- Conclusions

Introduction

Who am I

- Physics student, master in physics of the matter at the university of Milano-Bicocca, Italy
- CERN based, currently doing my 2nd year (but D3) of PhD
- My interests involved mainly python, pizza and hydroponics systems

My PhD

Goal: find, study, develop strategies to reduce greenhouse gases (GHGs) emissions from gas systems at CERN LHC experiments.

Main PhD activities

Gas Systems for LHC-experiments

- Upgrades, maintenance and operation of LHC-experiments
- Gas control systems software involvement

R&D on gas systems

- RPC performance studies with eco-friendly gas mixtures
- Live monitoring tools for dedicated setups
- Data analysis on GHG emission for specific systems

Greenhouse gases

Greenhouse gases

A **Greenhouse gas** (GHG) is a gas absorbing and emitting energy in the **infrared range**, causing the greenhouse effect (i.e. warming the earth surface)

Fluorinated gases are usually **high-GWP** gases, thus considered **GHGs**

The **global warming potential** (GWP) is a measure to quantify the “strength” of a GHG.

it measures how much energy the emissions of 1 ton of a gas will absorb over a given period of time, relative to the emissions of 1 ton of CO₂.

Gas	GWP[100]	Lifetime [years]
CO ₂	1	*
CH ₄	28	12.4
N ₂ O	265	121
C ₂ H ₂ F ₄	1430	14
CF ₄	7390	50000
SF ₆	22800	3200

Greenhouse gases at CERN

At **CERN**, several gaseous detectors use **gas mixtures** with at least one **GHG**.

The main **GHG emissions** from particle detectors are due to **fluorinated** compounds.

The main emission is coming from **C2H2F4** (R-134a), used in ATLAS, CMS and ALICE experiments

European union **F- regulation** aims at reduce the F-gas availability

PhD goal: find, study, develop strategies to reduce GHGs emission from particle detectors at CERN LHC experiments

