

# Overview on Direct Dark Matter Search

Daide Franco  
Laboratoire APC  
SFP - 31/03/2022

# Dark Matter?

What about the DM particle candidate?

- 25% total energy or **80%** total mass of the Universe
- New unknown **particle**
- Not hot, better cold
- **Neutral** particle (dark)
- Stable or long lived
- Possibly a relic from Early Universe
- Very feebly **interacting**

# Dark Matter Particles?

## AXION ?

- Solve CP problem in QCD

## Sterile Neutrino ?

- 3.5 keV X-ray from indirect observation
- Cold:  $> 7$  keV mass scale

## WIMP ?

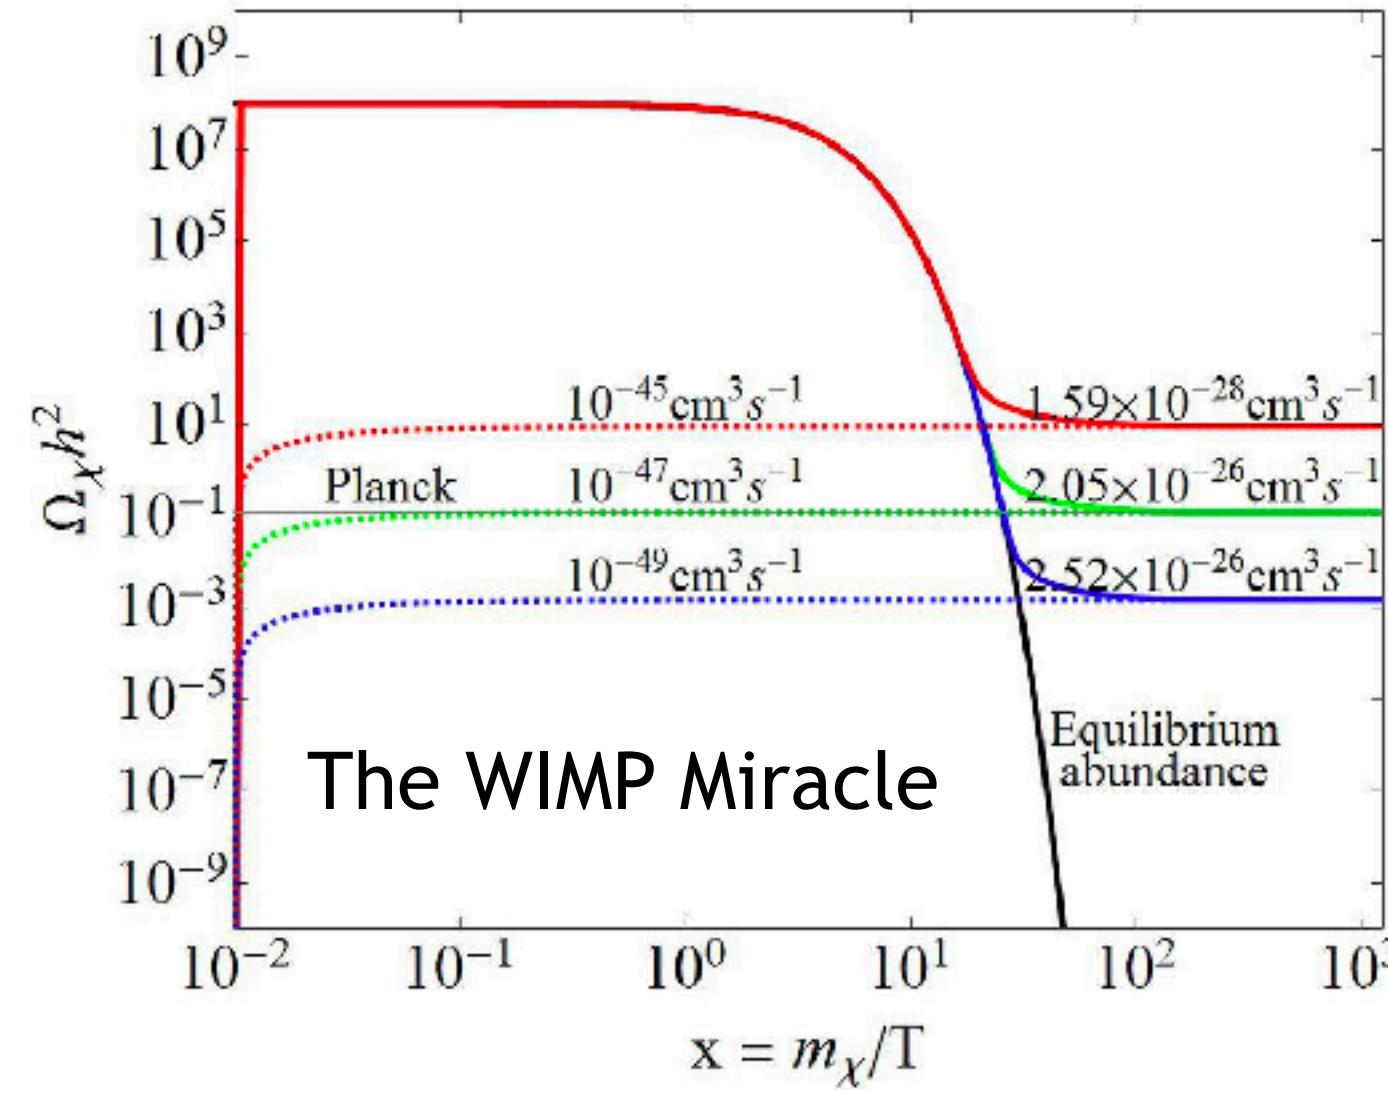

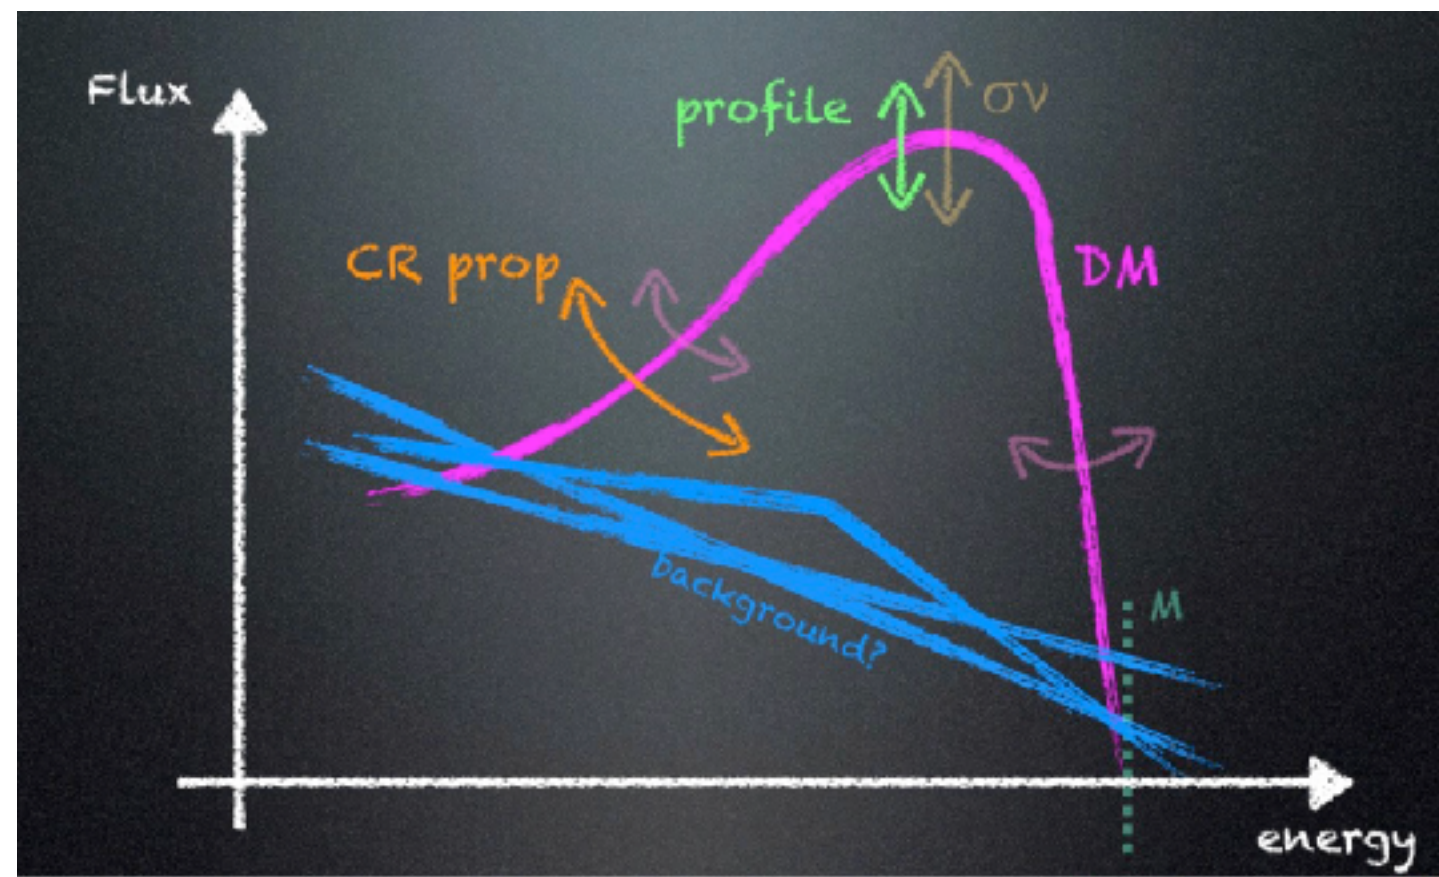

- Supersymmetry (getting weaker...)
- Naturally matches current DM density

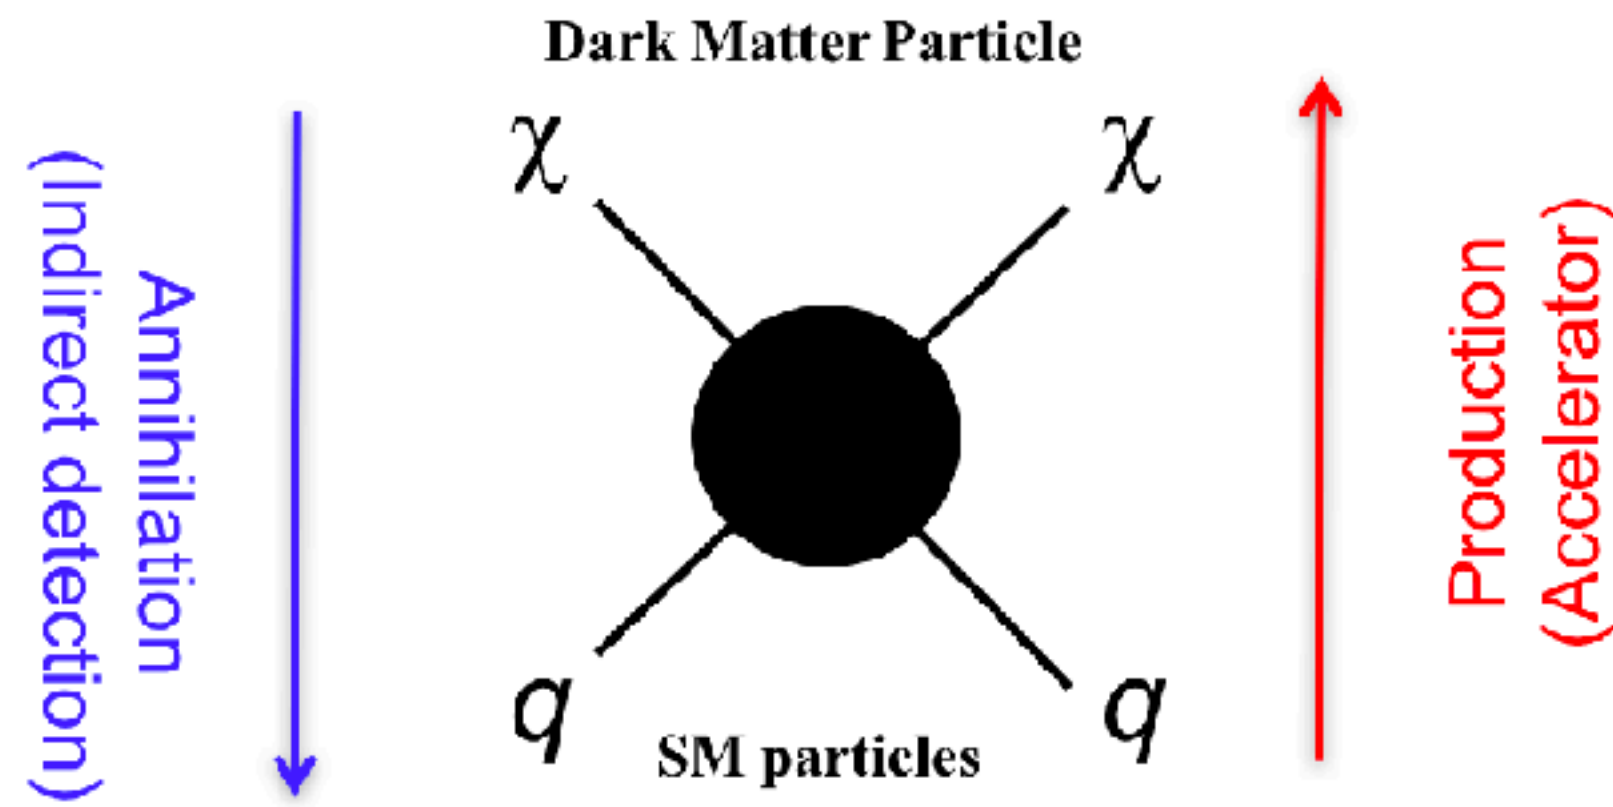

# Weakly Interacting Massive Particles

## Indirect detection

## Production at colliders

$$\begin{aligned} \chi\chi &\rightarrow q\bar{q}, l^+l^-, \nu^+\nu^- \\ &\rightarrow W^+W^-, ZZ \\ &\rightarrow \gamma\gamma, Z\gamma \end{aligned}$$

