

21th AGATA Week, 3th March 2021

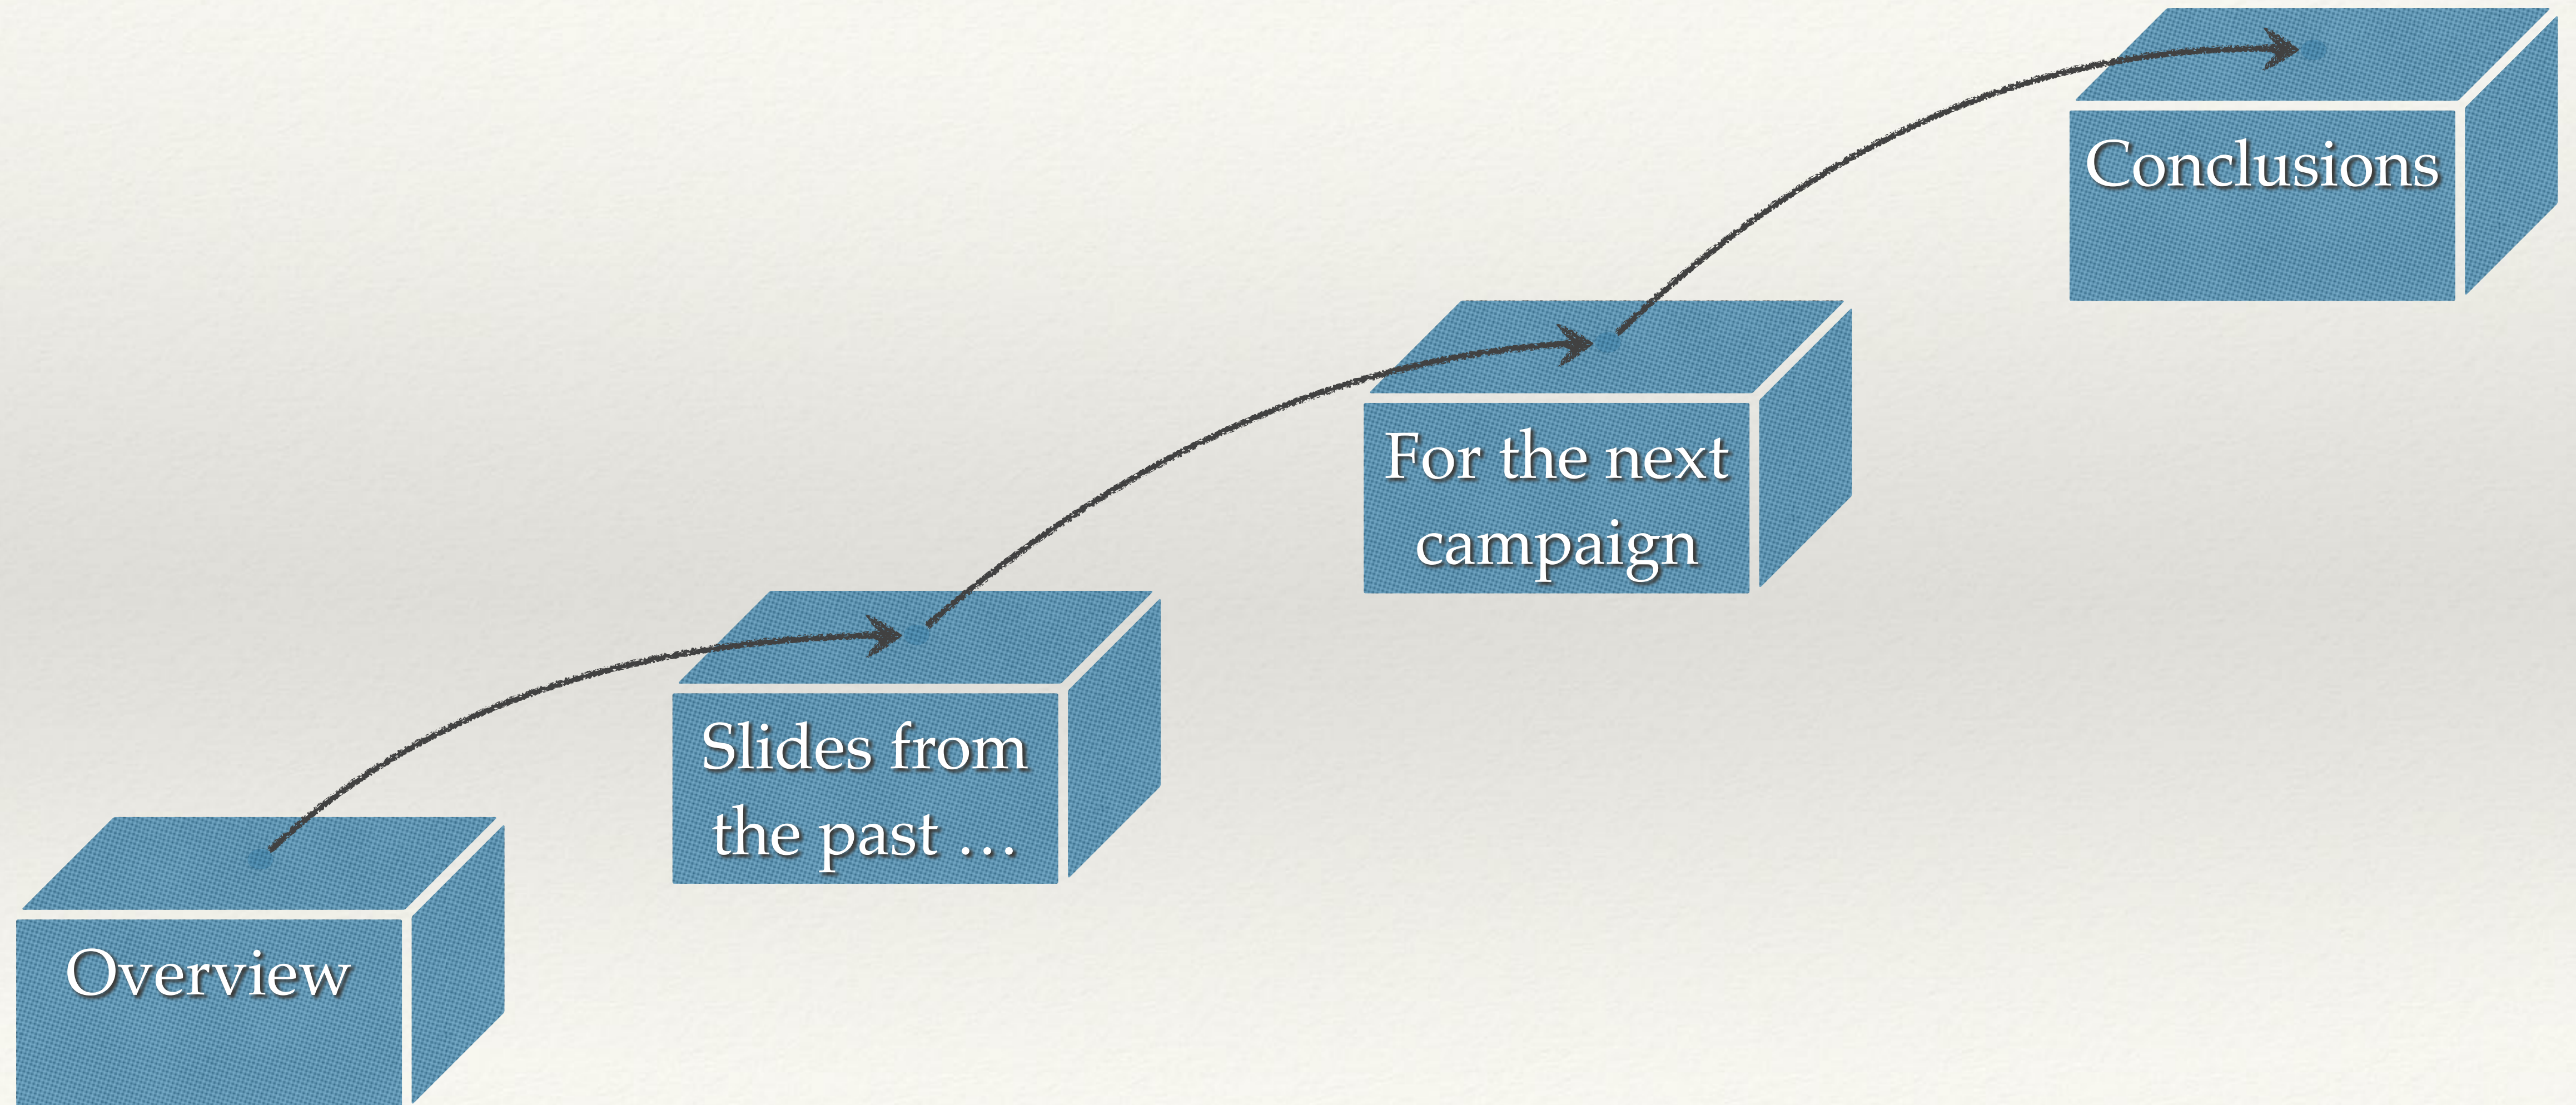