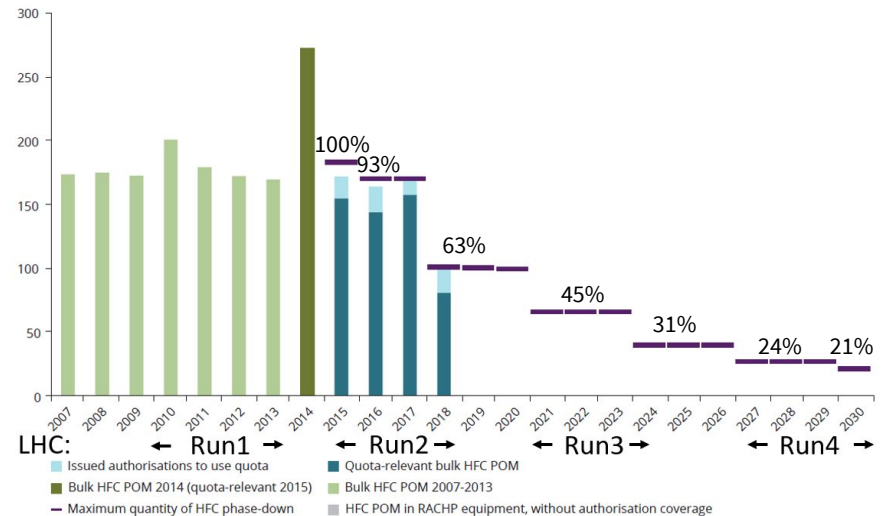

Figure ES.1 Progress of the EU HFC phase-down

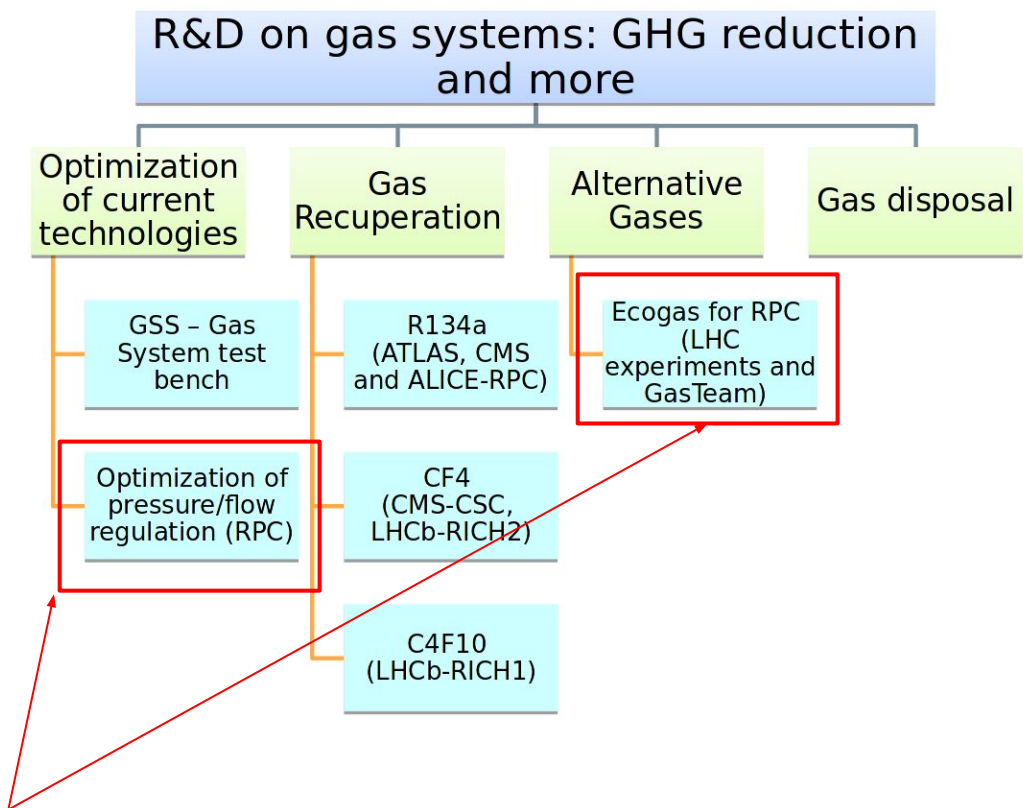

Placing on the market of HFCs (Mt CO₂e)

Strategies to reduce GHG emissions

Four different strategies defined:

- **Optimization** of current technologies: gas recirculation, pressures and flow fine regulation
- **Gas recuperation**: extract GHGs from gas mixtures and reuse them
- **Alternative gases**: study the effects of eco-friendly gas on detectors performance
- **Gas disposal**: abatement of the gas if possible

Main PhD activities

Optimization of current technologies

Optimization of current technologies

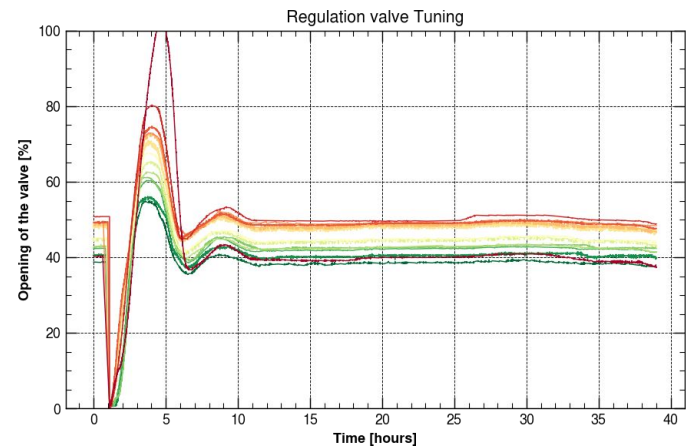

Hardware optimization

- Optimization of **single modules**:
 - Drawings, CADs collection
 - Piping, layout organization
- Proper checks and maintenance on **existing equipment**
 - Ex: pump membranes and mass flow controllers check
- Installation of **new components** in the gas systems
 - E.g. regulation valves for pressure control
 - E.g. filters for dust, micro particles

Software optimization

- Parameters tuning:
 - **P.I.D.** values of regulation valves
 - Flow and pressure setpoints
- Alarms and notifications to the operator:
 - Thresholds
 - Severity levels
 - Timers, hysteresis and so on
- Archiving and data retrieval
 - Optimize the number of stored data point
 - Improve offline and online data retrieval tools