DM-SM Interaction  
(Direct detection)

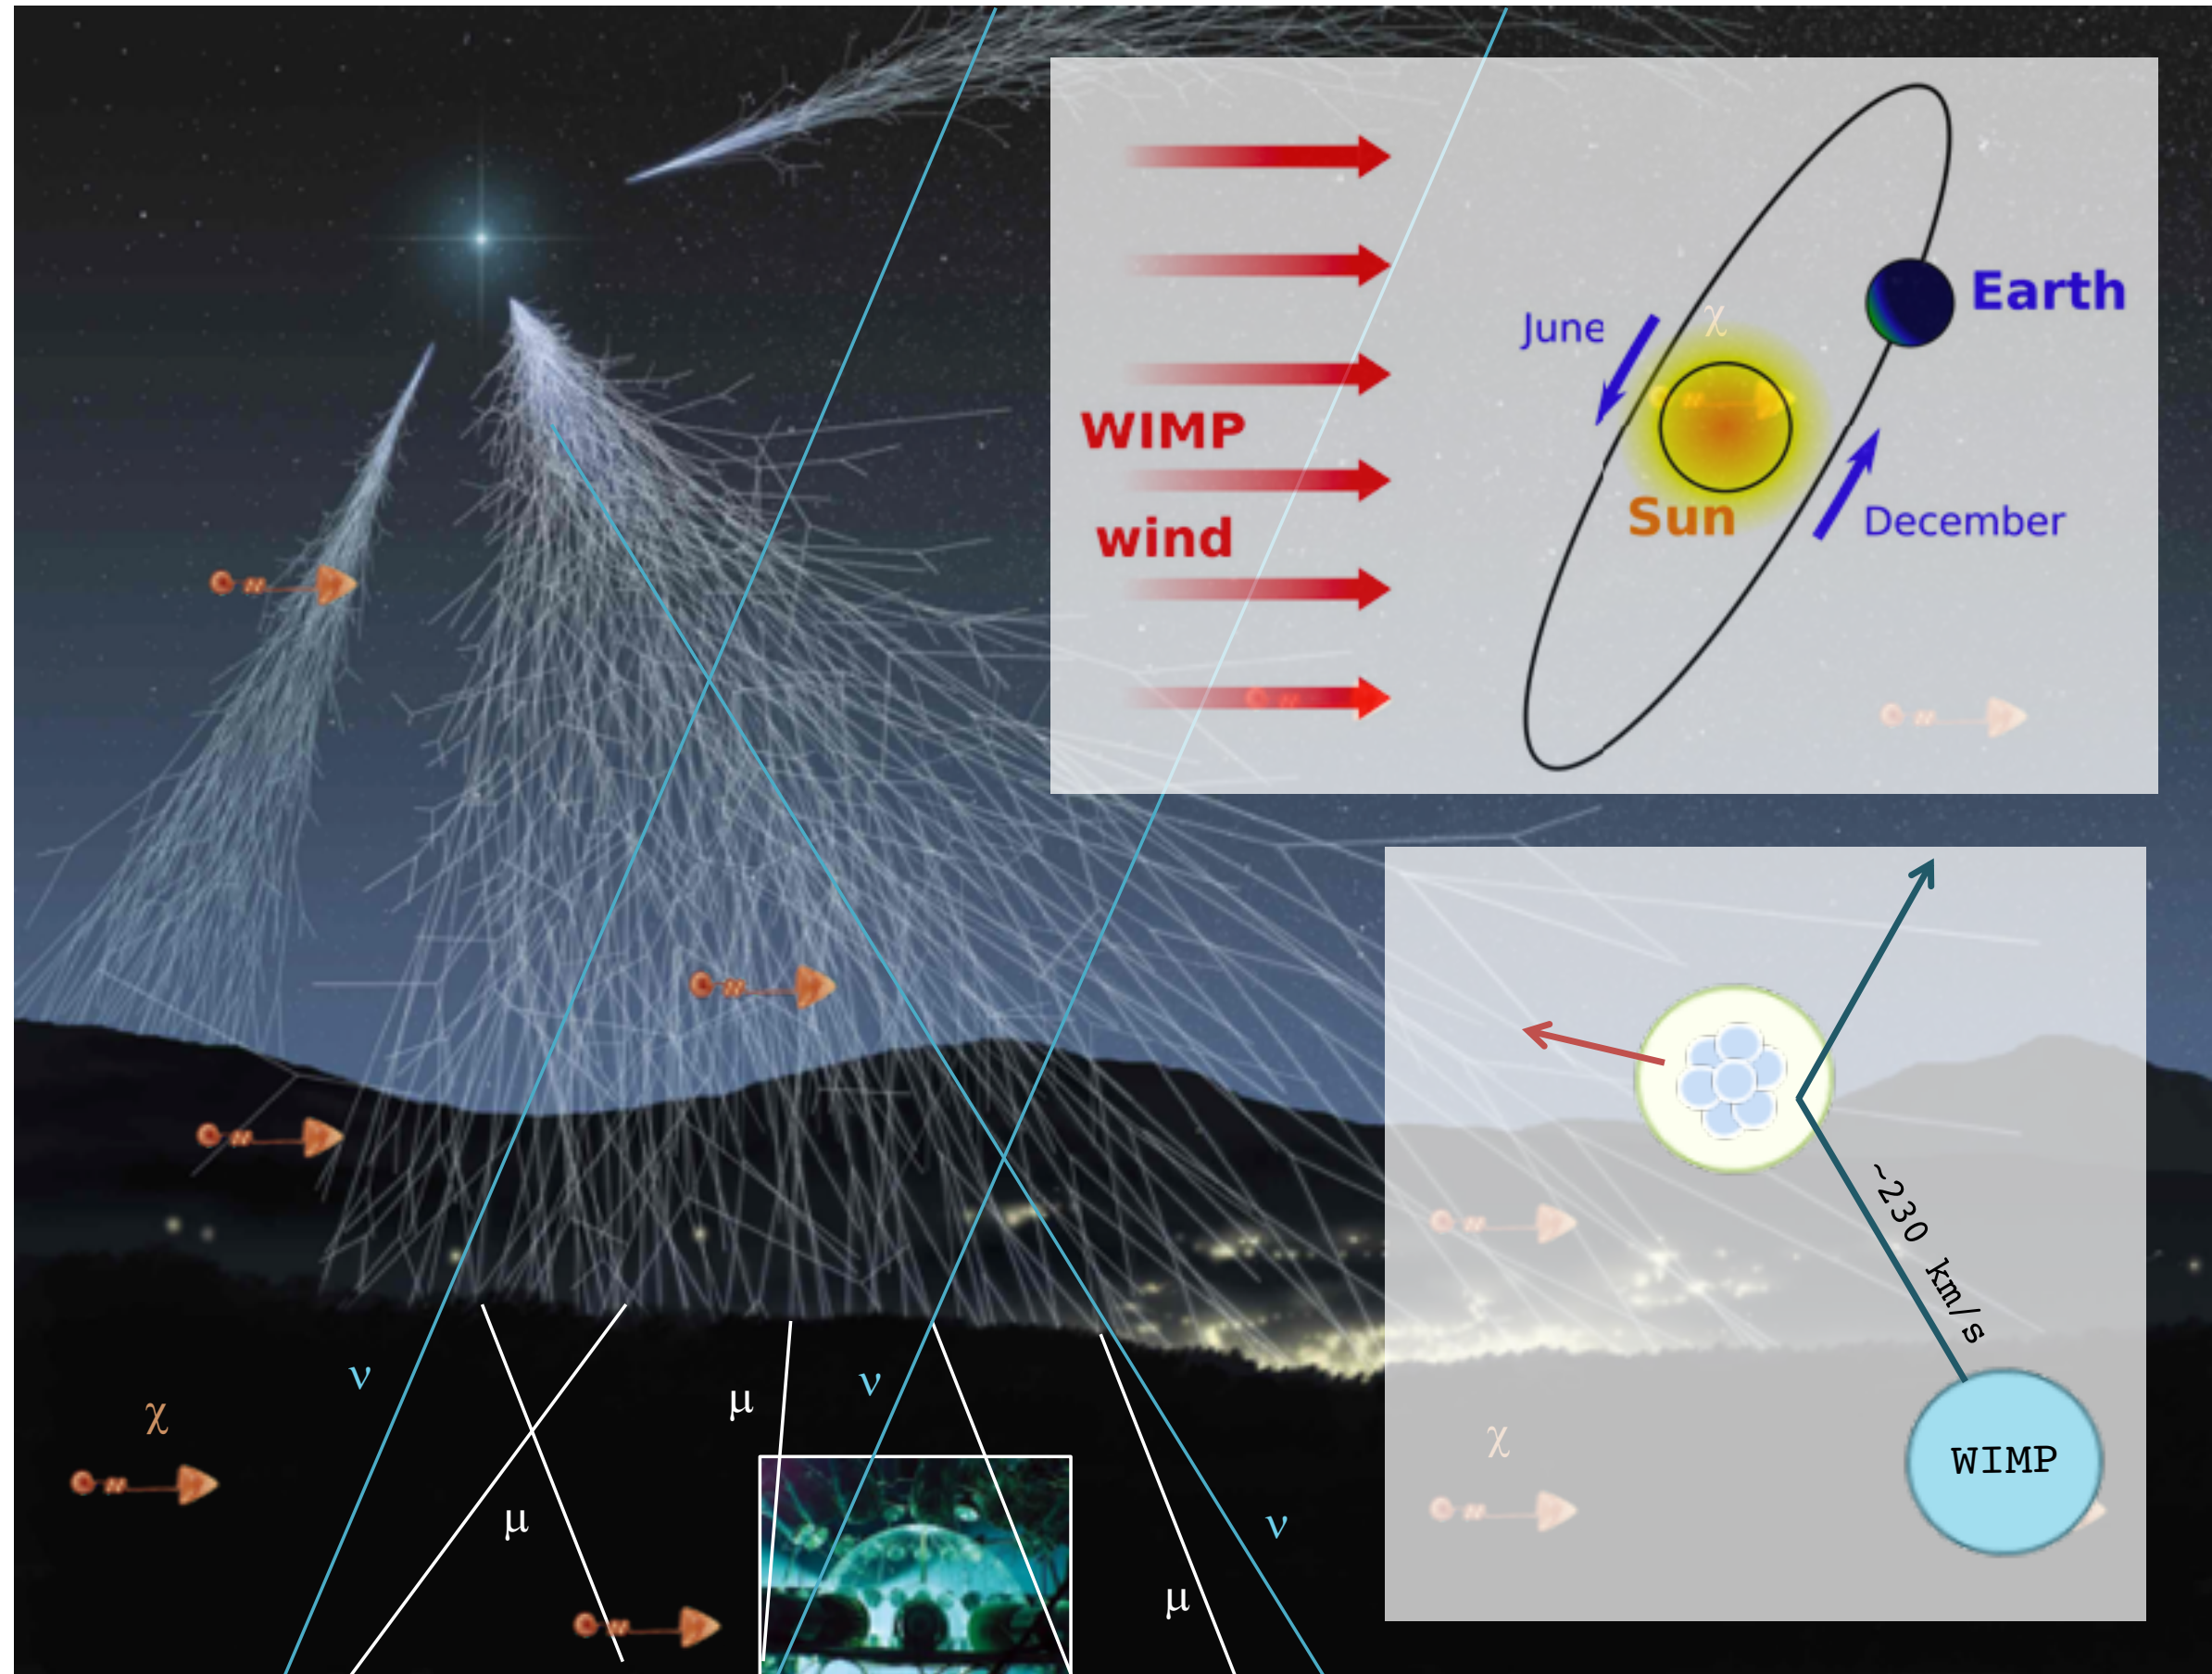

$$\chi + \text{Nucleus} \rightarrow \chi + \text{Nucleus}$$

# Direct Detection: Observables

## Annual Modulations

Earth rotation around the Sun => **largest speed** of the dark matter particles in the Milky Way halo relative to the Earth around **June 2nd** and **smallest in December**  
Expected seasonal variation at **2-10%** level

## Directionality

The recoil rate, in the Galactic rest frame, is **highly anisotropic**: the rate in the **forward direction** is roughly an order of magnitude larger than that in the backward direction

Event rate:  $R \propto N \frac{\rho_\chi}{m_\chi} \sigma_{\chi N} \cdot \langle v \rangle$

- $\rho_\chi$  local dark matter density = 0.3 GeV/cm<sup>3</sup>  
(~1 100 GeV WIMP in an American coffee cup)
- $m_\chi$  : WIMP mass
- $\sigma_{\chi N}$  : cross section
- $\langle v \rangle \sim 230$  km/s

Assuming  $m_\chi = 100$  GeV/c<sup>3</sup> and  $\sigma_{\chi N} = 10^{-47}$  cm<sup>2</sup>,  $R \sim 1$  event / ton / year in a liquid argon target

## Complementarity

if an excess of events is observed, a verification with a detector with a different target is necessary.