Data Analysis of future experiments with AGATA & PRISMA

O. Stézowski

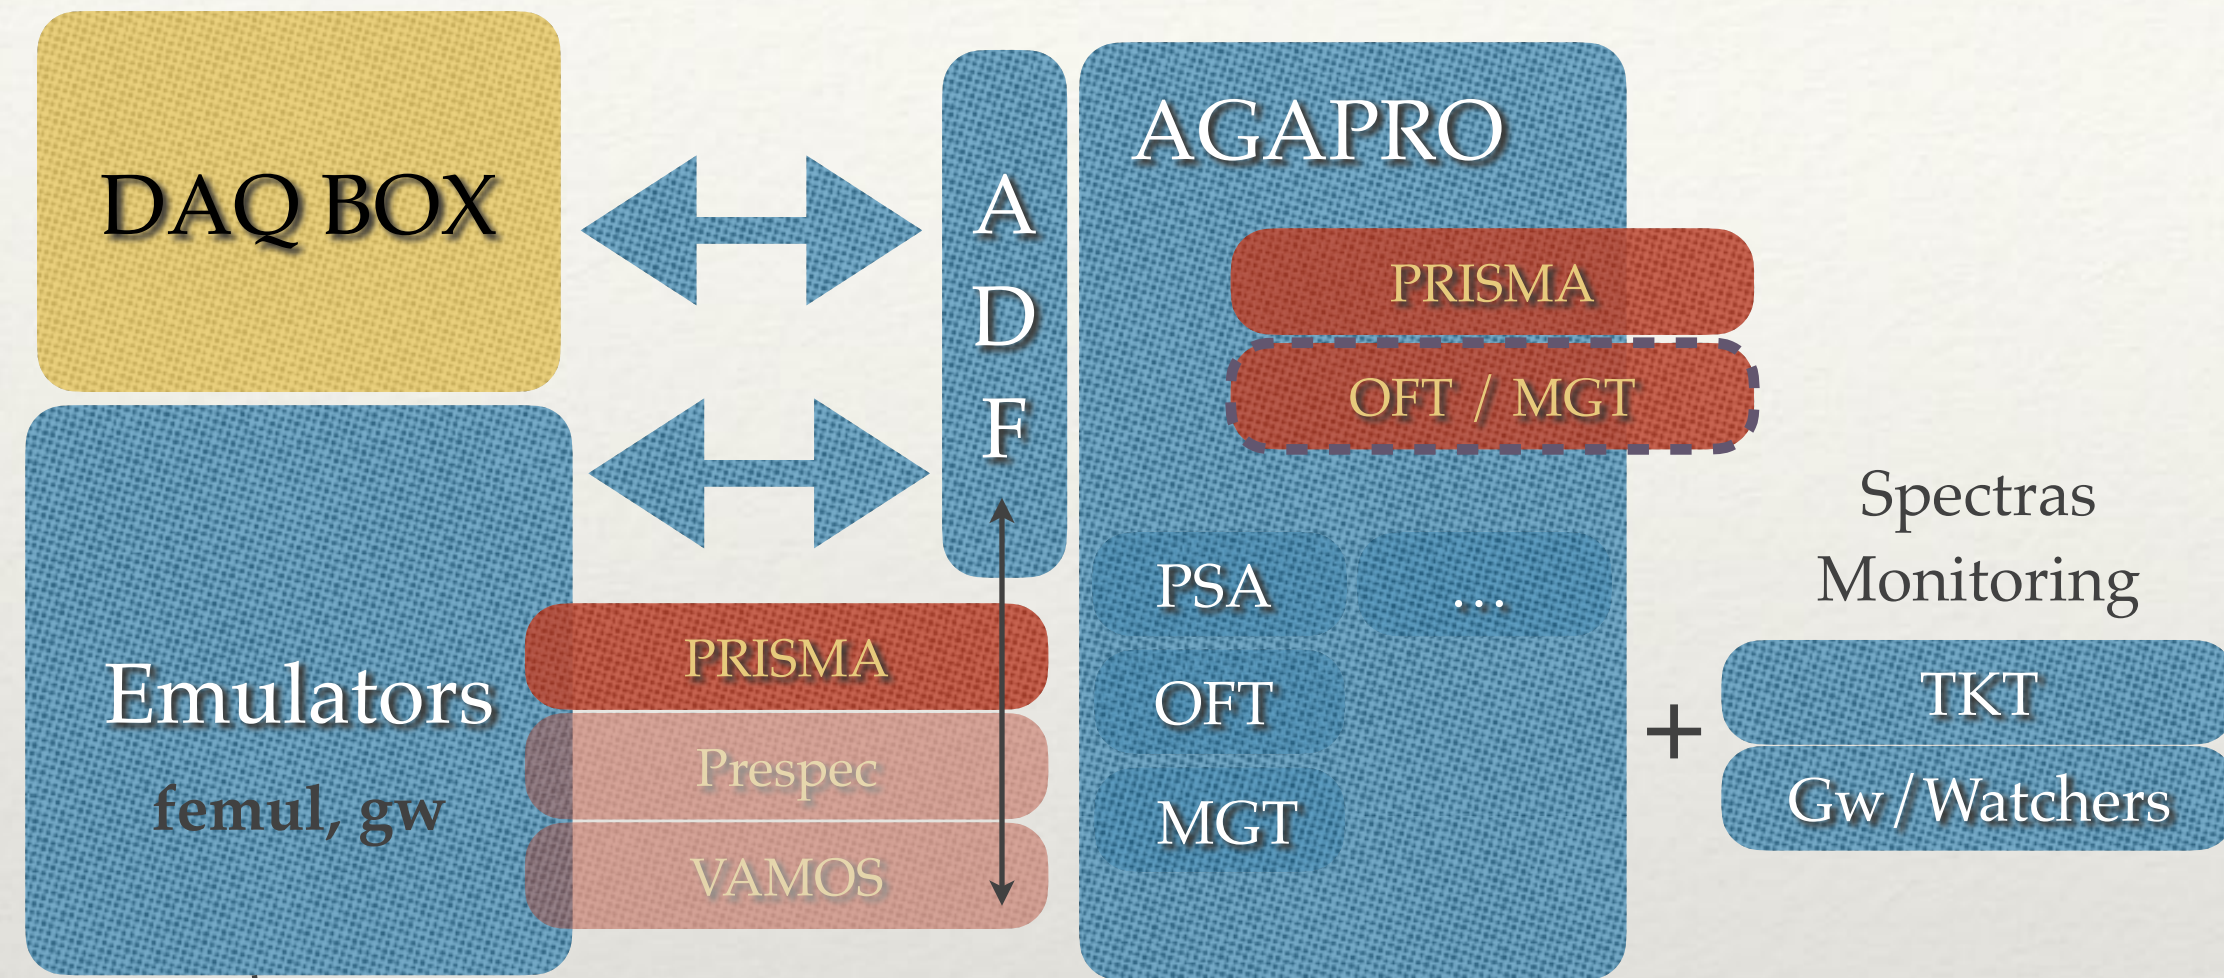

➔ From Legnaro around 2010 back to Legnaro about ten years later !

Outline

Overview : from right side back to left side ...