Gas Control and monitoring Systems

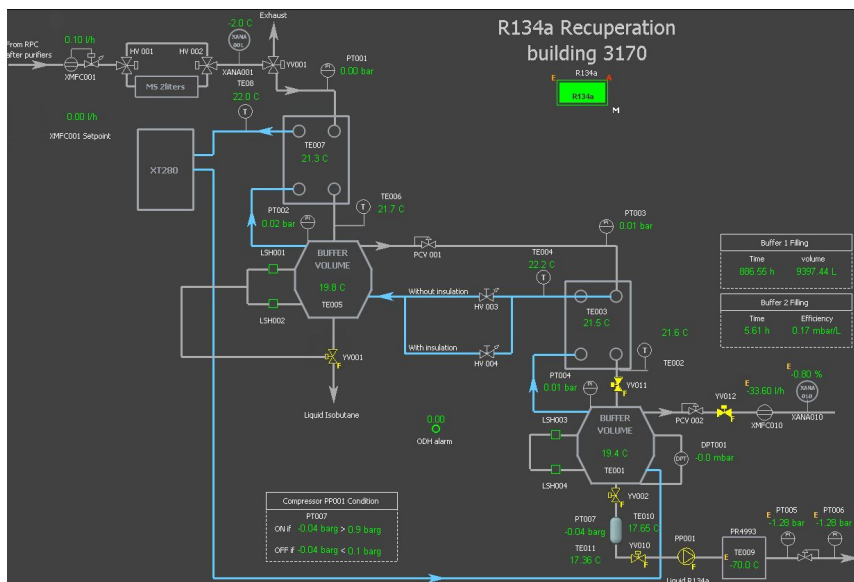

Gas control systems (GCS) allow to monitor and control the plant providing gas to detectors.

Main features:

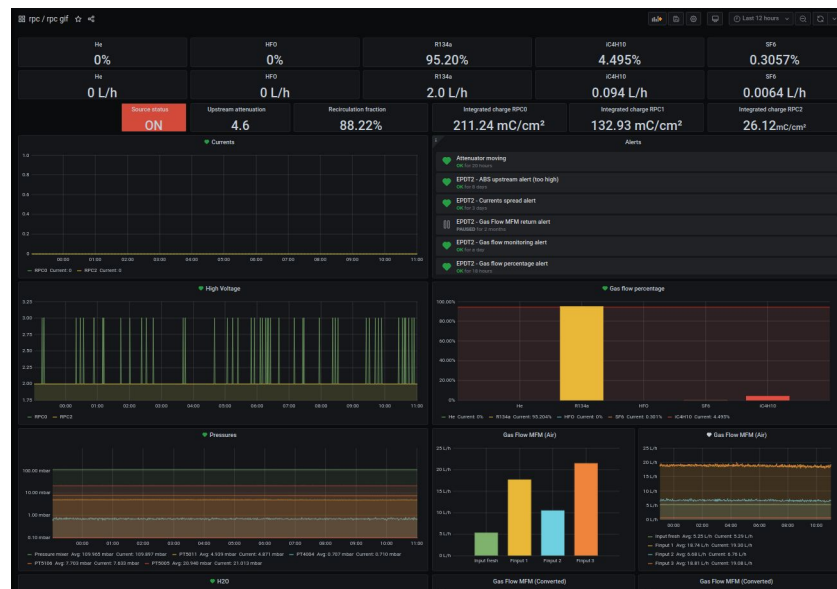

- Built on by CERN industrial control + Siemens SCADA software
- Common Human Machine Interface for operators -> Ease of use

Monitoring systems: technologies involved

- SCADA: WinCC-OA
- PLC programming: Schneider electric
- Web
 - Devops: Openshift
 - Time series databases: InfluxDB
 - Dashboarding: Grafana
- Analysis: python with its ecosystem

WinCC-OA: monitor and control

Grafana: monitor

Alternative gases and Resistive Plate Chambers detectors

Alternative gases

Detector **performance** characterization with of **eco-friendly** gas mixtures.

Few detectors are studied: mainly **Resistive Plate Chambers** (RPCs) because of their emissions and **Gas Electron Multipliers** (GEM).