# Backgrounds and Detector Requirements

## Backgrounds

- **Cosmic** rays and cosmogenic isotopes
- **Natural** ( $^{238}\text{U}$ ,  $^{232}\text{Th}$ ,  $^{235}\text{U}$ ,  $^{222}\text{Rn}$ , ...) and **anthropogenic** ( $^{85}\text{Kr}$ ,  $^{137}\text{Cs}$ , ...) radioactivity
- **Neutrinos** (solar, atmospheric, diffuse supernovae)

## Electron / Nuclear Recoils

- The majority of events induce **electron** recoils
- Just a tiny fraction, mostly **neutrons**, are responsible of nuclear recoils, which perfectly mimic WIMP interactions

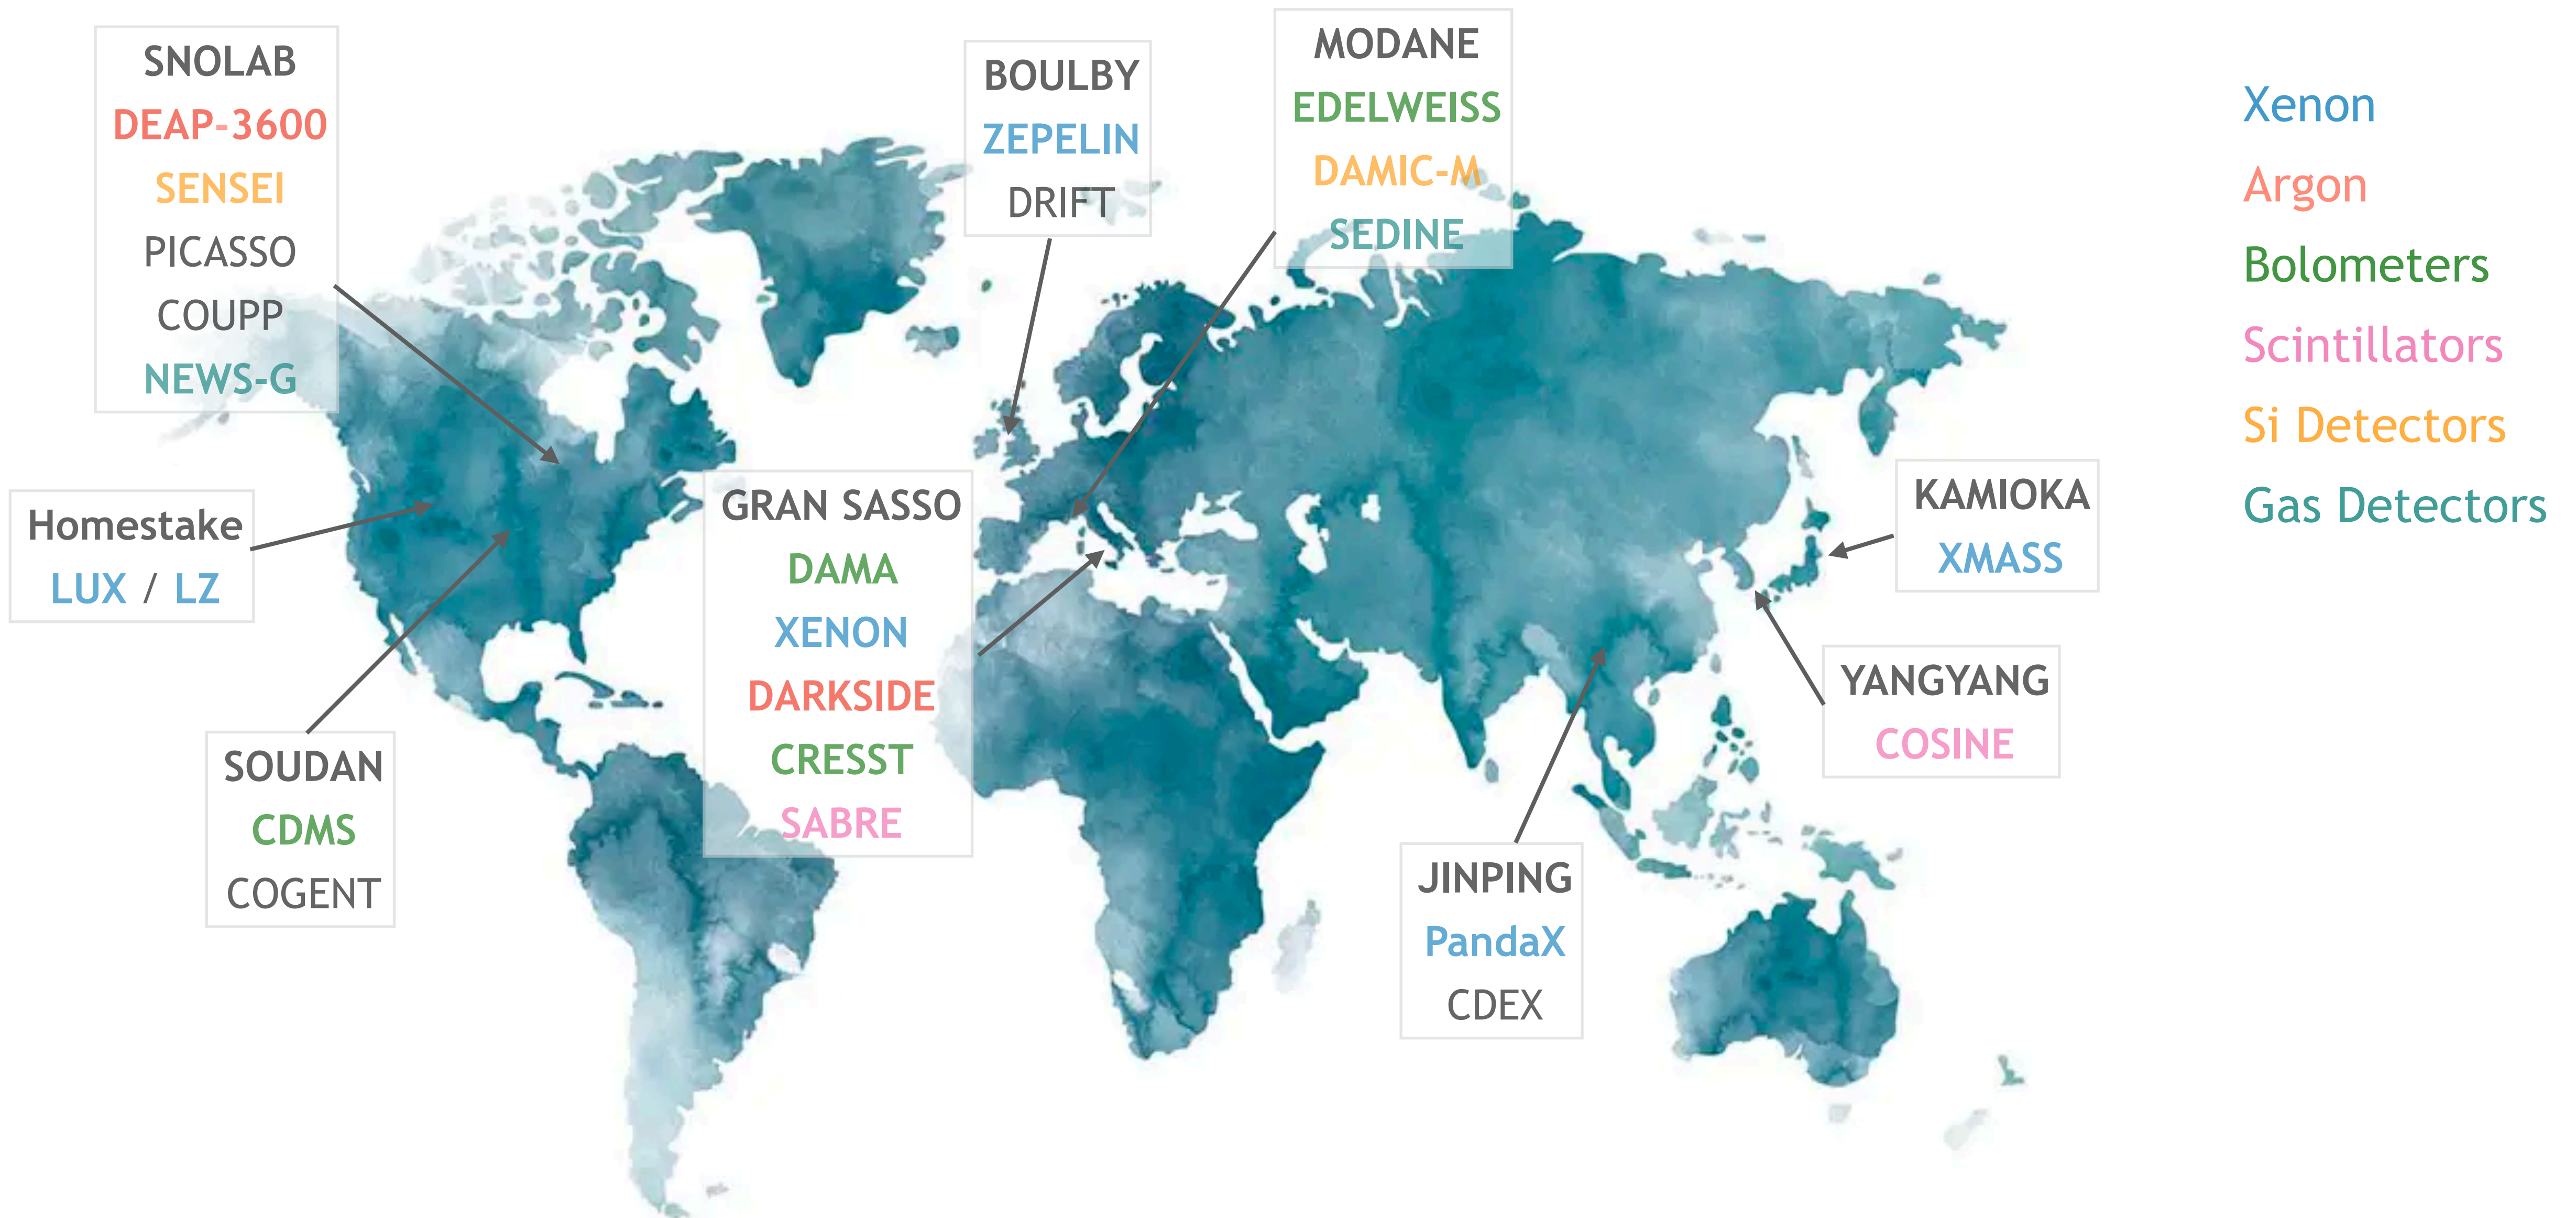

## WIMP detector requirement:

- **Massive** target
- **Low-energy** threshold
- **Ultra-low** background
- Signal/background **discrimination**

