Elbereth Conference

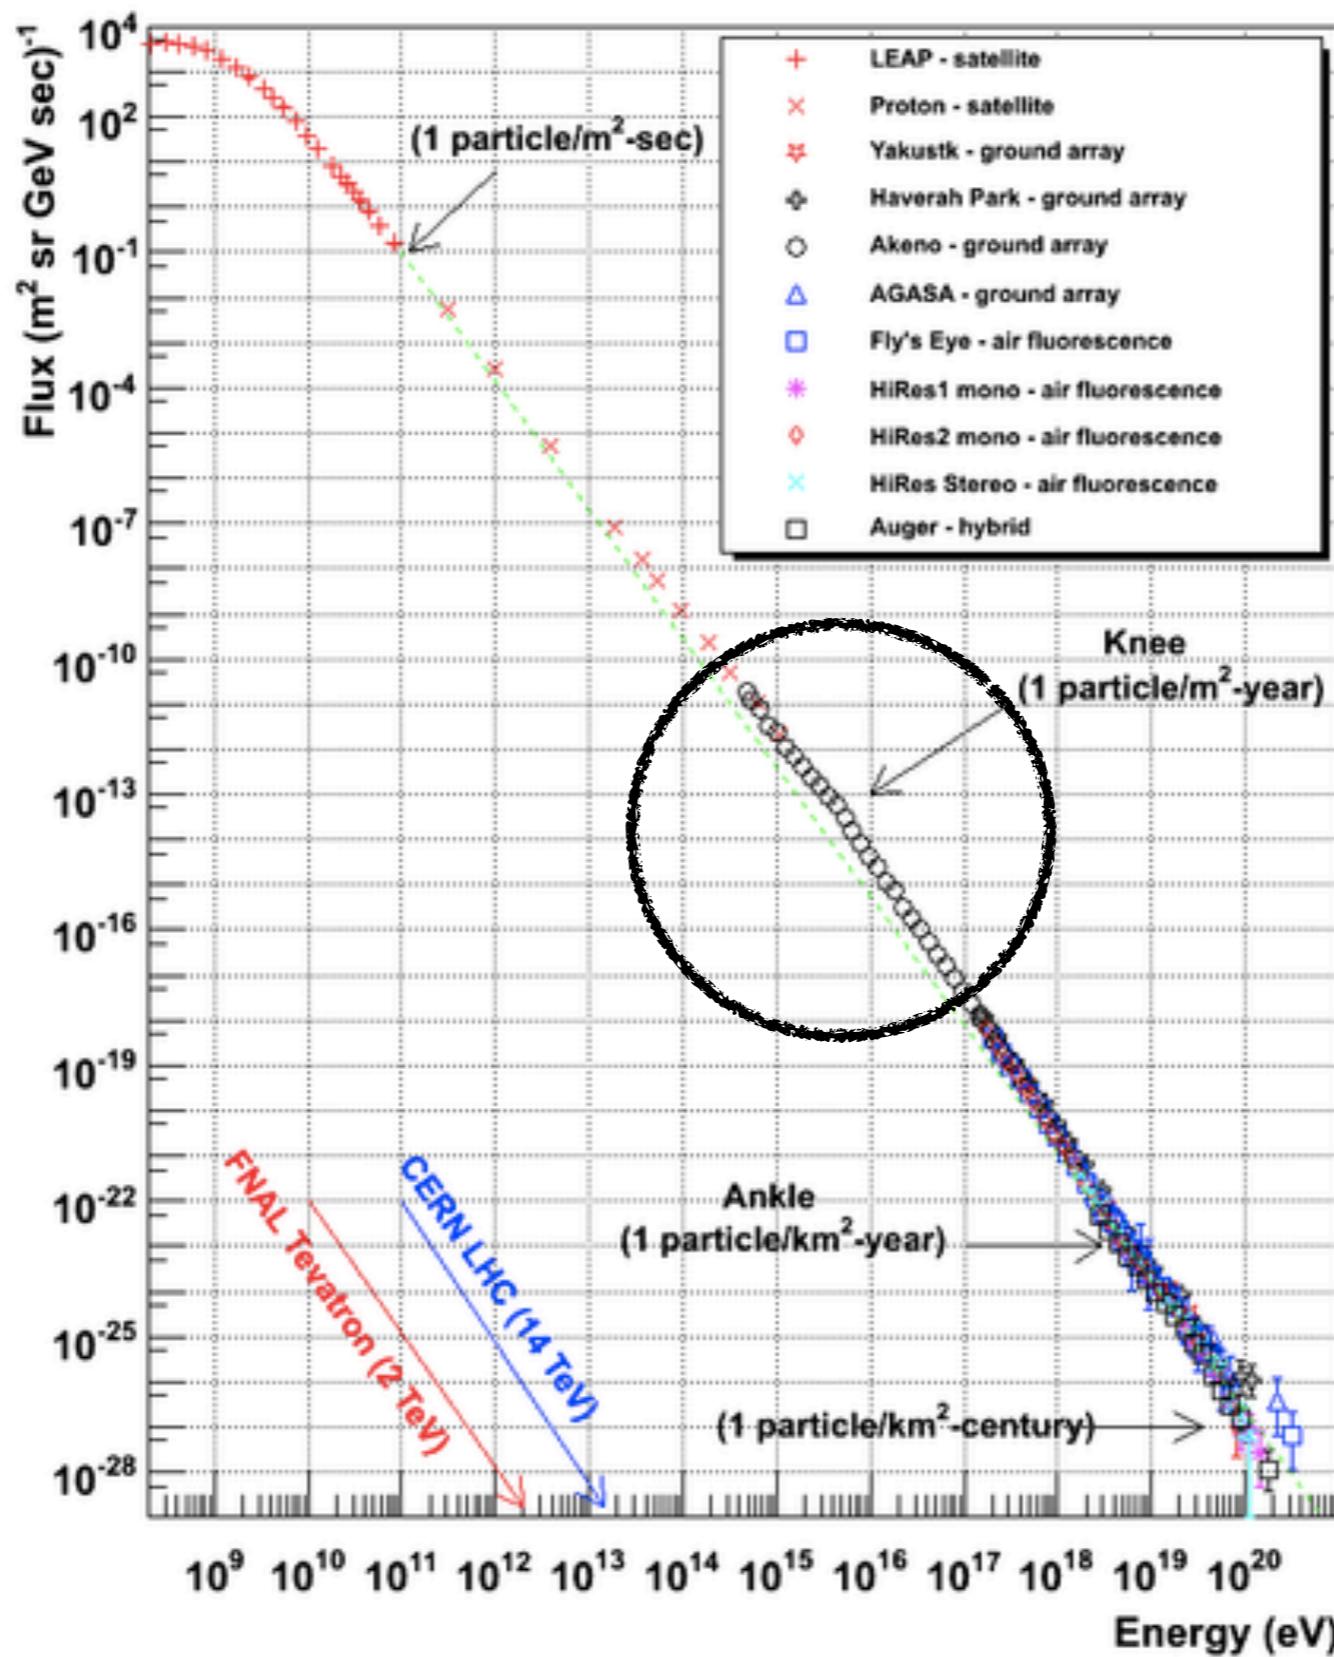