Pros

- Reduction in GHGs emissions
- **Gas system complexity remains the same**
- Possibility to operate detectors at **higher flow rates** if needed

Studies of RPC operations with ecological gas mixture under irradiation at GIF++

Université Claude Bernard Lyon I (FR)

RPC and eco-friendly gas mixtures

Resistive Plate Chambers at the LHC:

- Used in ATLAS, CMS and ALICE experiments
- Gas mixture based on ~95% of C₂H₂F₄

- C₂H₂F₄ has a high **Global Warming Potential** (GWP₁₀ years = 1430)
- European regulation aims at **reducing the use of C₂H₂F₄**

C₃H₂F₄/HFO1234-ze

- HFO-1234ze is a **suitable alternative** of C₂H₂F₄ in refrigerants industry
- Tests were started on using HFO based gas mixture for **RPC detectors**

Goal: to characterize the HFO-based gas mixtures

Experimental setup

- 5 **HPL chambers** under test: ATLAS, ALICE, CMS-GT, CMS-KODEL, CERN-EPDT

- 4 component **gas mixer + humidifier** module
- CAEN SY527 **HV mainframe** with two A1526 boards
- WEB-DCS **software** designed by CMS group
- Grafana web-app for **monitoring**

Chamber name	Gap (mm)	Type
CMS-GT-0-0	2	Double gap
CMS-KODEL-0-0	14	Double gap
ATLAS-0-0	2	Single gap
ALICE-0-0	2	Single gap
EPDT-0-0	2	Single gap

CERN Gamma Irradiation Facility (GIF++)

- Situated on **H4 SPS beam line**
- A 14 TBq source of ¹³⁷Cs simulates the background radiation expected at **High Luminosity LHC**
- System of filters (ABS) allows to regulate the **gamma background rate**

Cons

- **Long term studies** are required to validate detectors operation
- Eco-friendly gas price and availability
- **Performance gains/loss still not clear**

Resistive Plate Chambers (RPCs) at LHC

RPCs: gaseous particle detectors employed in **ATLAS**, **CMS** and **ALICE** experiments

The gas mixtures is made out of 2 or 3 main components: $C_2H_2F_4$ (**R-134a**), $i-C_4H_{10}$ and SF_6 with a gas mixture of $GWP_{[100]} \sim 1400$

The **presence of leaks** at detector level in ATLAS and CMS results in a considerable **GHG emissions** due to **R-134a**.

