Lepton universality and searches for lepton flavor violation

mercredi 10 mars 2010 08:50 (15 minutes)

We present some recent results obtained by the \babar\ experiment on the search for new physics in leptonic and lepton flavor violating (LFV) decays, exploiting the complete datasets collected at the $\Upsilon(4S)$, $\Upsilon(3S)$ and $\Upsilon(2S)$ energies.

We present new limits on the ratio $\Gamma(\Upsilon(1S) \rightarrow \tau^+ \tau^-)/\Gamma(\Upsilon(1S) \rightarrow \mu^+ \mu^-)$, on LFV decays of the $\Upsilon(3S)$ and $\Upsilon(2S)$, and on τ decays to three charged leptons or $\tau \rightarrow e/\mu\gamma$.