February 28th 2020

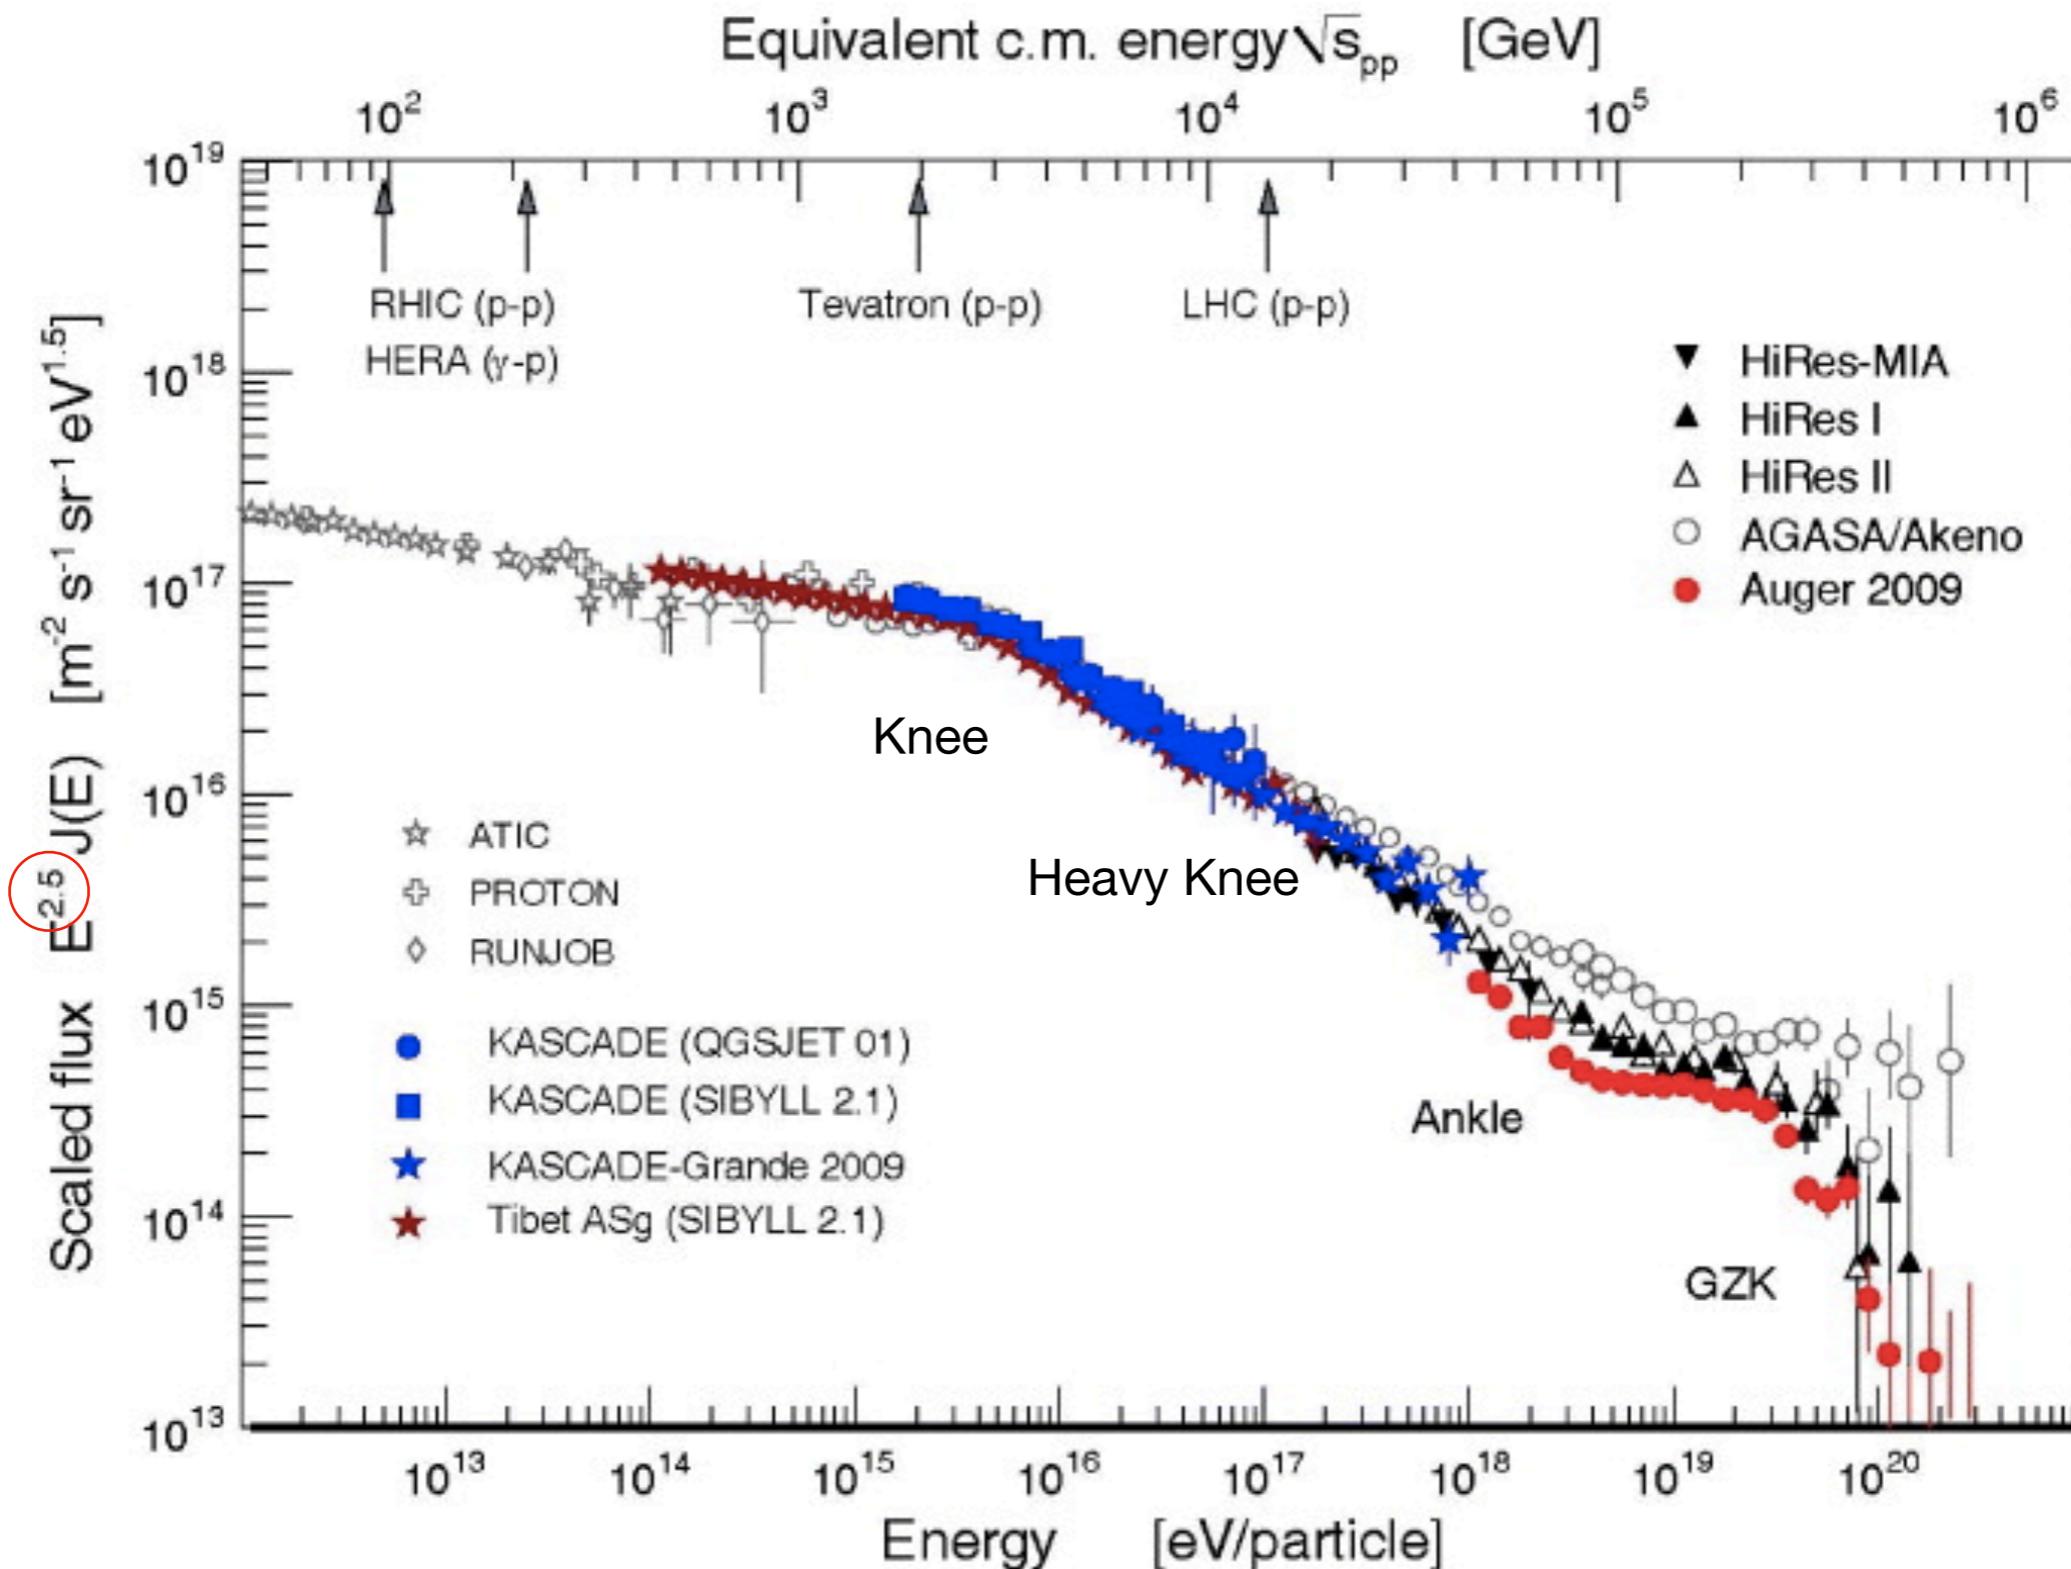

Part I

Cosmic rays

Introduction (Motivations)