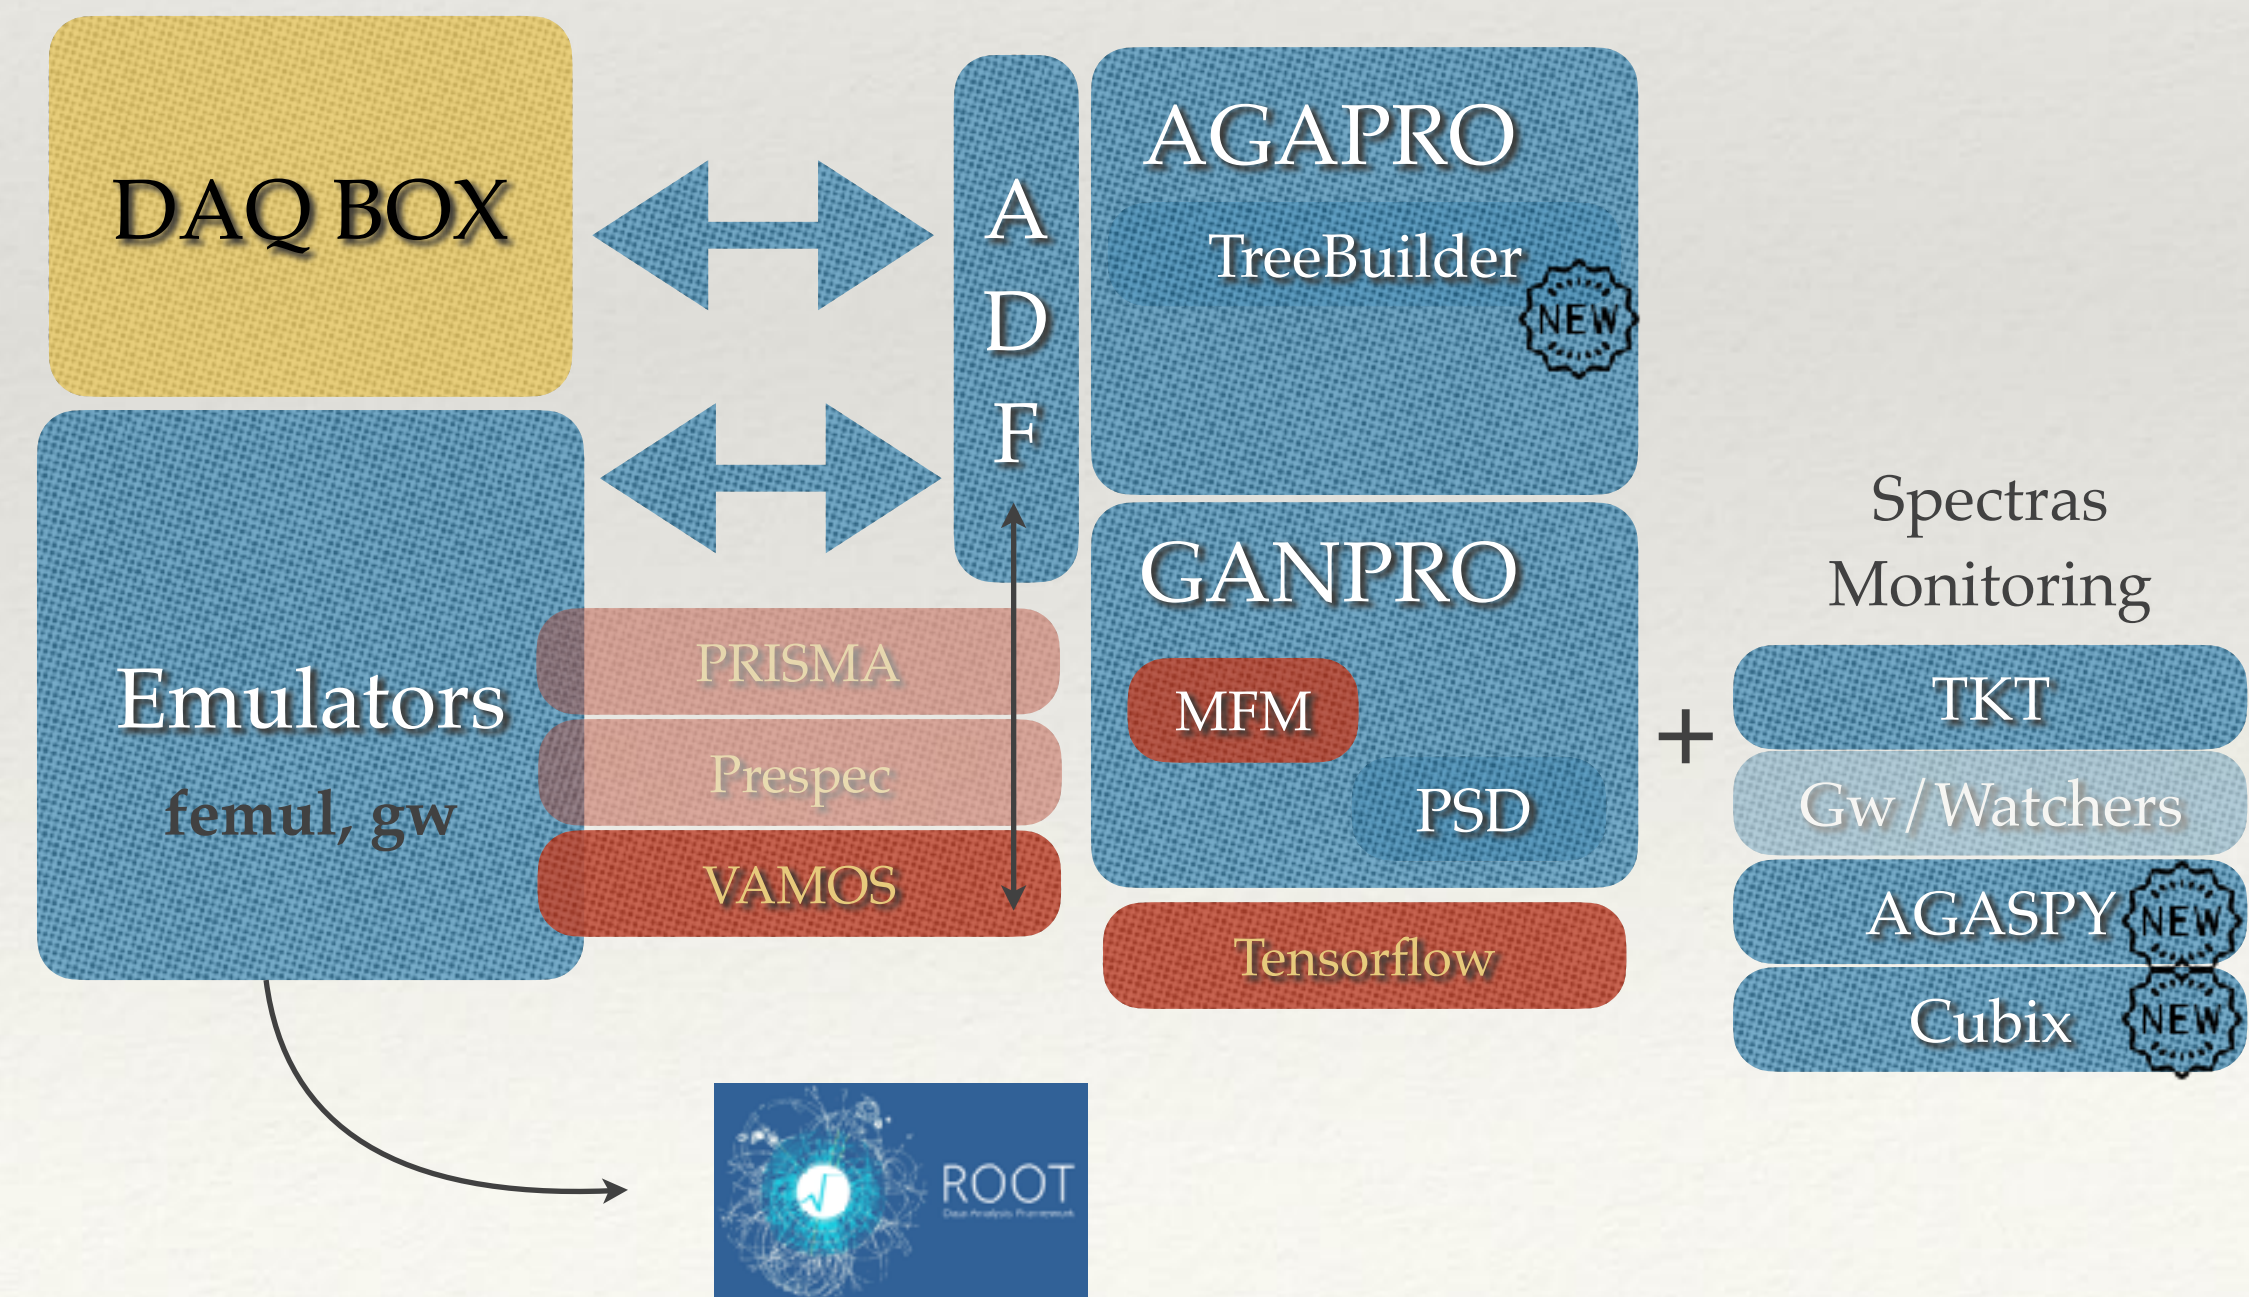

Root Trees