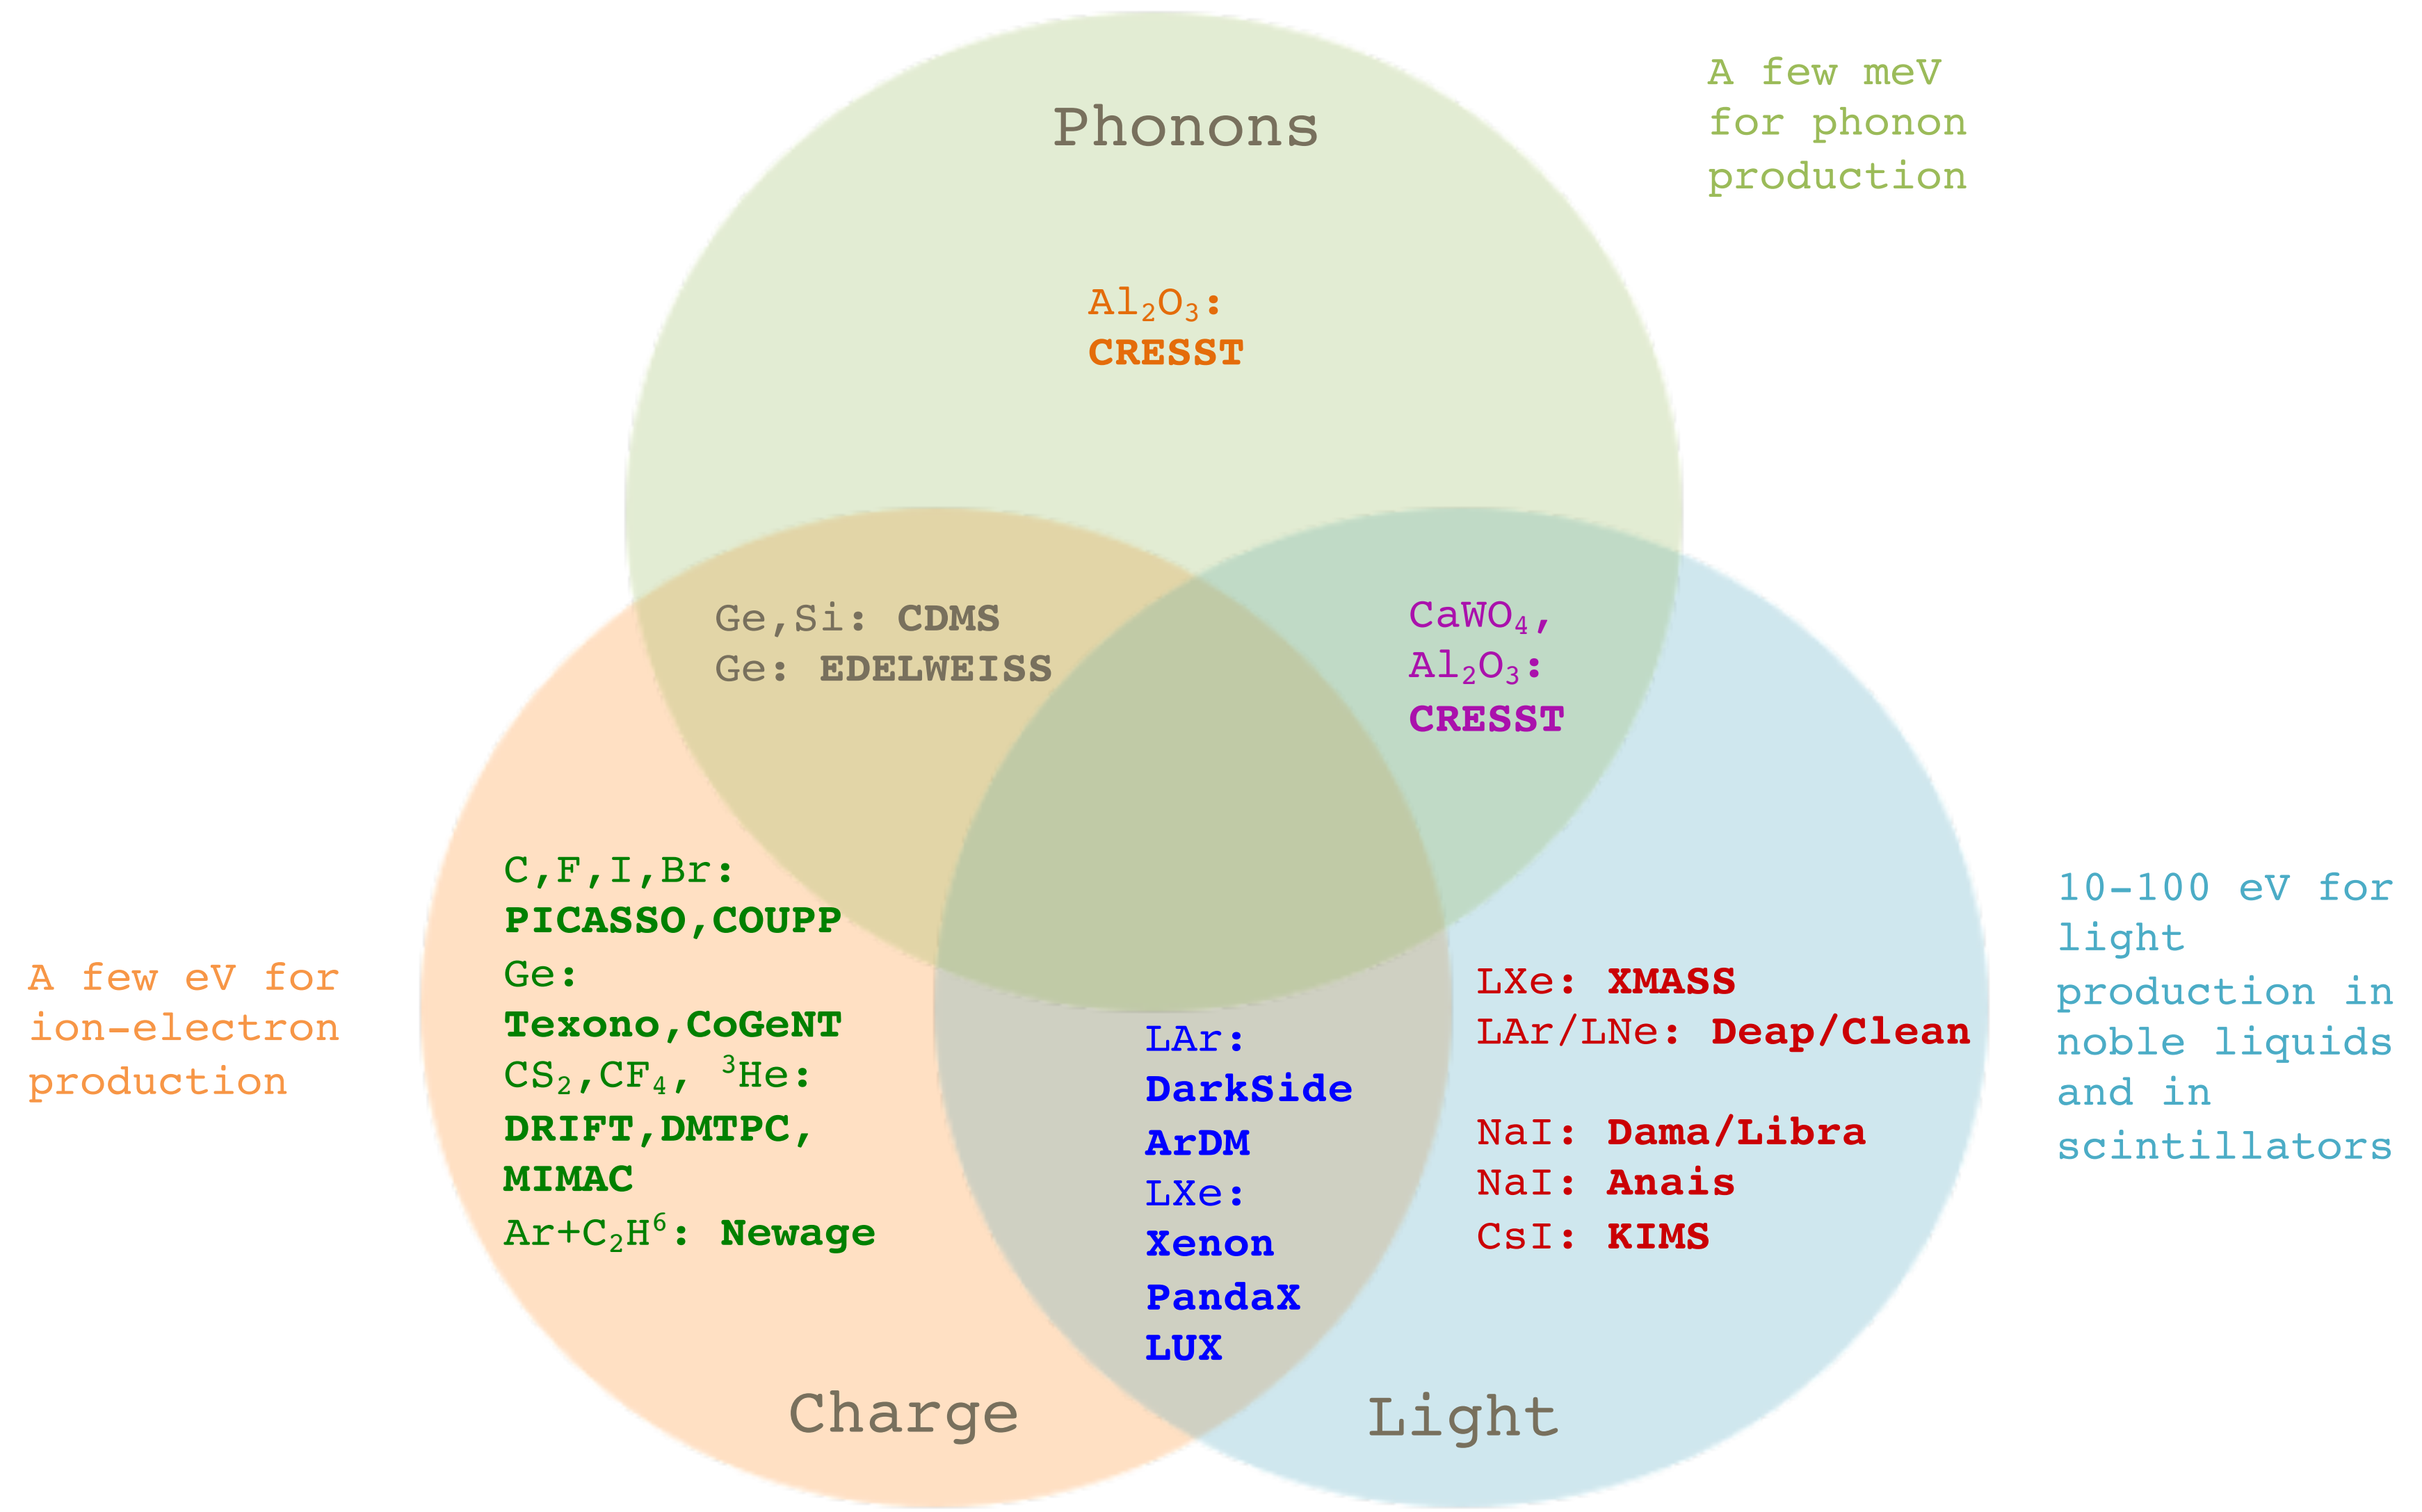

# Dark Matter Experiments

# Direct Detection Techniques

# The DAMA/LIBRA modulation

e-Print: 2110.04734

- Annual modulations with high radio-purity **NaI crystals**
- Exposure: 2.86 ton/year
- Phase: compatible with June 2nd within  $2\sigma$
- Evidence at  $\sim 14\sigma$

Period =  $0.99834 \pm 0.00067$  yr  
 Phase =  $142.4 \pm 4.2$  d (expected 153)