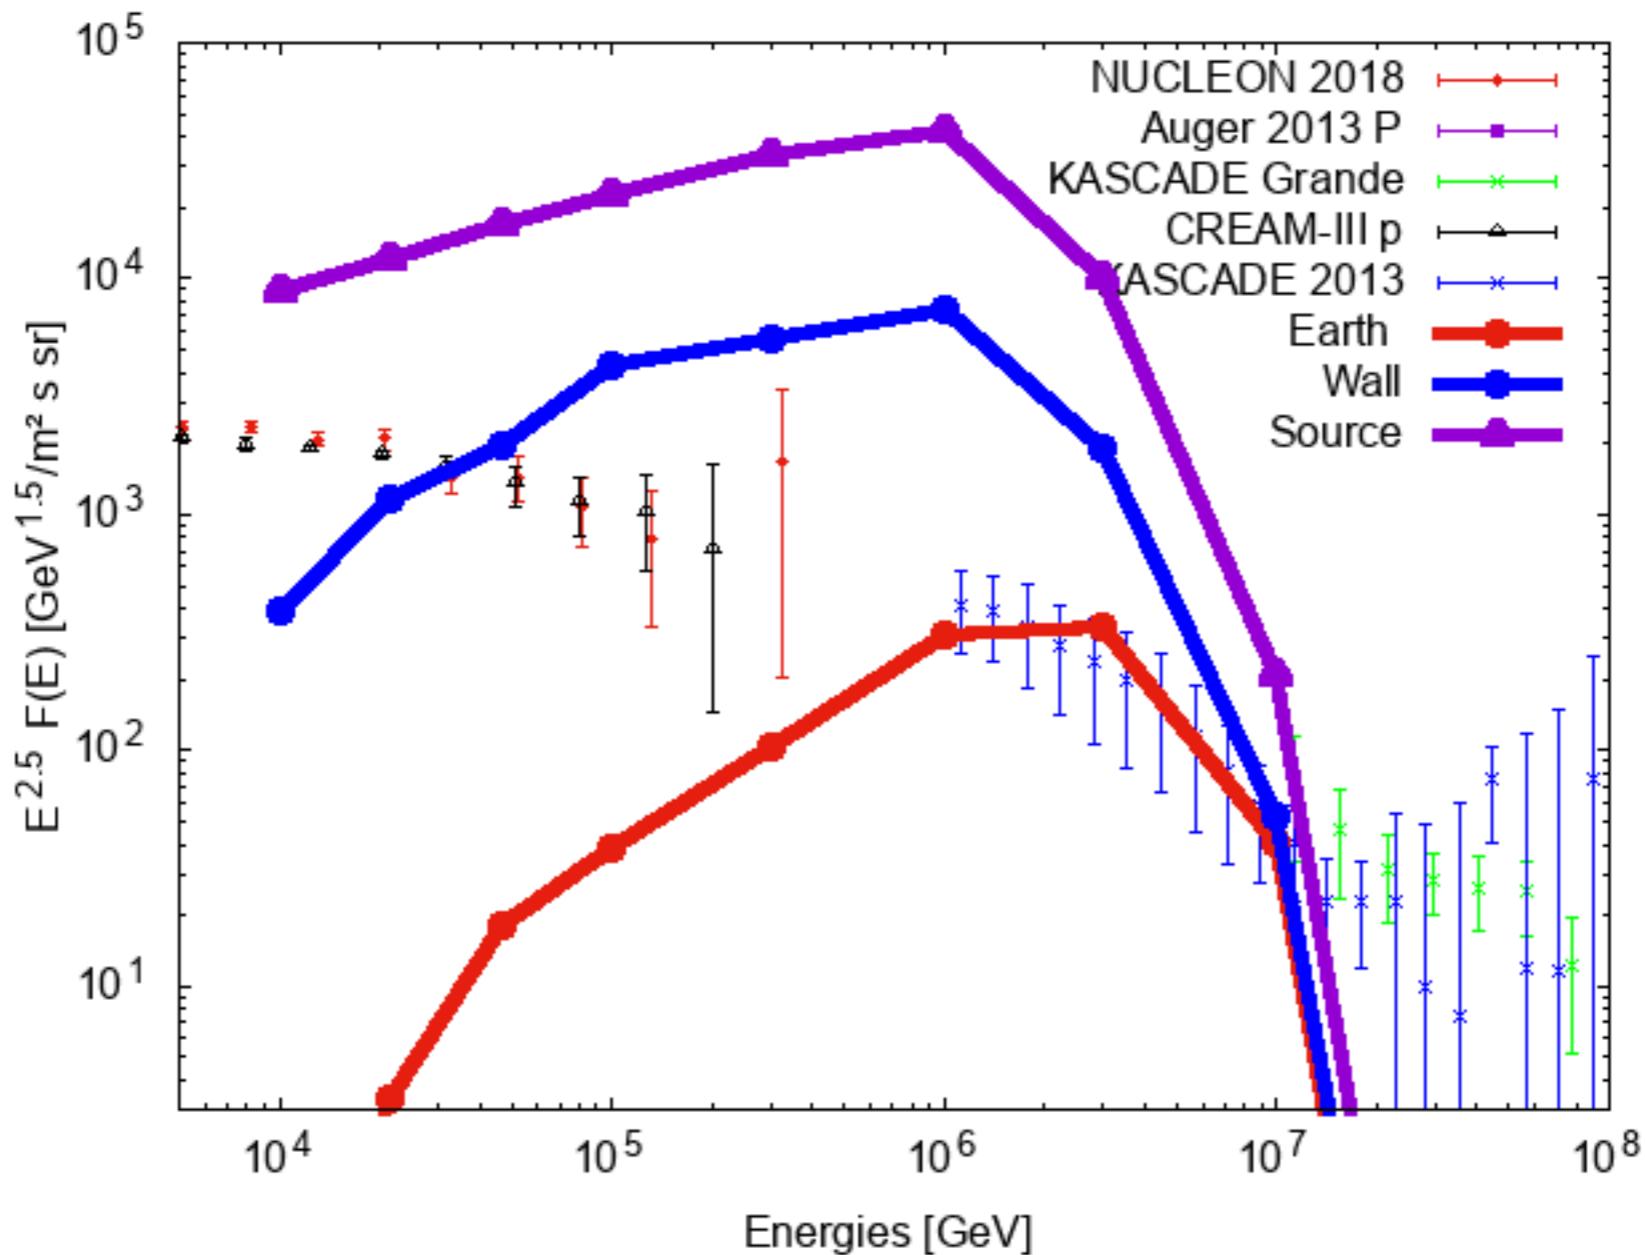

Introduction (Motivations)

Introduction (Explanations)

