)

Small cross-section

Sensitive to
New Physics effects

Does the process $e^+e^- \rightarrow hh$ show a similar behavior ?

Lepton Colliders

(Giacomelli, 2018
EOS Solstice meeting)

Higher luminosities for circular colliders than for linear. Linear colliders reach higher energies.

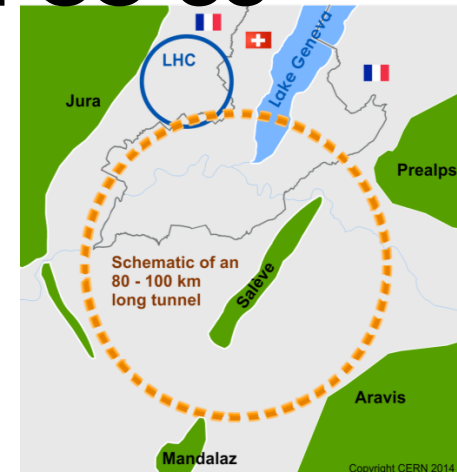

Lepton Colliders

ILC

FCC-ee

CLIC

Lepton Colliders

Different processes that will provide clean data to probe new physics.

Lepton Colliders

Different process that will provide clean data to probe new physics.

What about the process $e^+e^- \rightarrow hh$?

Lepton Colliders

Different process that will provide clean data to probe new physics.

What about the process $e^+e^- \rightarrow hh$?

Cross-section too small,
doesn't even appear in the plot.

It is of order 10^{-2} fb

Lepton Colliders

Different process that will provide clean data to probe new physics.

What about the process $e^+e^- \rightarrow hh$?

Cross-section too small,
doesn't even appear in the plot.

It is of order 10^{-2} fb

Why is it too small?

Standard Model Process

Tree Level diagrams suppressed
being proportional to the electron
mass

Standard Model Process

Tree Level diagrams suppressed
being proportional to the electron
mass

The leading order is at 1-loop.

Standard Model Process

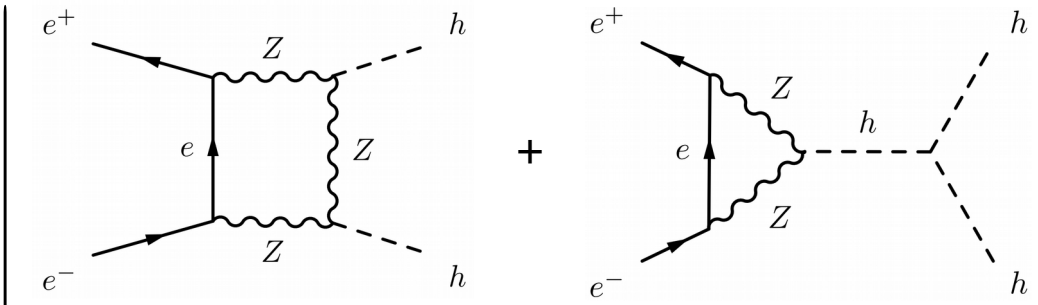

Tree Level diagrams suppressed
being proportional to the electron
mass

Do the boxes and triangles
interfere?

Standard Model Process

$$|\mathcal{M}|^2 \sim \left| \begin{array}{c} \text{Diagram 1} \\ + \\ \text{Diagram 2} \end{array} \right|^2$$

The image shows two Feynman diagrams for the process $e^+e^- \rightarrow hh$. Diagram 1 (left) is a t-channel exchange of an electron (e) between an incoming e^+ and e^- pair and two outgoing h particles, with Z bosons at the vertices. Diagram 2 (right) is a t-channel exchange of an h boson between an incoming e^+ and e^- pair and two outgoing h particles, with Z bosons at the vertices. The diagrams are summed and squared to give the matrix element squared, $|\mathcal{M}|^2$.