2-6 keV

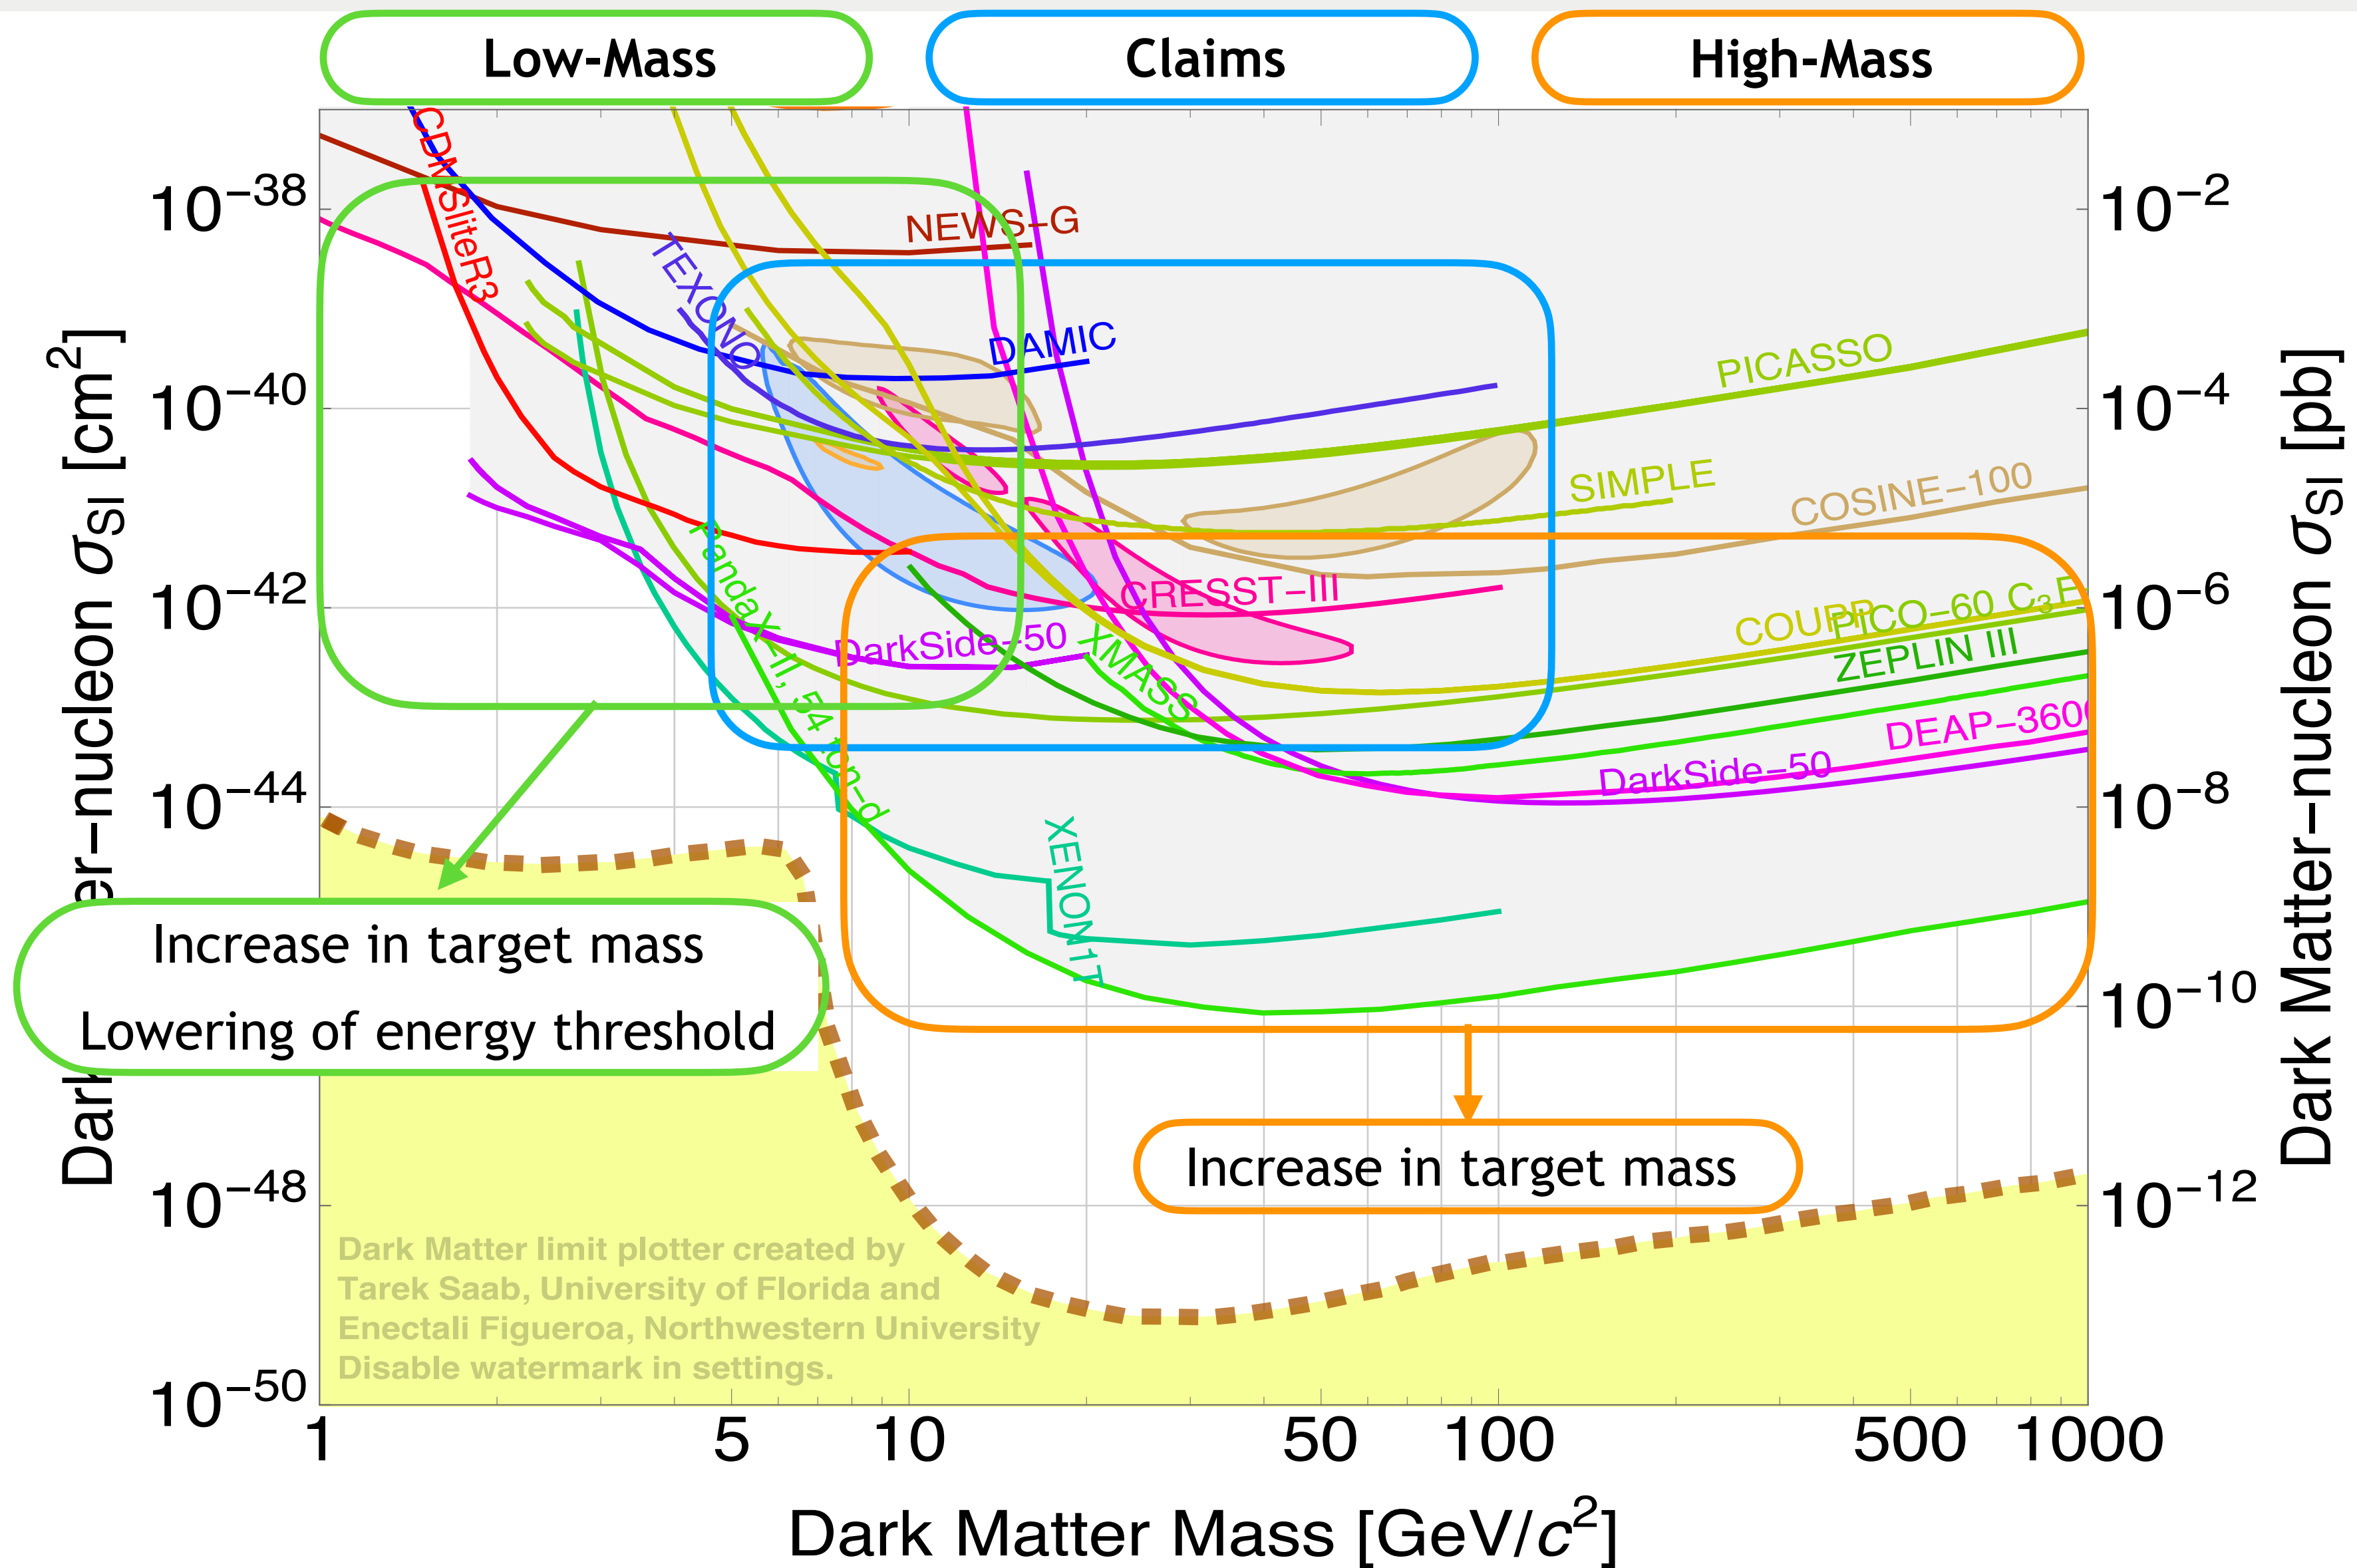

# State of the Art

# State of the Art

# Bolometers: Phonons vs Photons

## Characteristics

- Operating at mK temperature
- Excellent energy resolution
- Very low thresholds >0.2 keV
- Limited crystal sizes (4 g - 1.4 Kg)
- Good discrimination with phonon vs light/charge