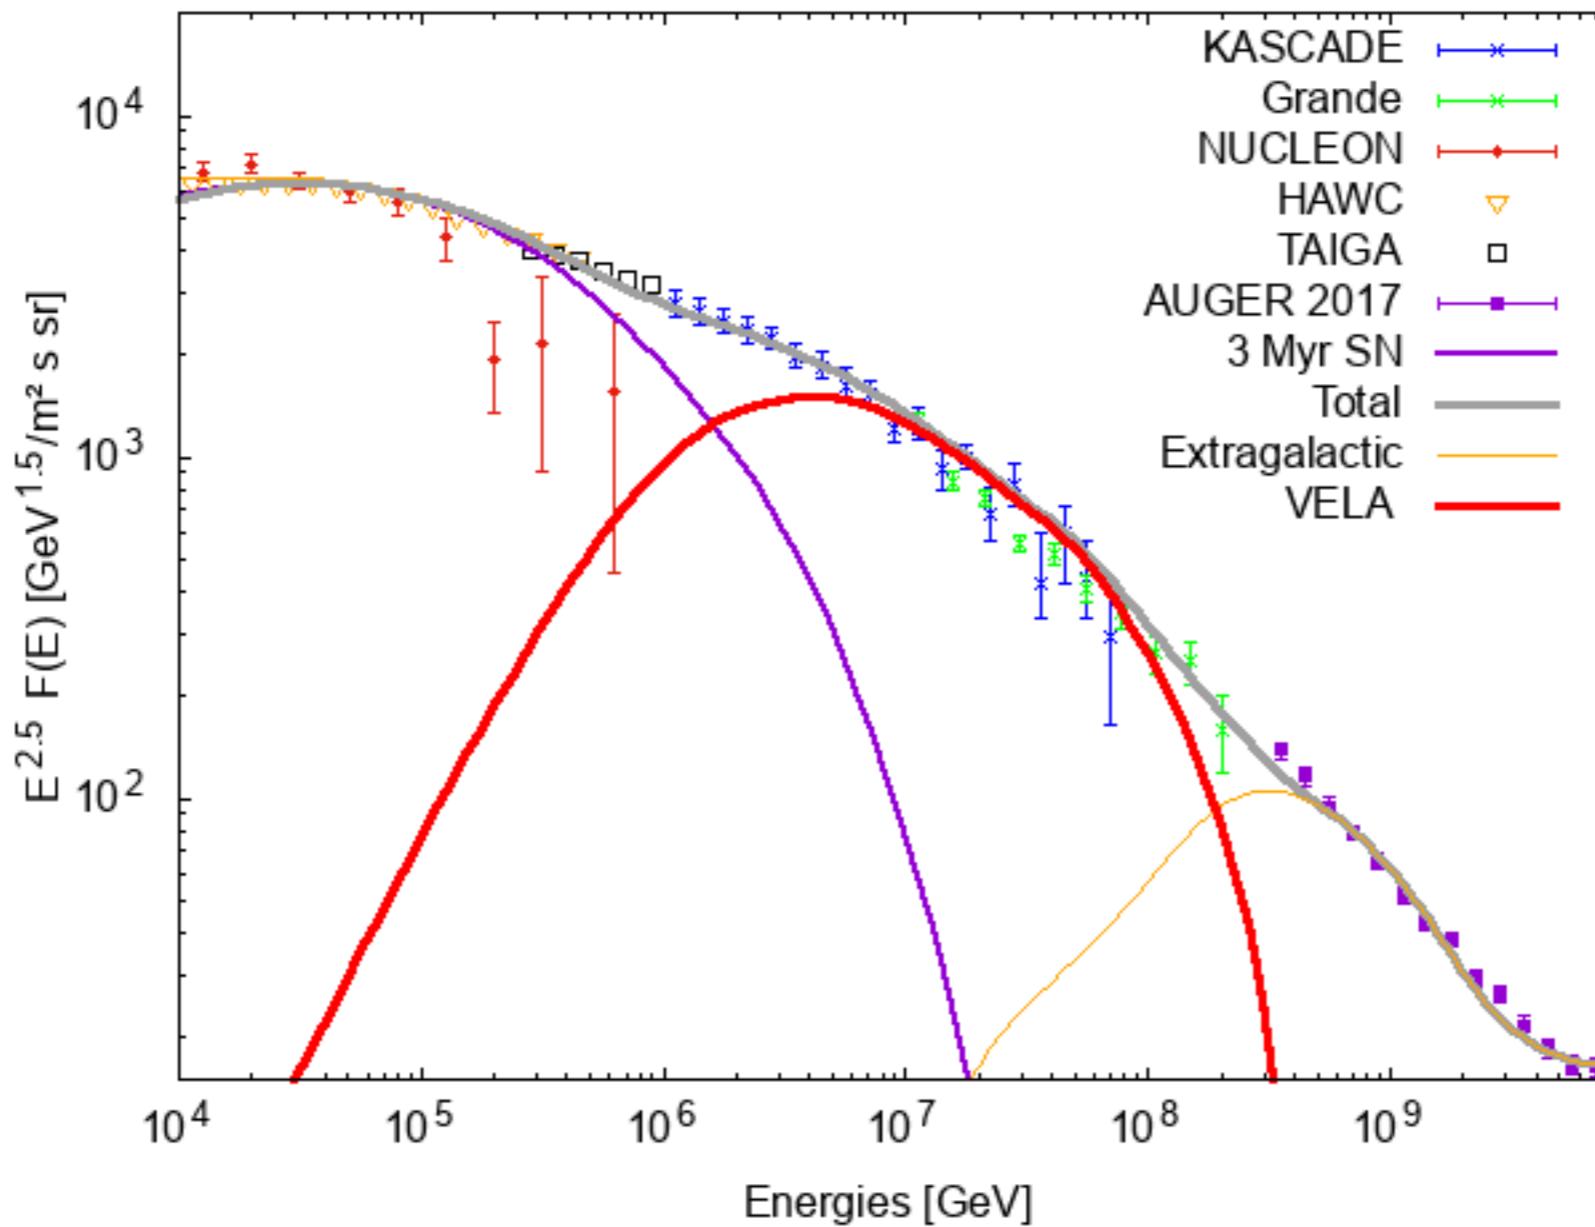

- Interaction changes in the multi-TeV region (excluded by LHC)
- Change of the diffusion properties of charged CR (V.L.Ginzburg and S.I.Syrovatskii 1964 , V.S.Ptuskin et al. 1993) (more on arXiv 1403.3380v2)
- Dominant contribution of one single nearby source (A.D. Erlykin and A. W. Wolfendale 1997)

Results (Proton flux on earth wall and source)

Part II

Neutrinos
&
Gamma rays

Introduction (Motivation)