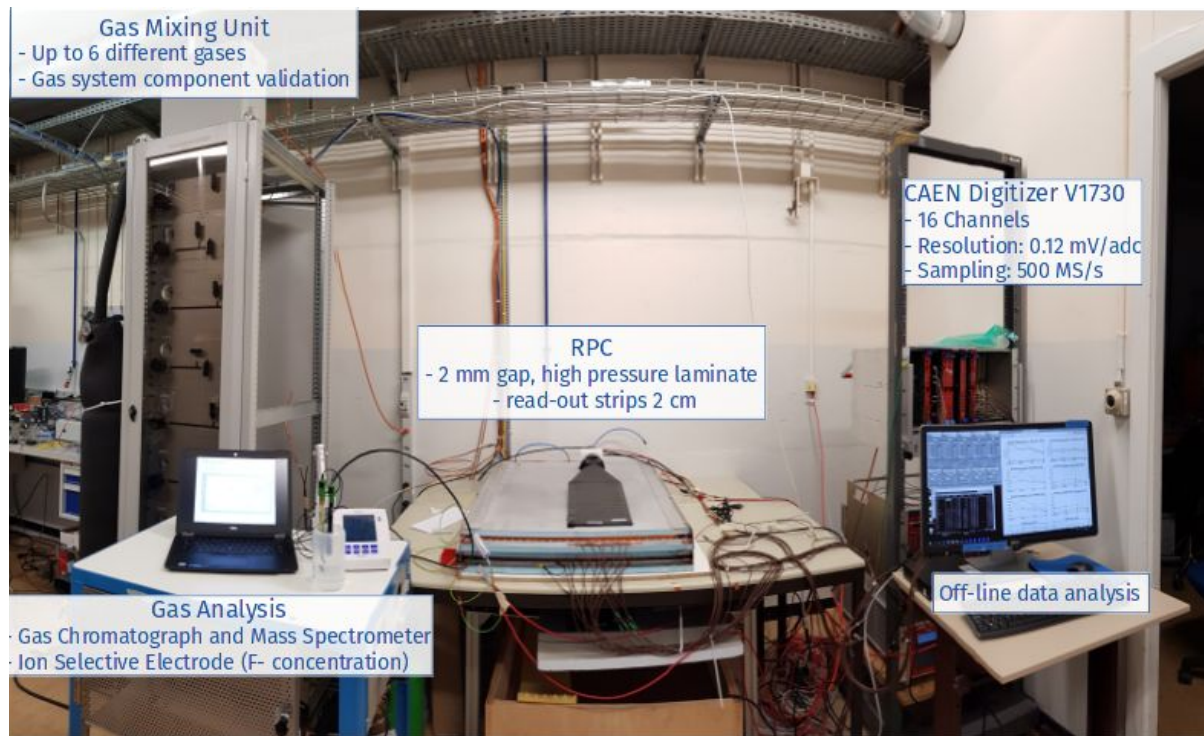

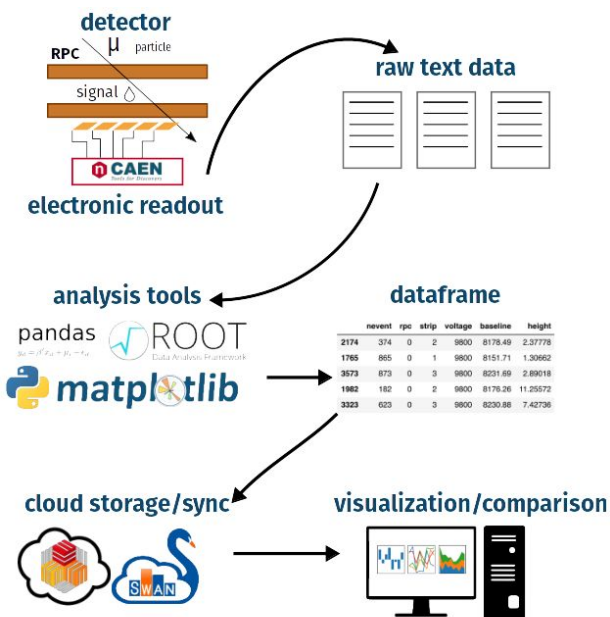

The refrigerant industry started using Hydro-Fluoro-Olefins (**HFOs**) gases as **R-134a alternative**.

Goal: find and **eco-friendly** gas mixture **compatible** with the current ATLAS and CMS RPC systems (i.e. requires no change in the HV cables, FE electronics, gas system etc.)

Eco-friendly gases performance studies

RPCs performance studied with eco-friendly gas mixtures and cosmics muons on a dedicated setup

Dedicated **data acquisition system** and **Data analysis pipeline** written for studying the detectors

Alternatives to R-134a: HFO-1234ze

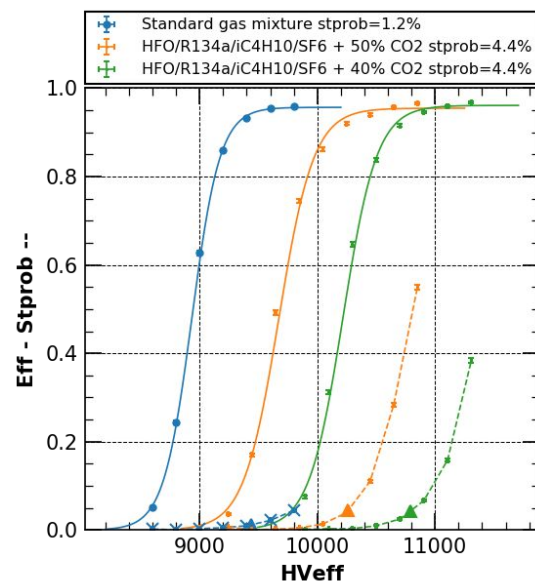

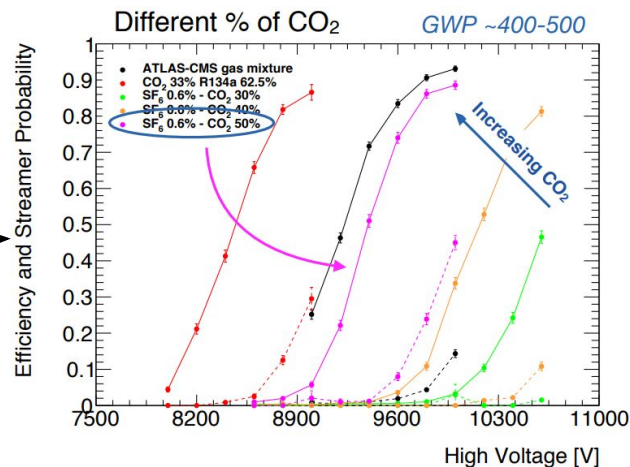

The **working point** of the detector with HFO replaced to R-134a is > 12 kV, **not suitable for LHC**