**CRESST-III:** at Gran Sasso lab (Italy)

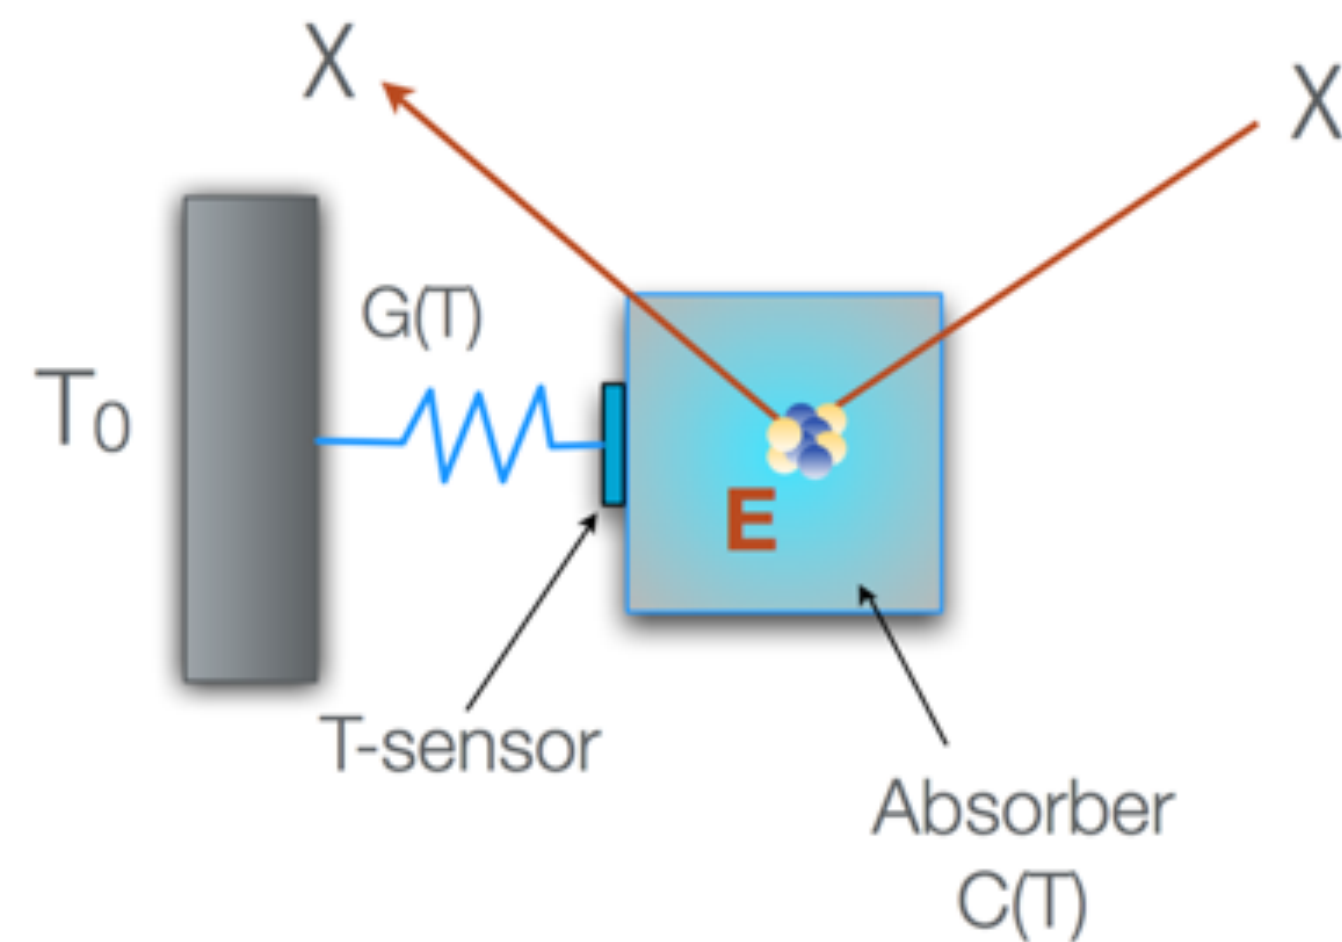

10 24 g  $\text{CaWO}_4$  scintillating bolometers at 15 mK

30 eV energy threshold achieved

Run 3 started on July 2020

→ best limits for WIMP-NR down to 160 MeV

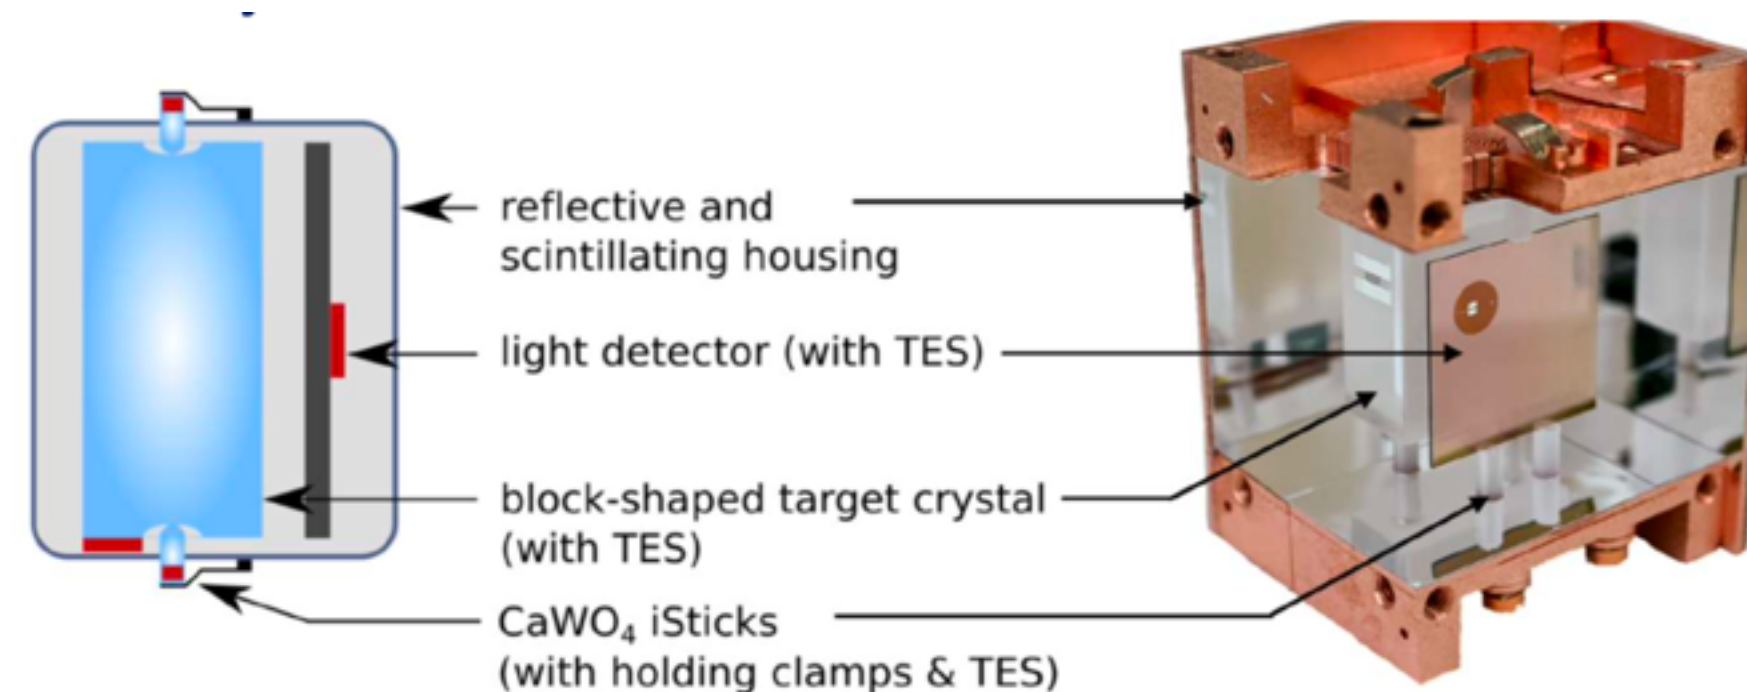

A.H. Abdelhameed et al, Phys. Rev. D 100 (2019) 102002

Phase 2:

100 crystals

Goal 10 eV threshold

# Bolometers: Phonons vs Charge

**EDELWEISS-III:** at Modane lab (France)

24 Ge detectors, 870 g each, 200 eV<sub>ee</sub> threshold

→ very good results at **5-30 GeV** and limits also on ALP

L. Hehn et al, Eur. Phys. J. C 76 (2016) 10 548

**EDELWEISS-subGeV:** above ground and at Modane

33 g Ge bolometers, 55 eV energy threshold (heat)

→ exploring DM mass down to **45 MeV with Migdal** + dark photons

E. Armengaud et al, Phys. Rev. D 99 (2019) 082003

Q. Arnaud et al, arXiv:2003.01046

**SuperCDMS:** at Soudan lab (US)

15 Ge detectors, 600 g each, 70 eV threshold

Exploiting the Neganov-Luke (NLT) effect at high bias voltage (HV) to convert charge into heat

→ results down to **1.5 GeV** from different analyses

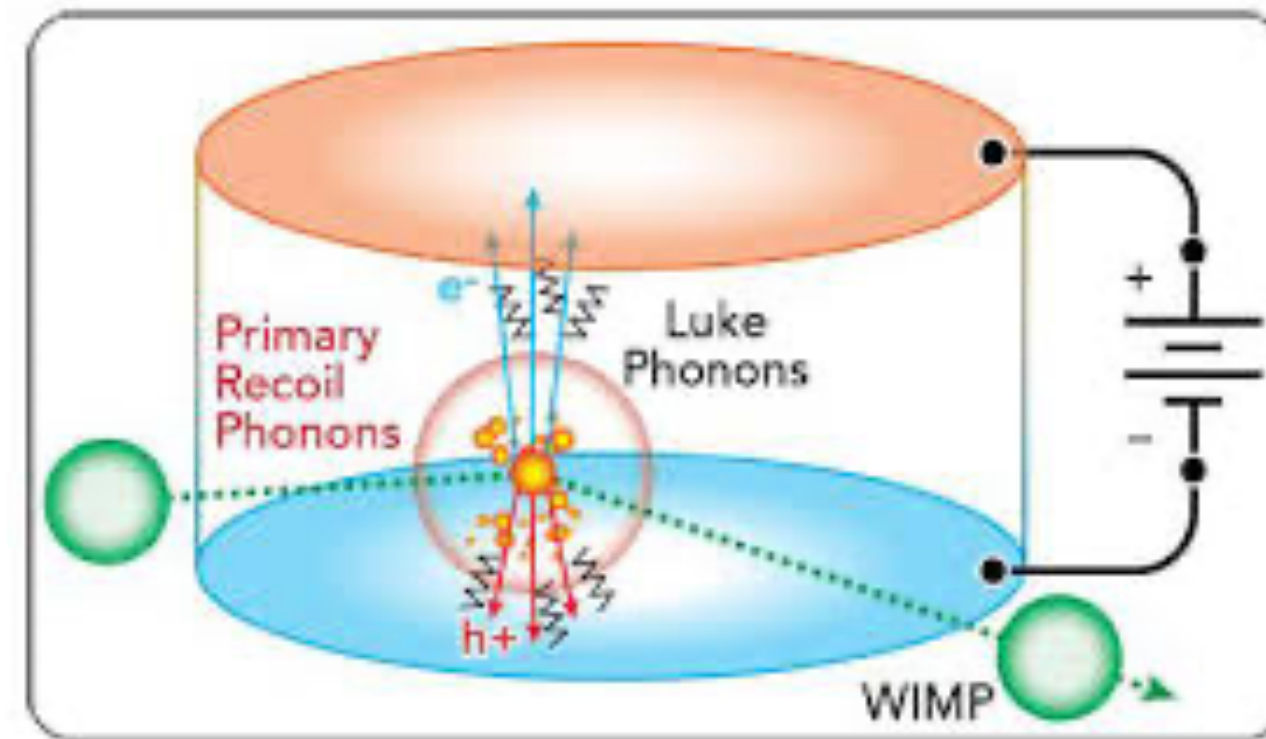

R. Agnese et al, Phys. Rev. Lett. 120 (2018) 061802; Phys. Rev. D 99 (2019) 062001

0.93 g / 10.6 g Si detectors on surface → results on e- scattering and dark photons / nucleon scattering

D. W. Amaral, et al, arXiv:2005.14067, I. Alkhatib et al, arXiv:2007.14289

**SuperCDMS:** at SNOLAB (Canada)

Start mid-2021, 30 kg, Ge and Si NTL detectors

# Low-Mass: CCDs

**Silicon charge-coupled devices (CCDs):** charge produced in the interaction drifts towards the pixel gates, until readout.

- + 3D position reconstruction possible: interaction correlated from charge diffusion
- + Effective particle identification and background rejection

## DAMIC at SNOLAB

- 7 CCDs (6 g each) since 2017 - Threshold 50 eV<sub>ee</sub>
  - results also on e scattering and hidden photon DM [PRL 118, 141803 \(2017\)](#); [PRL 123 \(2019\) 181802](#)
  - recent on nucleon scattering from 11 kg day: excess of ionization events at 50-200 eV<sub>ee</sub>? [A. Aguilar-Arevalo et al, arXiv:2007.15622](#)

## DAMIC-M at Modane

- 50 CCDs (13.5 g each) for kg-year exposures - Commissioning in 2023. → **Skipper readout:** reduce noise and achieve single electron counting with high resolution

## SENSEI at Fermilab

- Prototypes with 0.0947 g and 2 g total active mass at MINOS Hall (100 m underground) → constraints on e scattering and hidden-sector candidates
- Proposal to install a 100-g detector (48 CCDs) at SNOLAB

**OSCURA:** 10 kg in 2027

# Spherical gaseous detectors

**Spherical Proportional Counter:** very low energy threshold and very low capacitance ( $<1$  pF). Anode: small ball at the center, avalanche region.

I. Giomataris et al, JINST 2008 P09007

- **SEDINE detector at Modane**
- 60-cm NOSV copper sphere
- Filled with Ne-CH<sub>4</sub>(0.7%) at 3.1 bar (280 g active mass)
- 42 d WIMP search run, 50 eVee threshold  
Q. Arnaud et al, Astropart. Phys. 97, 54 (2018)

## NEWS-G at SNOLab

- 140-cm low activity copper sphere, built in France, commissioning data with CH<sub>4</sub>, now at SNOLAB.
- Lighter targets: H, He
- Single electron response (gain, drift and diffusion times, ...)
- Q. Arnaud et al, Phys. Rev. D 99 (2019) 102003

# Perspectives in the low-mass range

# Noble liquids: Xenon vs Argon

	LAr	LXe
WIMP SI cross section	<b>Lower cross-section =&gt; need more massive target</b>	<b>Higher-cross section</b>
WIMP SD cross section	<b>Not accessible</b>	<b>Accessible</b>
Kinematics	<b>Lighter nucleus and higher scintillation efficiency: low ionization threshold</b>	Heavier nucleus and higher quenching: >1 GeV/c <sup>2</sup>
Radio-purity	<sup>39</sup> Ar contamination (fixed: see next slides)	<b>Intrinsically pure</b>
Density	1.4 g/cm <sup>3</sup>	<b>3.1 g/cm<sup>3</sup></b>
Temperature	<b>87.2 K</b> (close to nitrogen)	166.4 K
S1 Pulse Shape Discrimination	<b>Yes (singlet ~7 ns; triplet ~1600 ns)</b>	Very limited (singlet: ~2 ns; triplet: ~27 ns)
Cost and availability	<b>Generically cheap</b> (~\$/kg) + <b>extra costs</b> for underground extraction <b>Abundant</b>	<b>Expensive</b> (~kDollar/kg) <b>Limited</b> world production

# Dual-phase Time Projection Chamber

**Particle discrimination** through:

- Accurate 3D position identification
- Multiple-scattering rejection
- S2/S1 ratio
- S1 PSD (if available)

