European Science Cluster of Astronomy &
Particle physics ESFRI research Infrastructures

CASA

JIVE

E-OSSR Onboarding Presentation

27 November 2020

ESCAPE - The European Science Cluster of Astronomy & Particle Physics ESFRI Research Infrastructures has received fundings from the European Union's Horizon 2020 research and innovation programme under the Grant Agreement n° 824064.

- Joint Institute for VLBI ERIC
 - Support the European VLBI Network (EVN)
 - To do very high resolution radio astronomy (mas)

Image by Paul Boven (boven@jive.eu). Satellite image: Blue Marble Next Generation, courtesy of Nasa Visible Earth (visibleearth.nasa.gov).

- Common Astronomy Software Applications
 - Based on casacore libraries
 - Official package for ALMA and VLA
 - Used by other telescopes (MeerKAT, ATCA)
- VLBI
 - Replacing current AIPS-based data reduction
 - AIPS: old non-standard FORTRAN code no longer supported by NRAO
 - Calibration and imaging of visibility data
 - Used by scientist and (future) QA pipeline
 - Provide pipeline notebooks as starting point

CASA Python transition

- Currently two main CASA versions
 - CASA 5: monolithic, Python 2 based
 - CASA 6: modular, Python 3 based
 - Also available as PIP wheels
- MeasurementSet data model
 - Used by most modern radio instruments (LOFAR, ASKAP)
- CASA tables data format
- Future development: CNGI
 - Based on dask/xarray
 - <https://cngi-prototype.readthedocs.io/>

CASA development

- Developed by an international consortium lead by NRAO
- Development driven by stakeholder requirements
- C++ and Python
- Developed using Atlassian suite (JIRA, Bitbucket, Bamboo)
 - Development on git branches associated with JIRA tickets
- Online documentation in Plone
 - Documentation of new features strictly enforced
- Extensive test-suite that uses CI (Bamboo)
 - Delivers packages used for **verification** and **validation**
- Semantic versioning
 - Typically two releases per year + “pipeline” releases
- Software primarily operates on Measurement Sets
- Licensed under LGPL-3.0 and GPL-3.0

CASA Requirements

- Supported on Mac OS X and Linux (RHEL)
 - Typically supports last two OS X releases
 - RHEL package runs on most Linux distros
 - Linux package delivered as tar file that includes deps
- Medium configuration: 8 core CPU, 128GB memory, 24 TB of storage
- JIVE provides containerized CASA Jupyter kernel
 - Build from source on Ubuntu
- Container includes some additional tools: AOFlagger, WSclean, jplotter
 - All Operate on Measurement Sets

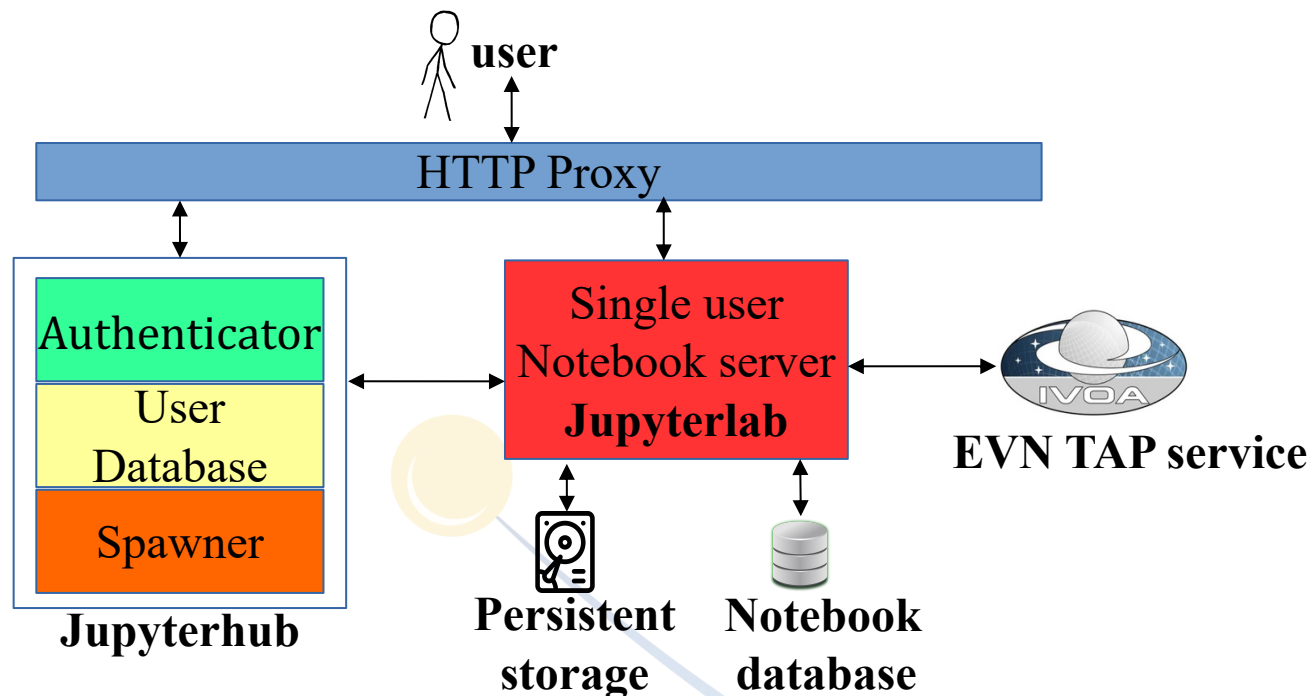

- Onboarding
 - Jupyter kernel source code
 - DOCKER and Singularity containers
- Source code and Jupyter kernel documentation
 - <https://github.com/aardk/jupyter-casa>
 - <https://gitlab.in2p3.fr/keimpema/jupyter-casa>
- Tutorials: <https://casaguides.nrao.edu>
- Data discovery
 - Virtual Observatory (VO) mostly centred on providing images, not raw data
 - VO TAP service for EVN Archive is under development (WP4)

Use Case: EVN Archive

- Provide access to EVN Archive through Jupyterhub
- Users can pipeline any experiment and results are stored in persistent storage
- Will be made available in the ESAP

EVN JupyterHub demo
