10th International Conference on High Level Environmental Radiation Areas (ICHLERA 2022)

ID de Contribution: 80 Type: Invited talk

Up-to-date dose conversion factors for radon isotopes and their historical overview

mercredi 29 juin 2022 09:00 (30 minutes)

New radon conversion factors (DCF) for radon/thoron progeny have been presented in the ICRP Publication 137 (2017). There used to be a large difference in the DCF between those derived from epidemiological (ICRP 65) and from dosimetric approaches (ICRP 66). This revision results in a higher DCF than before. Hereafter a variety of radon issues may arise. In the present talk, the following topics will be presented:

- 1. Characteristics of radon and progeny
- 2. How to assess the effective dose due to inhalation of radon progeny
- 3. Lung dosimetry and influential parameters for dose assessment
- 4. Review of dose conversion factors in published data
- 5. Thoron issues