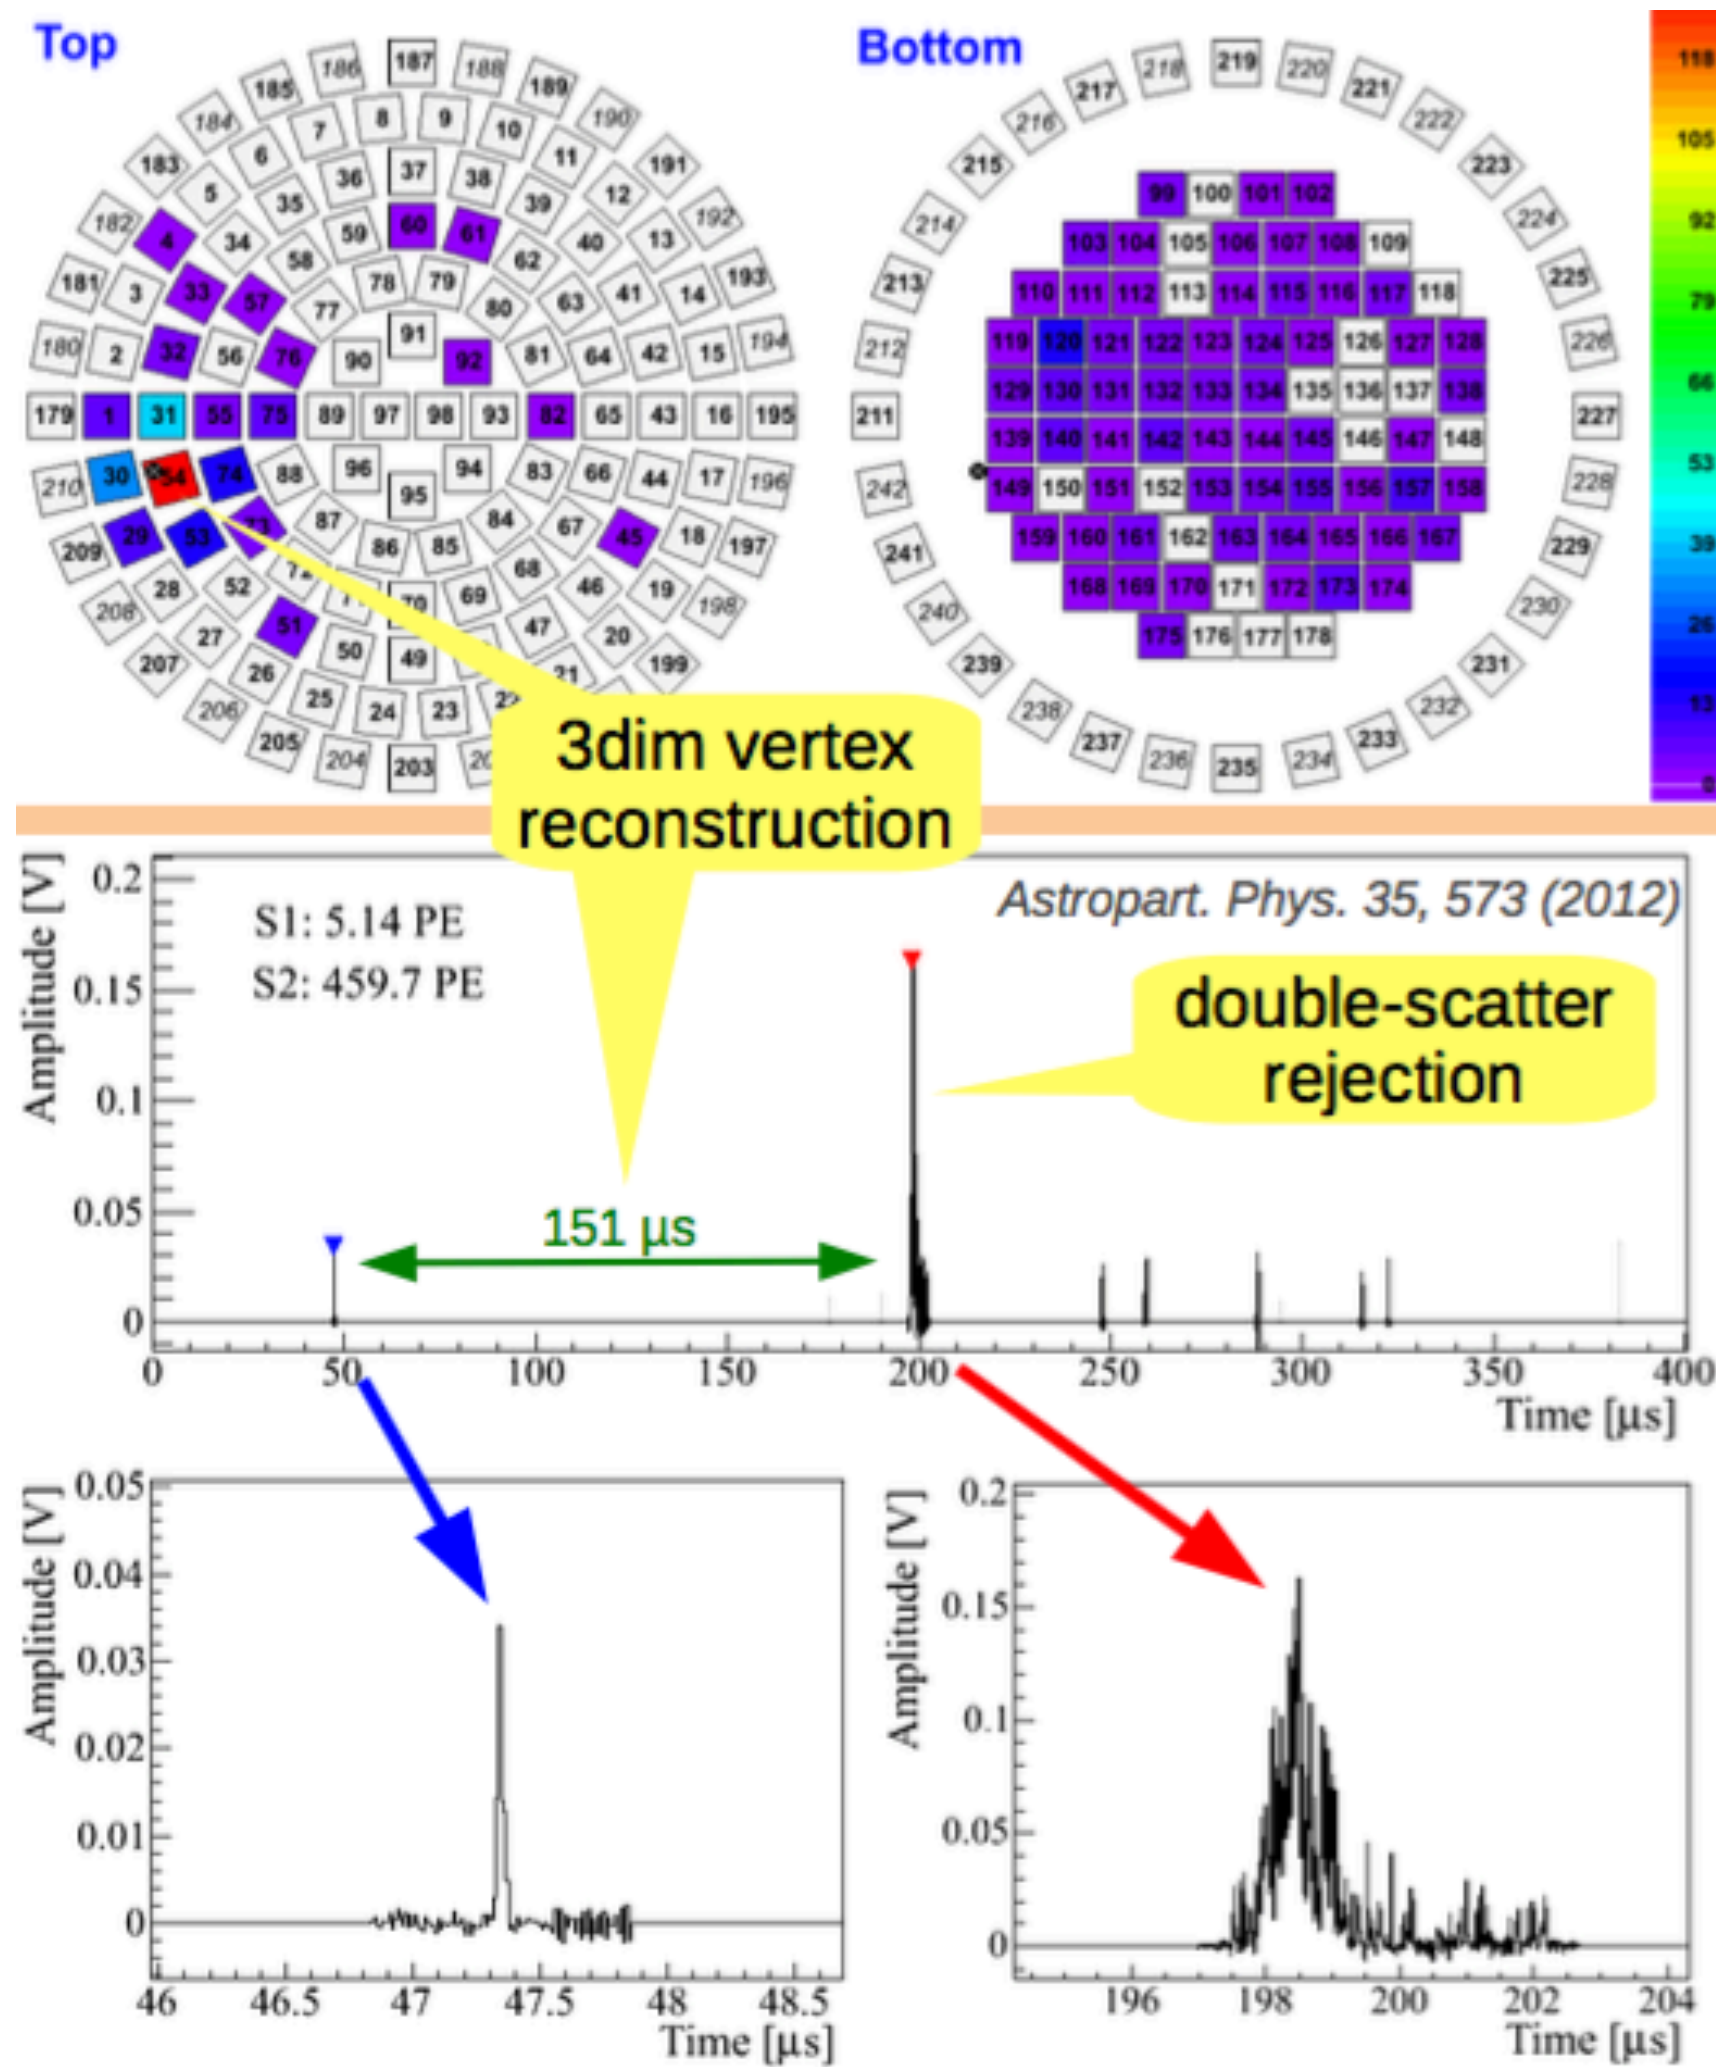

# Event Topology

## Multiple Scatter Rejection

## S2/S1 Particle Discrimination

# LXe High-Mass Results: PandaX-4T

## S2-only analysis

- S1 detection efficiency  $\sim 10\text{-}20\%$   $\Rightarrow$  dropped
- Ionization electron amplification factor  $\sim 10\text{-}30$