An addition of a gas lowering the working point is required: **4-components gas mixtures** with CO_2 were studied

A small fraction of **R-134a** is needed to mitigate streamer fractions and stabilize the detector performance -> **5-component gas mixtures**

2 selected **HFO-based** gas mixtures:

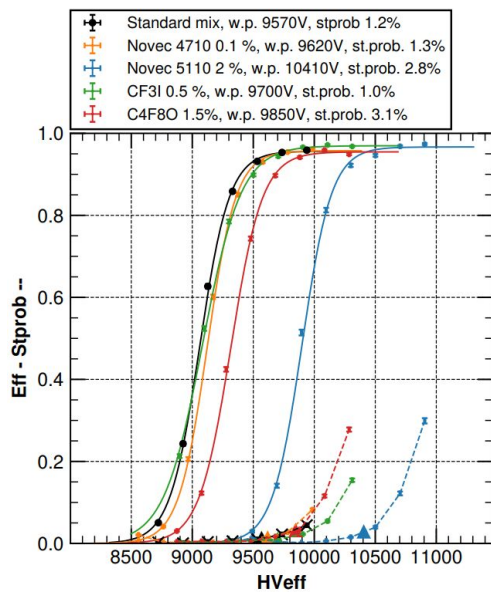

Gas mixture	Working point [V]	St. Prob. [%]	Pulse charge av [pC]	Pulse charge st [pC]	Cluster size [# /2cm]	Time resolution [ns]
Standard	9440	1.2	0.8	10.1	2	1.9
HFO/ R134a/ iC4H10/SF6 + 50% CO2	10260	4.4	1.1	14.7	2.3	2
HFO/ R134a/ iC4H10/SF6 + 40% CO2	10790	4.4	1.1	11.8	2.2	1.8

Alternatives to SF6

Alternatives to SF₆ were tested and they are still under study:

- CF₃I: GWP = 0, **good** performance but **toxic**
- Novec 5110: GWP < 1, discrete performance but **boiling point** at 26 °C
- Novec 4710: GWP 4700, **excellent performance** but may react with **water**
- C₄F₈O: GWP ~ 8000, poor performance

- Rain Out → Water Solubility
very low water solubility (1 ppmw)
- Oxidation → Reactivity with •OH
unreactive w/ •OH radicals

Photolysis → UV Absorbance
strong absorbance in near UV (wavelengths ≥ 300 nm)

- Rain Out → Water Solubility
very low water solubility (272 ppbw)

Oxidation → Reactivity with •OH
reactive w/ •OH radicals

Photolysis → UV Absorbance
transparent in near UV

John G. Owens, 3M, Greenhouse Gas Emission Reductions from Electric Power Equipment through Use of Sustainable Alternatives to SF₆

Gamma Irradiation Facility

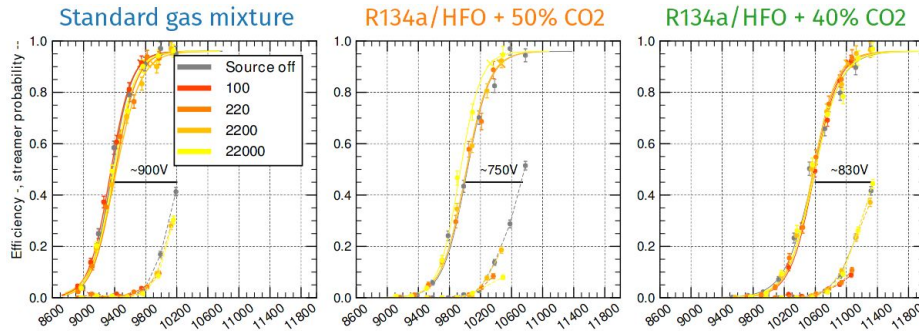

Long term study of RPCs performance with eco-friendly gas mixture started.