Answer: **NO**

Standard Model Process

$$|\mathcal{M}|^2 \sim \left| \begin{array}{c} \text{Diagram 1} + \text{Diagram 2} \end{array} \right|^2$$

The equation shows the squared magnitude of the scattering amplitude, $|\mathcal{M}|^2$, is proportional to the squared magnitude of the sum of two Feynman diagrams. The first diagram (Diagram 1) is a box diagram with incoming e^+ and e^- lines, internal e and Z lines, and outgoing h and h lines. The second diagram (Diagram 2) is a triangle diagram with incoming e^+ and e^- lines, internal e and Z lines, and outgoing h and h lines.

Triangle diagrams
are negligible.

Standard Model Process

$$|\mathcal{M}|^2 \sim \left| \begin{array}{c} e^+ \text{---} Z \text{---} h \\ | \\ e^- \text{---} Z \text{---} h \end{array} + \begin{array}{c} e^+ \text{---} Z \text{---} h \\ | \\ e^- \text{---} Z \text{---} h \end{array} \right|^2$$

Triangle diagrams are negligible.

Two possible structures

Vector boson = -1

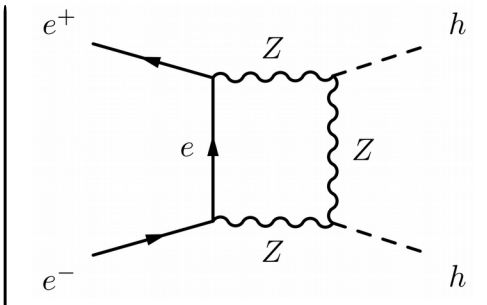

Parity violation:

Final state = +1

Mass insertion $\sim m_e$

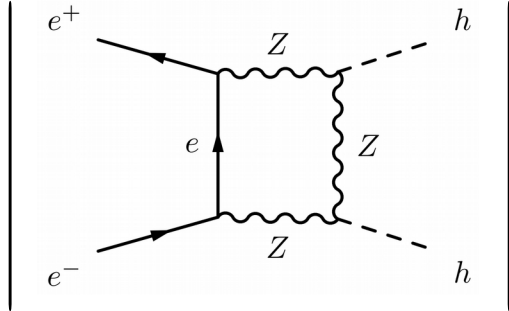

Standard Model Process

$$|\mathcal{M}|^2 \sim \left| \begin{array}{c} e^+ \\ \swarrow \quad \searrow \\ \text{---} Z \text{---} \\ \nearrow \quad \nwarrow \\ e^- \end{array} \right|^2$$

The diagram illustrates a box diagram for the process $e^+e^- \rightarrow hh$. It features an incoming electron (e^-) and positron (e^+) pair. The positron line goes up and the electron line goes down, meeting at a vertex where a virtual electron (e) is produced. This virtual electron then interacts with a virtual Z boson, which in turn interacts with a scalar particle (h). The scalar particle then interacts with another Z boson, which finally interacts with the virtual electron line. The entire process is enclosed in a box, with the Z bosons represented by wavy lines and the scalar particles by dashed lines.

In the end, the leading order is given just by 8 box-diagrams.

Standard Model Process

$$|\mathcal{M}|^2 \sim \left| \begin{array}{c} e^+ \\ \swarrow \quad \searrow \\ \text{---} Z \text{---} \\ \nearrow \quad \nwarrow \\ e^- \end{array} \right|^2$$

With the large luminosities at future lepton colliders, order one hundred of events might be collected in the course of few years.

Cross-section can be enhanced by BSM physics.

In the end, the leading order is given just by 8 box-diagrams.

Table 2: Dimension-six operators other than the four-fermion ones.

We consider effects of new physics parametrized by the presence of higher dimensional operators in the SMEFT framework. We write the SMEFT lagrangian as

$$\mathcal{L}_{\text{SMEFT}} = \mathcal{L}_{\text{SM}} + \sum_i \frac{c_i^{(n)}}{\Lambda^{n-4}} \mathcal{O}_i^{(n)} + \dots$$

We focus on dimension-6 operators, and in particular we work in Warsaw basis.

(Grzadkowski et al., 2010)

A third class of dim-6 operators are those that introduce a direct coupling between ee and $t\bar{t}$.

1-Loop contributions proportional to the top mass

Almost all of the seven operators give zero contribution due to spinor structures
Parity reasoning

Just one operator survives.

