## Replication crisis

From Wikipedia, the free encyclopedia

The **replication crisis** (or **replicability crisis** or **reproducibility crisis**) is, as of 2020, an ongoing [methodological](#) crisis in which it has been found that many scientific studies are difficult or impossible to [replicate](#) or [reproduce](#). The replication crisis affects the [social sciences](#) and [medicine](#) most severely.<sup>[2][3]</sup> The crisis has long-standing roots; the phrase was coined in the early 2010s<sup>[4]</sup> as part of a growing awareness of the problem. The replication crisis represents an important body of research in the field of [metascience](#).<sup>[5]</sup>

Because the reproducibility of experimental results is an essential part of the [scientific method](#),<sup>[6]</sup> the inability to replicate the studies of others has potentially grave consequences for many fields of science in which significant theories are grounded on unreproducible experimental work. The replication crisis has been particularly widely discussed in the field of [psychology](#) and in [medicine](#), where a number of efforts have been made to re-investigate classic results, to determine both the reliability of the results and, if found to be unreliable, the reasons for the failure of replication.<sup>[7][8]</sup>

# Biophysics: bad protein structures

## Geoffrey Chang

From Wikipedia, the free encyclopedia

**Geoffrey Chang** is a professor at the [University of California, San Diego's Skaggs School of Pharmacy and Pharmaceutical Sciences](#) and [Department of Pharmacology, School of Medicine](#). His laboratory focuses on the [structural biology](#) of [integral membrane proteins](#), particularly exploring [X-ray crystallography](#) techniques for solving the [tertiary structures](#) of membrane proteins that are notoriously resistant to [crystallization](#). The laboratory has specialized in structures of [multidrug resistance transporter proteins](#) in [bacteria](#). In 2001, while a faculty member of [The Scripps Research Institute](#), Chang was awarded a [Beckman Young Investigators Award](#),<sup>[1]</sup> designed to support researchers early in their academic careers, for his work on the structural biology of multidrug resistance.<sup>[2]</sup> Chang announced a move from Scripps to neighboring UC San Diego in 2012.<sup>[3]</sup>

In 2007, Chang and coauthors [retracted](#) five previously published papers describing the structures of three multidrug transporter proteins after another research group published a widely differing structure, which led to the discovery of a critical [bug](#) in the Chang group's custom software tools.<sup>[4]</sup> Since that time, however, Chang has published other papers in the field of structural biology,<sup>[5][6]</sup> and has been awarded a EUREKA grant, "for exceptionally innovative research projects that could have an extraordinarily significant impact on many areas of science," from the National Institutes of Health.<sup>[7]</sup>

---

## COMMENTARY

### Five retracted structure reports: Inverted or incorrect?

[B.W. Matthews, Protein Science, 2007](#)

# Chemical physics: how many phases for supercooled water?

A.G. Smart, Physics Today, 2018

# The trinity of reproducibility

## **Experimental reproducibility:**

Re-do an experiment and get sufficiently close results.

## **Statistical reproducibility:**

Re-do a study with a different sample and get sufficiently close results.

## **Computational reproducibility:**

Re-do a computation (data analysis, simulation, ...) and get identical results.

# Causes of the reproducibility crisis

**Experimental reproducibility:** well understood

Re-do an experiment and get sufficiently close results.

**Statistical reproducibility:** incomplete understanding of statistical methods

Re-do a study with a different sample and get sufficiently close results.

**Computational reproducibility:** lack of rigor in documenting computations

Re-do a computation (data analysis, simulation, ...) and get identical results.

# Reproducibility vs. replicability

## Reproducibility

- Technical
- Done right?
- Straightforward.
- Simple answer: yes/no
- **Verification**

## Replicability

- Scientific
- The right thing to do?
- Difficult to judge.
- Complex answer: if... maybe...
- **Validation**

## In scientific computing:

- Same software
- Same parameters
- Same data
- **Identical result?**

- New software
- Same parameters
- Same data (or not)
- **Equivalent result?**

# Reproducibility vs. replicability

Scientific method: **replicability** / **validation**

**Reproducibility** is a **verification** criterion that accelerates validation

# Why reproducibility matters in scientific computing

- Know for sure what has been computed.
- Ability to verify the computation.
- Safe reuse for other applications.

Particularity of computation: **determinism**

Except for parallel computing, a **deal with the devil**: trade speed against loss of control.

Scientific methods should not be sensitive to technical details.

Such as: compiler versions, operating systems, numerical discretization schemes, ...

**Robustness checks test replicability, not reproducibility.**

## What's the result of this program?

data\_analysis.py

```
from datalib import Dataset

points = [(1, 1), (-1, 1), (2, 4)]

data = Dataset()
for x, y in points:
    if x > 0:
        data.add_value(y)
print(data.average())
```

# Know your libraries *and languages*

`datalib.py`

```
class Dataset(object):  
  
    def __init__(self):  
        self.values = []  
  
    def add_value(self, value):  
        self.values = [value]  
  
    def average(self):  
        return sum(self.values, 0)/len(self.values)
```

Surprise! A bug! `add_value` stores only the last value!

The result of `data_analysis.py` is thus 4. More precisely: 4 in Python 2 but 4.0 in

# Case study: floating-point arithmetic

- Standardized in 1985 by the norm IEEE 754
- Universally accepted today
- Precisely defined deterministic operations
- No direct access to IEEE 754 in high-level programming languages
- Compiler writers decide how formulas are translated into IEEE 754 operations

For reproducibility, consider the compiler an integral part of your program!

# The future of reproducibility

# The future of reproducibility

**Reproducibility will be guaranteed automatically by the computer.**

Technologies for ensuring the integrity of distributed digital information:

- checksums
- content-addressed storage

Already used by:

- Git, Software Heritage
- Nix, Guix
- IPFS / IPLD

Remaining challenges:

- Reconciling interactivity with reproducibility
- Replicability
- Verifiability