Goal: characterize performance with

- eco-friendly gas mixtures
- LHC-like conditions:
 - Background radiation
 - Gas recirculation

RPCs studied with both muon beam and gamma irradiation during test beam

ABS	Gamma Rate [kHz/cm ²]
100	55.3
220	41.2
2200	3.75
22000	0.774

<https://doi.org/10.1088/1748-0221/15/05/c05004>

Impurities study

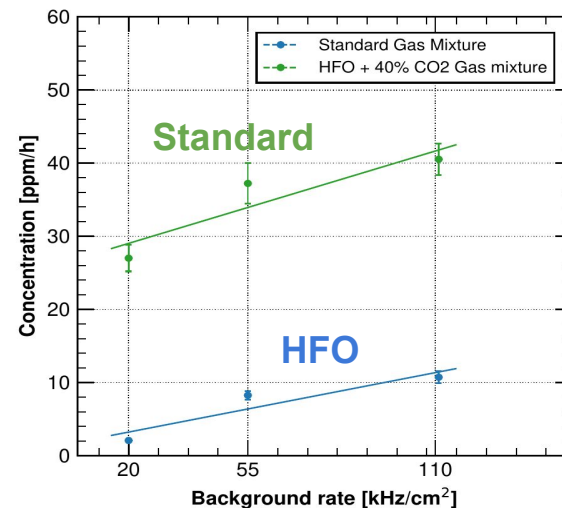

Under the effect of high background radiation and electric fields **Freons** (HFO, R-134a) **molecules break** into **fluorine radicals**.

F- radicals may react with water vapour contained in the RPC gas mixtures and could form **fluoridric acid (HF)**

HF could damage surface of the electrodes of the detectors

A dedicated test was conducted to measure the **rate of HF production** by irradiating 2 RPC and measuring the HF with Ion Selective Electrodes (ISE) stations.

We found out that HFO molecules are breaking ~10 times more easily than R-134a molecules

<https://doi.org/10.1088/1748-0221/15/11/C11003>

Conclusions

Several strategies for GHG emissions reductions

Different activities involvement

LHC Gas Systems upgrades:

- Mechanical and software upgrades, **maintenance**, operation and **optimization** of gas systems
- **Several LHC gas systems** to operate on (~ 30 systems)

R&D on Gas Systems

- Lot of RPC detectors and **gas mixtures** to test
- **Long term studies** progressing
- **Several challenges** posed by new gases under test

Thank you!

Backup

Optimization of current technologies

Hardware optimization

- Fine tuning of flow and pressure on the detectors and in the gas system
- Proper checks and maintenance on existing equipment
- Installation of new components in the gas systems

Software optimization

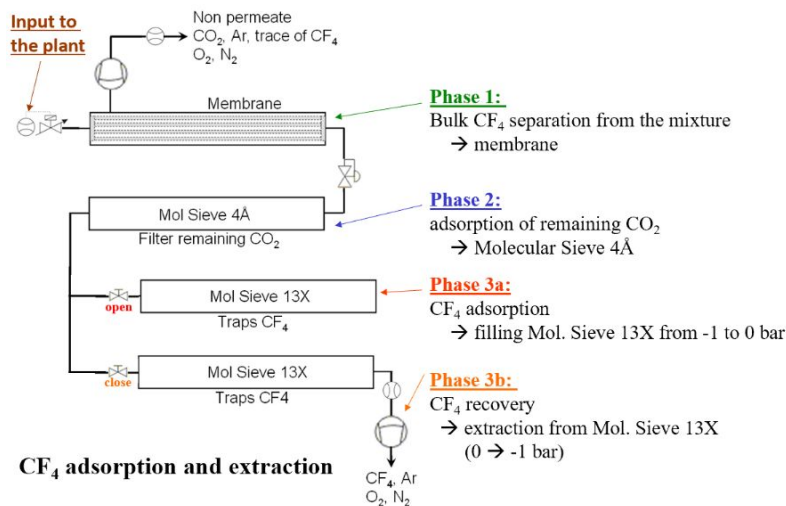

-

Gas recuperation systems

Several detectors using **expensive** or **GHGs** in their gas mixture: RPCs, ALICE-TRD, ATLAS-TRT, CMS-CSC, LHCb-RICH1, etc.

Gas components can be **extracted** from the gas mixture and **stored** in the bottles

CMS-CSC CF₄ recuperation

Pros:

- Cost reduction, GHGs reduction
- **Reduce impurities** that can't be purified by recirculation systems (mostly N₂)
- Allows to operate the gas system with a high "fresh" flow

Cons:

- **Increase in system complexity**
- It works only under particular conditions (pressure, flow, etc.)
- Different recovery techniques are required for different gas and gas mixtures (membrane separation, pressure swing, cryogenic distillation, etc.)