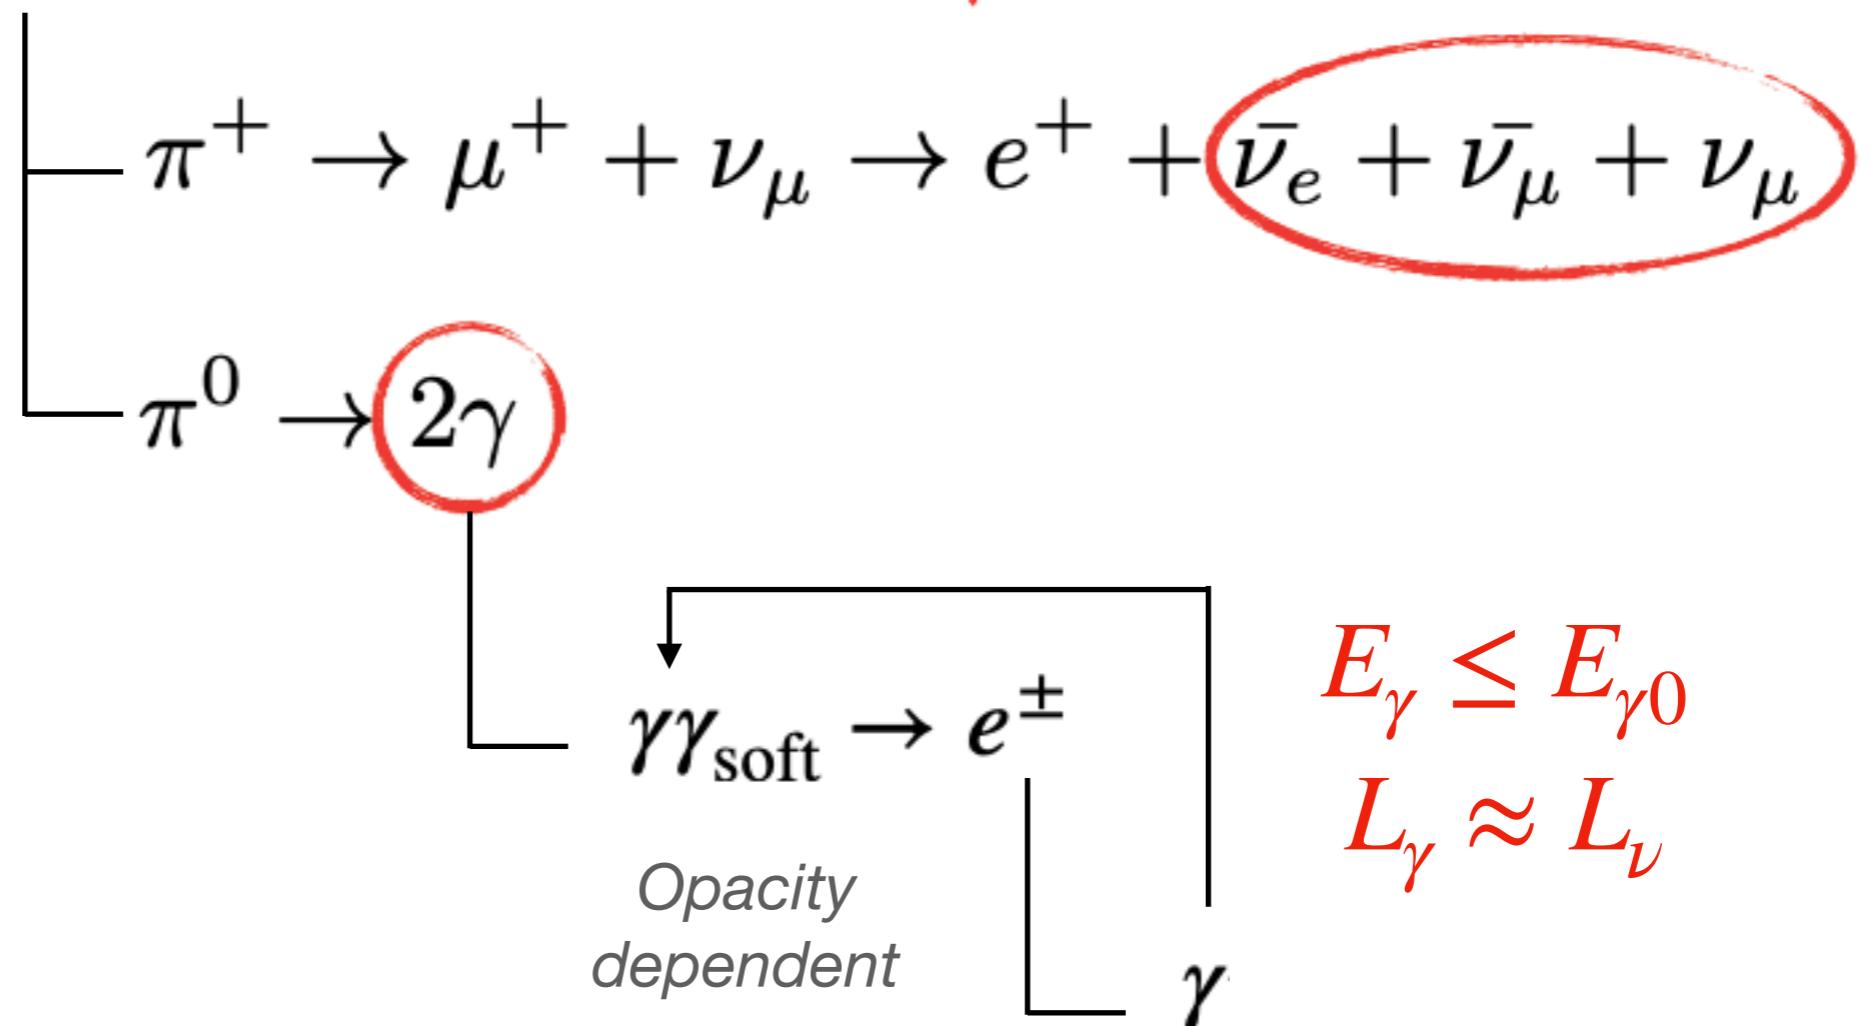

$$p + p \rightarrow \pi + X$$

$$E_{\nu 0} \approx E_p / 20$$

$$E_{\gamma 0} \approx E_p / 10$$

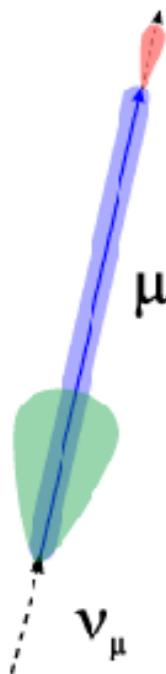

$$E_{\gamma 0} \approx 2 \times E_{\nu 0}$$

$$L_\gamma \approx L_\nu$$

Introduction (Explanations)