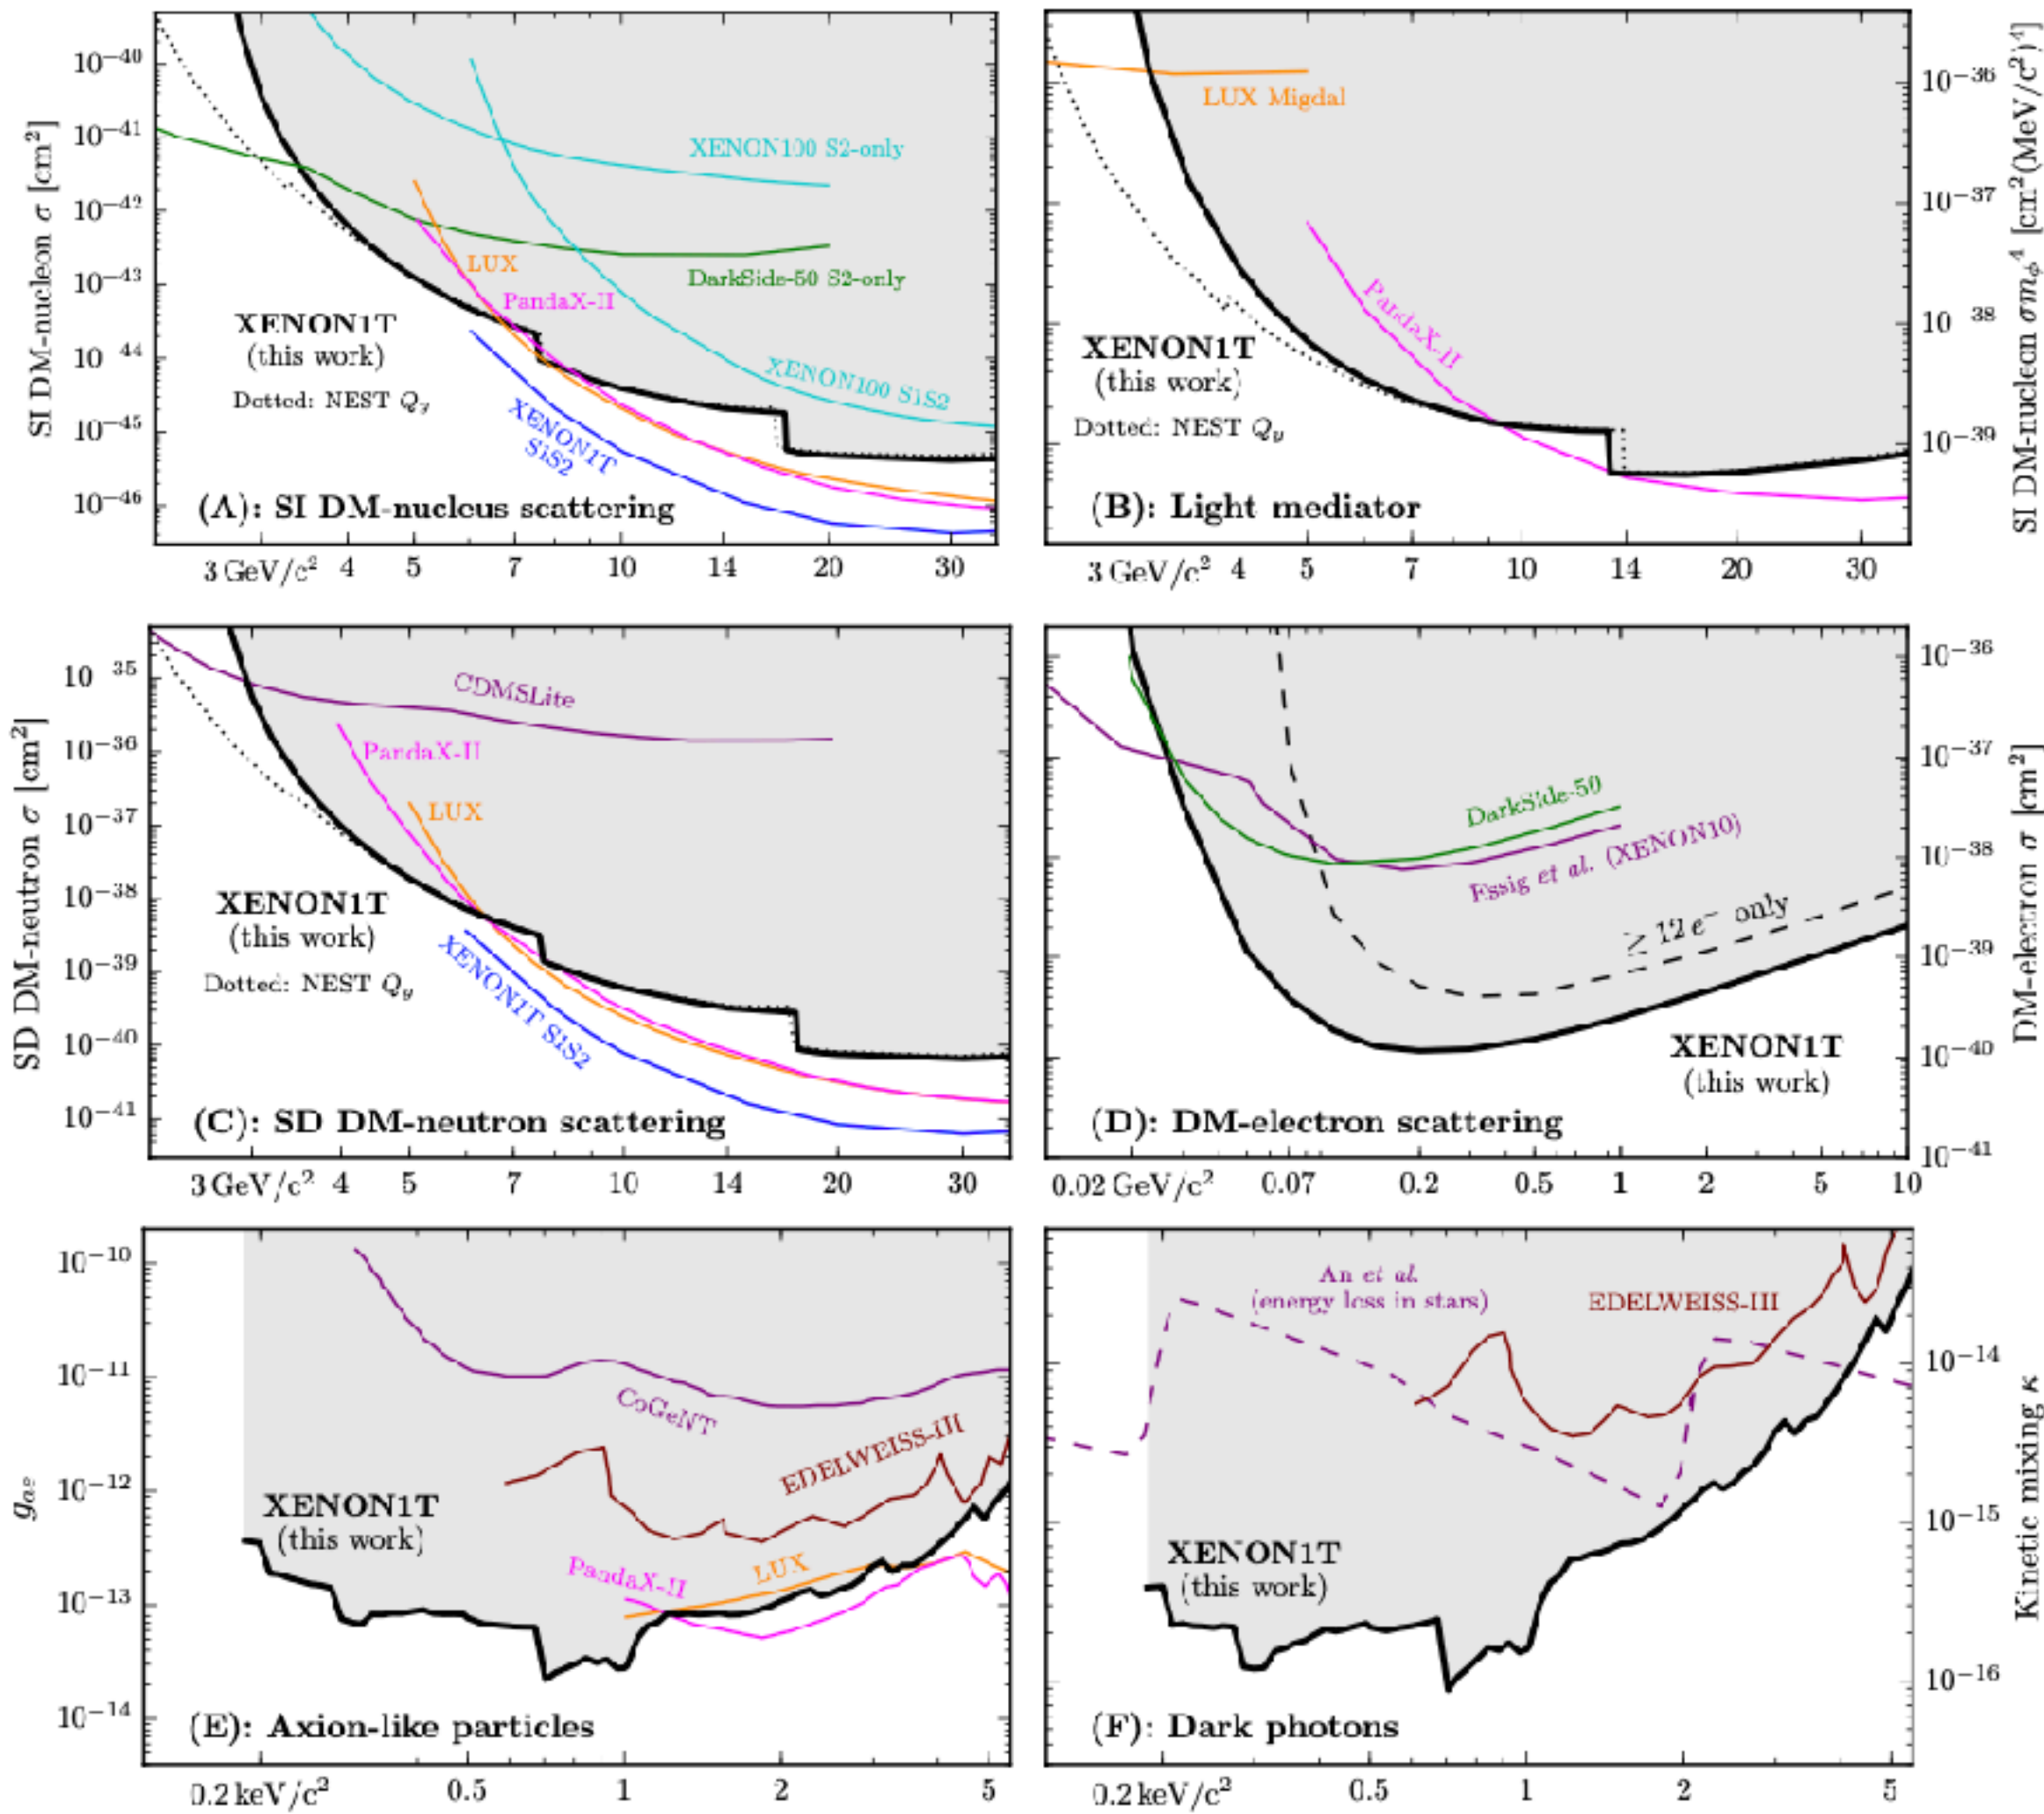

- Very low threshold
- Quite high-resolution
- Very massive if compared with solid-state detectors
- Much higher radiopurity
- Limited background discrimination (only multiple scatters rejection)

# SI, SD, Lephophilic, and Migdal Effect

# The XENON1T excess

### Data Excess

0.65 tonne-years with only  $76 \pm 2$  events/(tonne × year × keV) between 1-30 keV

### (a) Tritium

### (b) Solar axion

### Radon Calibration (no excess)

### (c) Neutrino magnetic moment

### (d) Solar axion vs. tritium background

# LAr: DarkSide and the $^{39}\text{Ar}$ issue

SOLVED

## URANIA

- $^{39}\text{Ar}$  produced from cosmic ray interactions primarily from  $^{40}\text{Ar}$  in the atmosphere
- $^{39}\text{Ar}$  activity in atmospheric LAr  $\sim 1\text{Bq/kg}$
- LAr extracted from Colorado  $\text{CO}_2$  wells  $\sim 0.7\text{ mBq / kg}$

## ARIA

- cryogenic isotopic distillation plant
- being installed in a mine shaft at CarboSulcis, S.p.A. in Nuraxi-Figus (SU), Italy
- cryogenic isotopic distillation plant
- being installed in a mine shaft at CarboSulcis, S.p.A. in Nuraxi-Figus (SU), Italy
- 350m tall distillation column
- designed to reduce  $^{39}\text{Ar}$  isotopic fraction in UAr by factor 10 per pass

# The LAr Pulse Shape Discrimination

LAr scintillation times:

- singlet ~ 6 ns
- Triplet ~ 1600 ns

Singlet-to-triplet ratios:

- Nuclear recoils ~ 0.7
- Electron recoils ~ 0.3

Very distinctive (and unique) signatures to separate electron recoils from nuclear recoils

Background-free over more than 530 days!

# The S2-only analysis with DarkSide-50

### NR ionization response

### ER ionization response

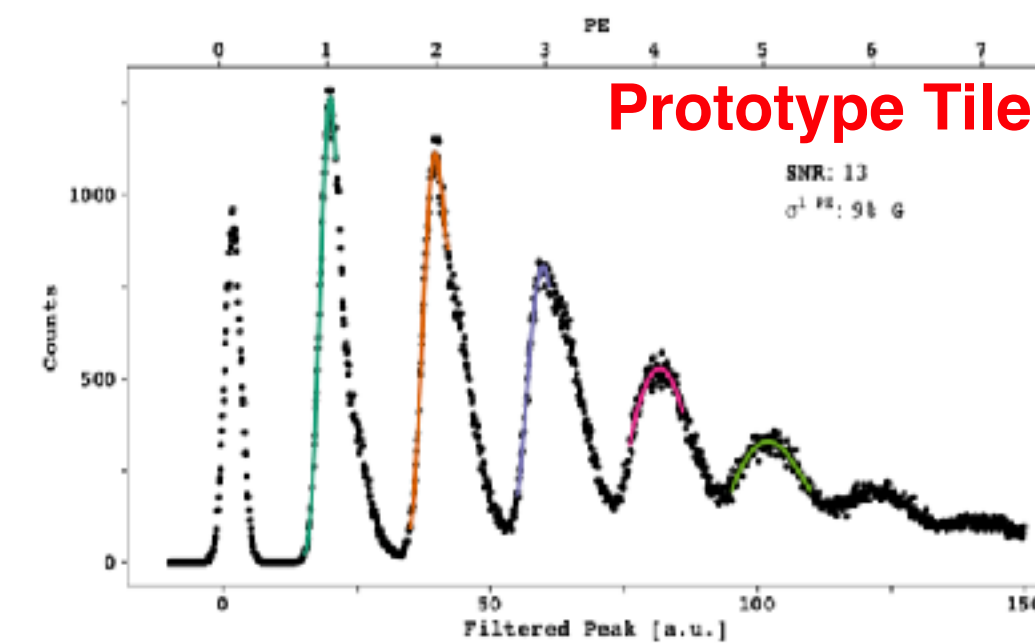

# New technologies with DarkSide-20k

- The TPC directly immersed in a LAr bath (600 ton)  
=> minimisation of TPC materials and hence contamination
- Equipped with 15 m<sup>2</sup> of SiPM (~200,000 SiPM)
- Gd-acrylic veto

	DS-20k requirement	SiPM tile (PDM)	
Surface	5x5cm <sup>2</sup>	24cm <sup>2</sup> prototype 25cm <sup>2</sup> final PDM	✓
Power dissipation	<250mW	~170mW	✓
PDE	>40%	50% · ε <sub>geom</sub> = 45%	✓
Noise Rate	<0.1cps/mm <sup>2</sup>	0.004cps/mm <sup>2</sup>	✓
Time Resolution	O(10ns)	16ns	✓
Dynamic Range	>50	~100	✓

# Noble Liquids

Today

2022-2032

## Light-dark matter candidates

- Several channels to explore (WIMP-NR + Migdal, leptophilic, dark photons, axions)
- Several experiments / different techniques
  - Solid-state cryogenic detectors: scintillating bolometers, small mass Ge and Si crystals.
  - Liquid noble detectors (Xe, Ar): operated in S2 only mode
  - Purely ionization detectors: Ge, CCDs, gas detectors
  - Bubble chambers

## High-mass WIMPs:

- the community is moving towards two large experiments based on LXe (e.g. DARWIN) and LAr (e.g. ARGO)
- Need of LXe / LAr complementarity
- In about 10 years we will reach the neutrino floor: **what next?**

# Dark Matter Particles?

## AXION ?

- Solve CP problem in QCD

## Sterile Neutrino ?

- Natural candidate

## WIMP ?

- Supersymmetry (getting weaker...)
- Naturally matches current DM density
