Recasting Direct Detection Limits Within MicrOMEGAs And Implication For Non-Standard Dark Matter Scenarios

dimanche 29 novembre 2020 22:30 (30 minutes)

Direct detection experiments present 90% exclusion cross-sections for point-like spin-independent Dark Matter interaction with nucleons for fixed cosmological parameters. In this presentation, we discuss a possibility to extend obtained results of such experiments on model with arbitrary cosmological parameters, different form factors of spin-dependent interaction, interactions via light t-channel mediator, millicharged DM.