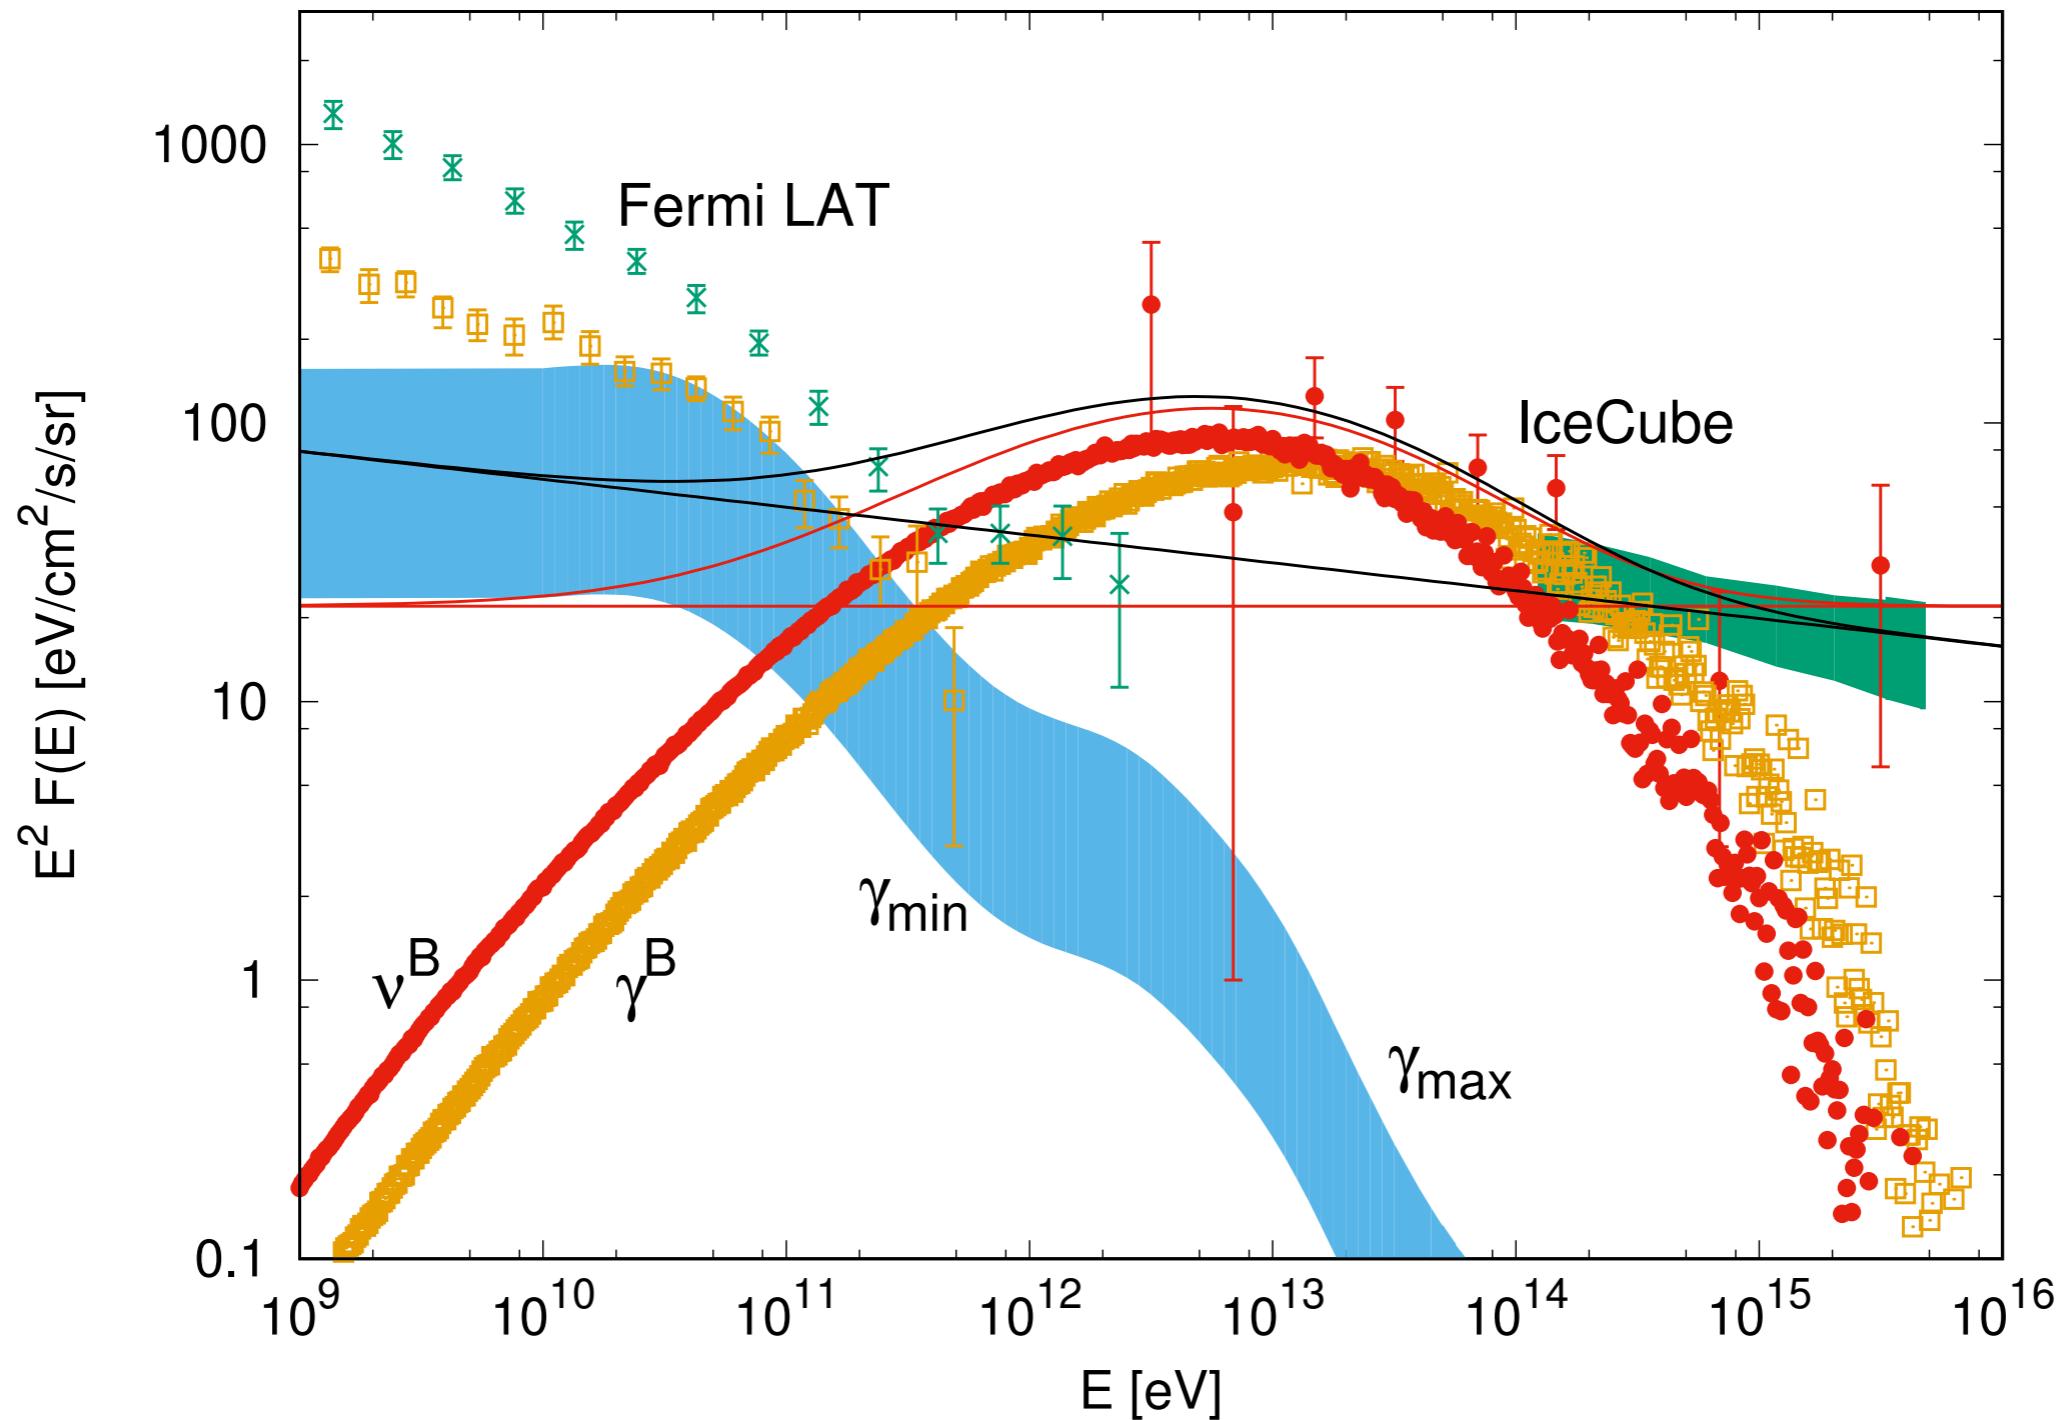

- Decay of Dark Matter particles (V. Berezinsky, M. Kachelriess, A. Vilenkin
arXiv:9708217)
- Cosmic ray interaction in the large halo of MW (A. M. Taylor, S. Gabici, F. Aharonian arXiv:1403.3206)
- **Interaction of cosmic rays injected by a young nearby supernova with local bubble**

Results (Proton flux on earth wall and source)

Results (neutrinos and gamma rays)