Redefinition to keep the tree-level SM relation

$$m_e = y_e \frac{v}{\sqrt{2}}$$

$$\mathcal{L} = \frac{c_{e\varphi}}{\Lambda^2} \left(\varphi^\dagger \varphi - \frac{v^2}{2} \right) \bar{l}_L \varphi e_R + \frac{c_{et}}{\Lambda^2} \epsilon_{ij} (\bar{l}_L^i e_R) (\bar{q}_L^j t_R)$$

The process in the SM-EFT

The electron-Higgs interaction
gets modifications

at tree level from the operator $\mathcal{O}_{e\varphi}$

The process in the SM-EFT

The electron-Higgs interaction
gets modifications

at tree level from the operator $\mathcal{O}_{e\varphi}$

and at loop level from \mathcal{O}_{et}

$$e^- \rightarrow e^+ \quad = \quad -i\Sigma_e \quad = \quad -i \frac{6}{(4\pi)^2} \frac{c_{et}}{\Lambda^2} m_t^3 \left(1 + \frac{1}{\epsilon} + \log \frac{\mu^2}{m_t^2} \right)$$

The process in the SM-EFT

The electron-Higgs interaction gets modifications

at tree level from the operator $\mathcal{O}_{e\varphi}$

and at loop level from \mathcal{O}_{et}

$$e^- \rightarrow e^+ = -i\Sigma_e = -i \frac{6}{(4\pi)^2} \frac{c_{et}}{\Lambda^2} m_t^3 \left(1 + \frac{1}{\epsilon} + \log \frac{\mu^2}{m_t^2} \right)$$

Tree-level diagrams in SMEFT are computed with the new Yukawa coupling

$$\Rightarrow -\frac{m_e}{v} \rightarrow -\frac{m_e}{v} + \frac{c_{e\varphi} v^2}{\Lambda^2 \sqrt{2}} - \frac{6}{(4\pi)^2} \frac{c_{et}}{\Lambda^2} \frac{m_t^3}{v} \left(1 + \log \frac{\mu^2}{m_t^2} \right)$$

The process in the SM-EFT

These diagrams are UV divergent

The process in the SM-EFT

These diagrams are UV divergent

The operator that modifies the Yukawa coupling provides the counter-term for the top-loops

The process in the SM-EFT

These diagrams are UV divergent

The operator that modifies the Yukawa coupling provides the counter-term for the top-loops

$$\delta c_{e\varphi} = \frac{6}{(4\pi)^2} c_{et} y_t (y_t^2 - \lambda) \frac{1}{\bar{\epsilon}}$$

$$\delta y_e = -\frac{3}{(4\pi)^2} c_{et} v^2 y_t^3 \frac{1}{\bar{\epsilon}}$$

Our Analysis

We compute the cross-section as a function of \sqrt{s} and of the Wilson coefficients $c_{e\varphi}$ and c_{et} , such that

$$\sigma^{SMEFT} \left(\sqrt{s}, \frac{c_{e\varphi}}{\Lambda^2}, \frac{c_{et}}{\Lambda^2} \right) \sim \mathcal{O}(c_{e\varphi}^2) + \mathcal{O}(c_{e\varphi} c_{et}) + \mathcal{O}(c_{et}^2).$$

Thus, the exclusion regions are computed through a χ^2 -distribution analysis

$$\chi^2 \left(\sqrt{s}, \frac{c_{e\varphi}}{\Lambda^2}, \frac{c_{et}}{\Lambda^2} \right) = \frac{[\sigma^{SMEFT}(\sqrt{s}, \frac{c_{e\varphi}}{\Lambda^2}, \frac{c_{et}}{\Lambda^2}) - \sigma^{SM}(\sqrt{s})]^2}{\delta\sigma^2},$$

where the uncertainty is $\delta\sigma^2 = \delta\sigma_{stat}^2 + \delta\sigma_{sys}^2$ and

$$\delta\sigma_{stat} = \sqrt{\sigma^{SM}/L} \quad \delta\sigma_{sys} = \alpha\sigma^{SM} \quad (\alpha = 0.1)$$

The computations were done using FeynRules, FeynArts + FormCalc + LoopTools and cross-check with NLOCT and MG5_aMC@NLO.

Benchmark values & Results

Benchmark	Experiment	\sqrt{s} (GeV)	L (ab^{-1})	$ c_{e\varphi}/\Lambda^2 (\text{TeV}^{-2})$	$ c_{et}/\Lambda^2 (\text{TeV}^{-2})$
1	FCC-ee	350	2.6	< 0.003 (< 0.004)	< 0.116 (< 0.146)
2	CLIC	380	0.5	< 0.004 (< 0.006)	< 0.143 (< 0.184)

4	CLIC	1500	1.5	< 0.003 (< 0.003)	< 0.027 (< 0.035)
5	CLIC	3000	3.0	< 0.002 (< 0.002)	< 0.012 (< 0.015)

Benchmark scenarios considered in our analysis.

The last two columns represent the 95 % CL intervals for each operator coefficient taken individually in the analysis with $k = 1$ ($k = 0.35$).

$$k = \text{BR}(h \rightarrow f_1 \bar{f}_1) \times \text{BR}(h \rightarrow f_2 \bar{f}_2)$$

k factor keeps track of the Branching Ratio ($k=0.35$ just $b\bar{b}$ decay)

After considering all contributions to the $e\bar{e}h$ -vertex, the recent upper bound on the electron Yukawa coupling obtained from Higgs decay ([Altmannshofer, Brod & Schmaltz, 2015](#))

The correction to the electron mass may introduce a fine tuning problem and in order to avoid it one must require that

$$|\delta m_e| \leq m_e$$

In this case we have that

$$\left| \frac{c_{et}}{\Lambda^2} \right| \lesssim \frac{8\pi^2}{3} \frac{m_e}{m_t^3} \simeq 2 \times 10^{-3} \text{TeV}^{-2}$$

Results – Additional possible bounds

$$\left| -\frac{m_e}{v} + \frac{c_{e\varphi}(\mu)v^2}{\Lambda^2\sqrt{2}} - \frac{3}{(4\pi)^2} \frac{y_t}{\sqrt{2}} \frac{c_{et}}{\Lambda^2} (4m_t^2 - m_h^2) \left[f(m_h^2, m_t^2) + \log \frac{\mu^2}{m_t^2} \right] \right| \lesssim 600 \frac{m_e}{v}$$

After considering all contributions to the $e\bar{e}h$ -vertex, the recent upper bound on the electron Yukawa coupling obtained from Higgs decay (Altmannshofer, Brod & Schmaltz, 2015)

$$|\delta m_e| \leq m_e$$

In this case we have that

$$\left| \frac{c_{et}}{\Lambda^2} \right| \lesssim \frac{8\pi^2}{3} \frac{m_e}{m_t^3} \simeq 2 \times 10^{-3} \text{TeV}^{-2}$$

Fine tuning is a guidance.

Summary

- Double Higgs production at future e^+e^- colliders offers the possibility to explore sensitivity to dim-6 operators involving electrons which have not been constrained yet.
- More stringent bounds are found in the $e^+e^- \rightarrow t\bar{t}$ process for the coefficient c_{et} : order 10^{-3}TeV^{-2} (Durieux, Perello, Vos & Zhang, 2018)
- This process presents a small SM cross section, which could be useful in the clean environment of lepton accelerators for finding NP.
- We derived 95% bounds on $c_{e\varphi}$ and c_{et} for several benchmark set ups in future colliders, finding that the bounds on $c_{e\varphi}$ probe scales of O(10 TeV) while the c_{et} operator probes scales of O(1 TeV).

Summary

- Double Higgs production at future e^+e^- colliders offers the possibility to explore sensitivity to dim-6 operators involving electrons which have not been constrained yet.

More stringent bounds can be found in the $e^+e^- \rightarrow t\bar{t}$ process for the coefficient c_{et} (Durieux, Perello, Vos & Zhang, 2018)

- This process presents a small SM cross section, which could be useful in the clean environment of lepton accelerators for finding NP.
- We derived benchmark $c_{e\varphi}$ probe scales of O