M.Kachelriess, D.Semikoz, B.M 2018 arXiv 2001.00768

Summary

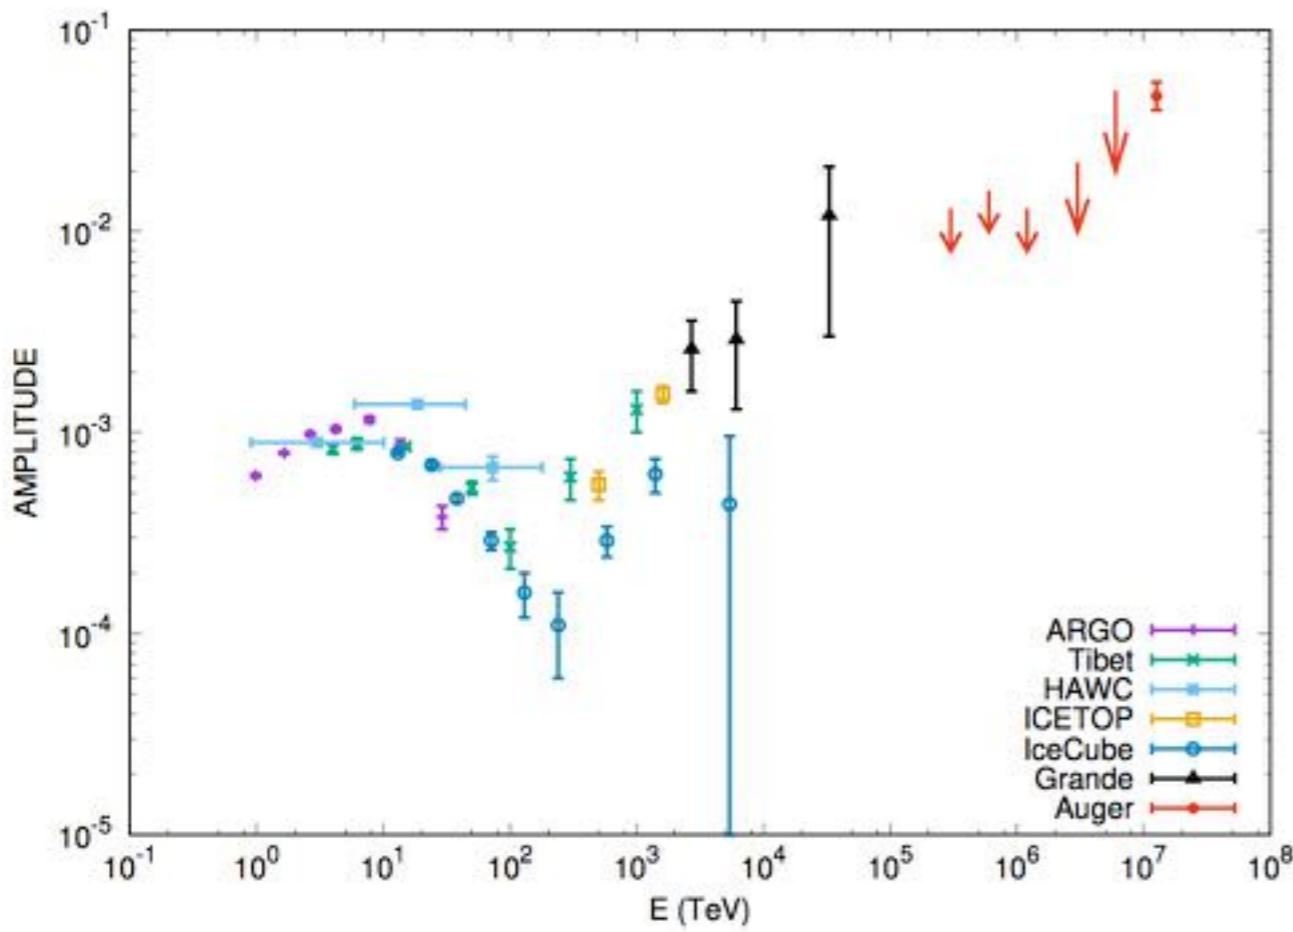

- In anisotropic diffusion model few sources contribute to CR local flux above TeV,
- Local super Bubble effect on CR spectrum is important
 - Flux reduction
 - Reduce anisotropy
 - Production of secondary neutrinos and gamma rays
- Studying the dependance on the properties of the bubble.

Summary

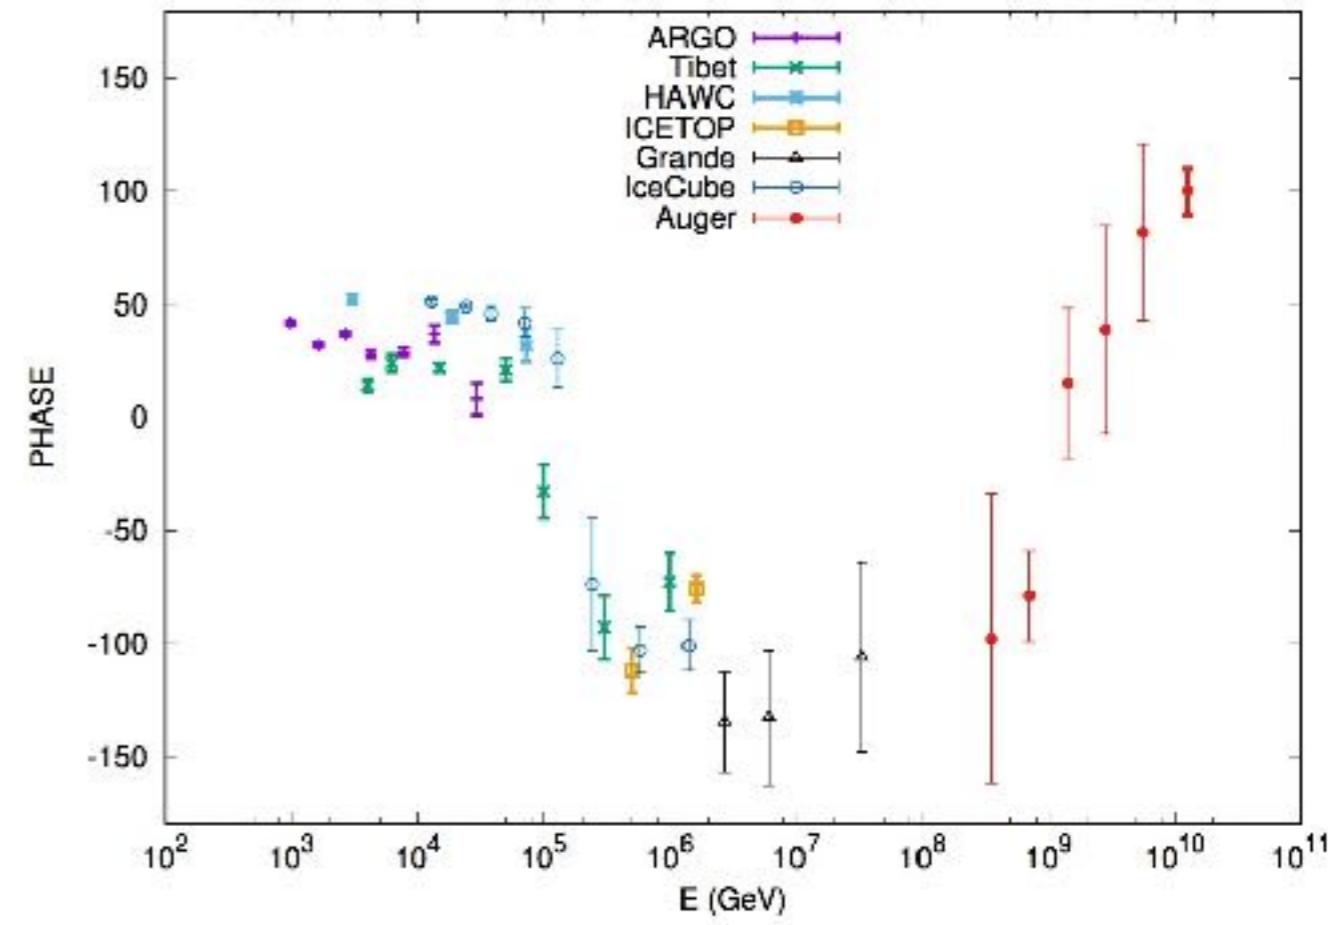

- Excess of gamma ray flux for $E > 1 \text{ TeV}$ outside the galactic plane
- Neutrino flux at $E < 100 \text{ TeV}$ should be galactic
- Multi-messenger signal from a young nearby SNR.
- Neutrino and Gamma ray flux could be explained by the interaction of Vela CR with the Local Bubble.

Thank you for your
attention