Situation @ LNL ~ 2010

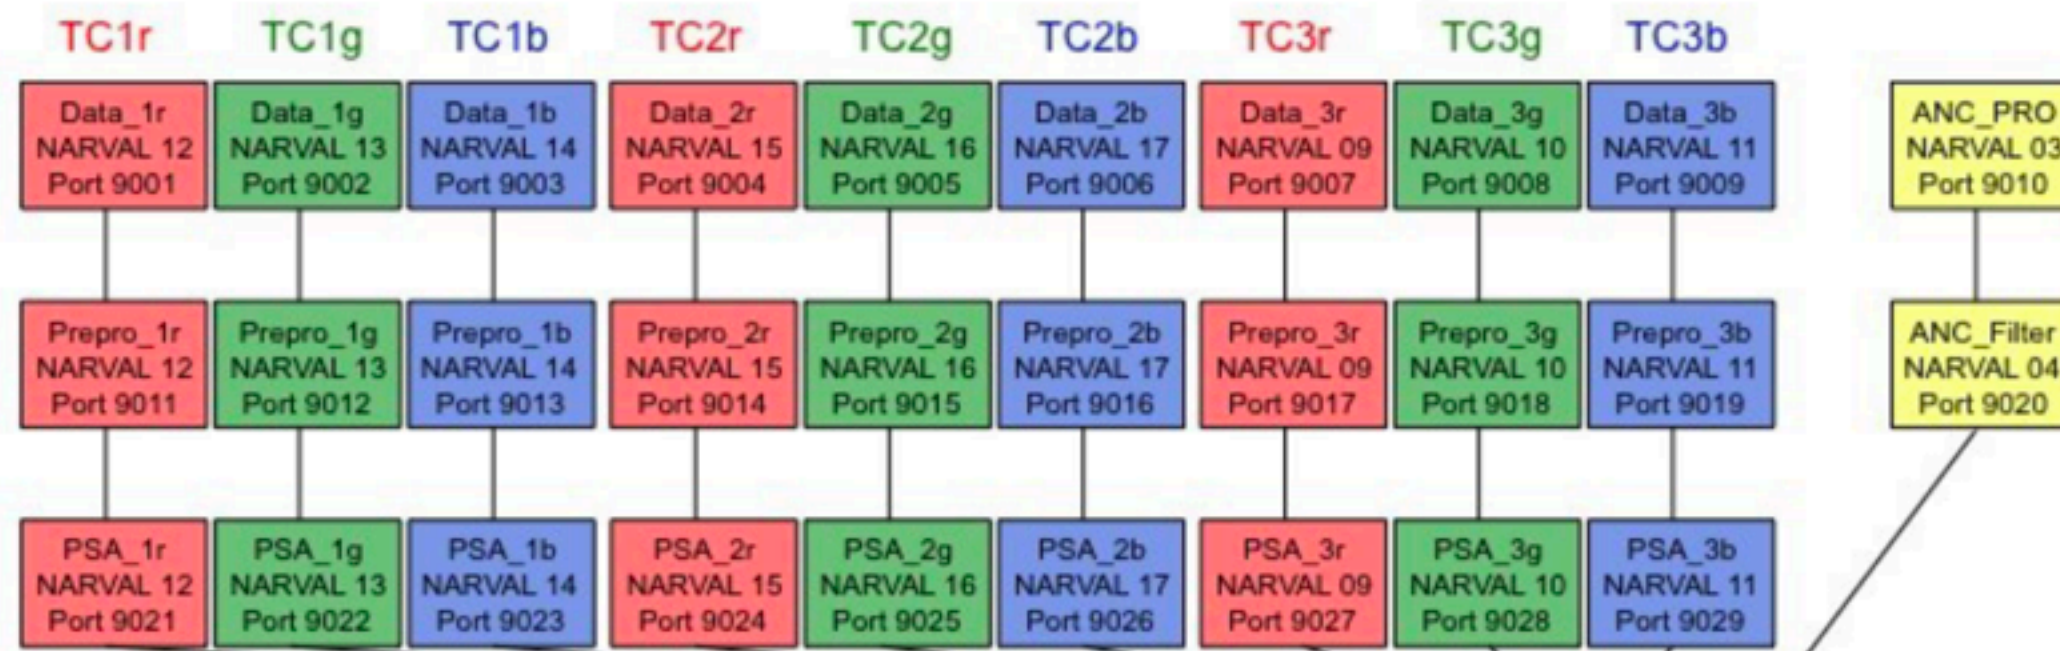

Current situation @ GANIL

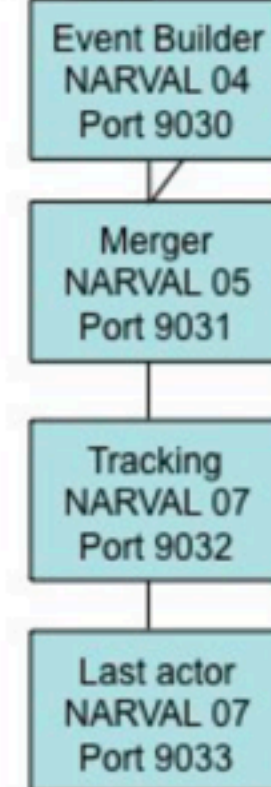

Slides from the past ...

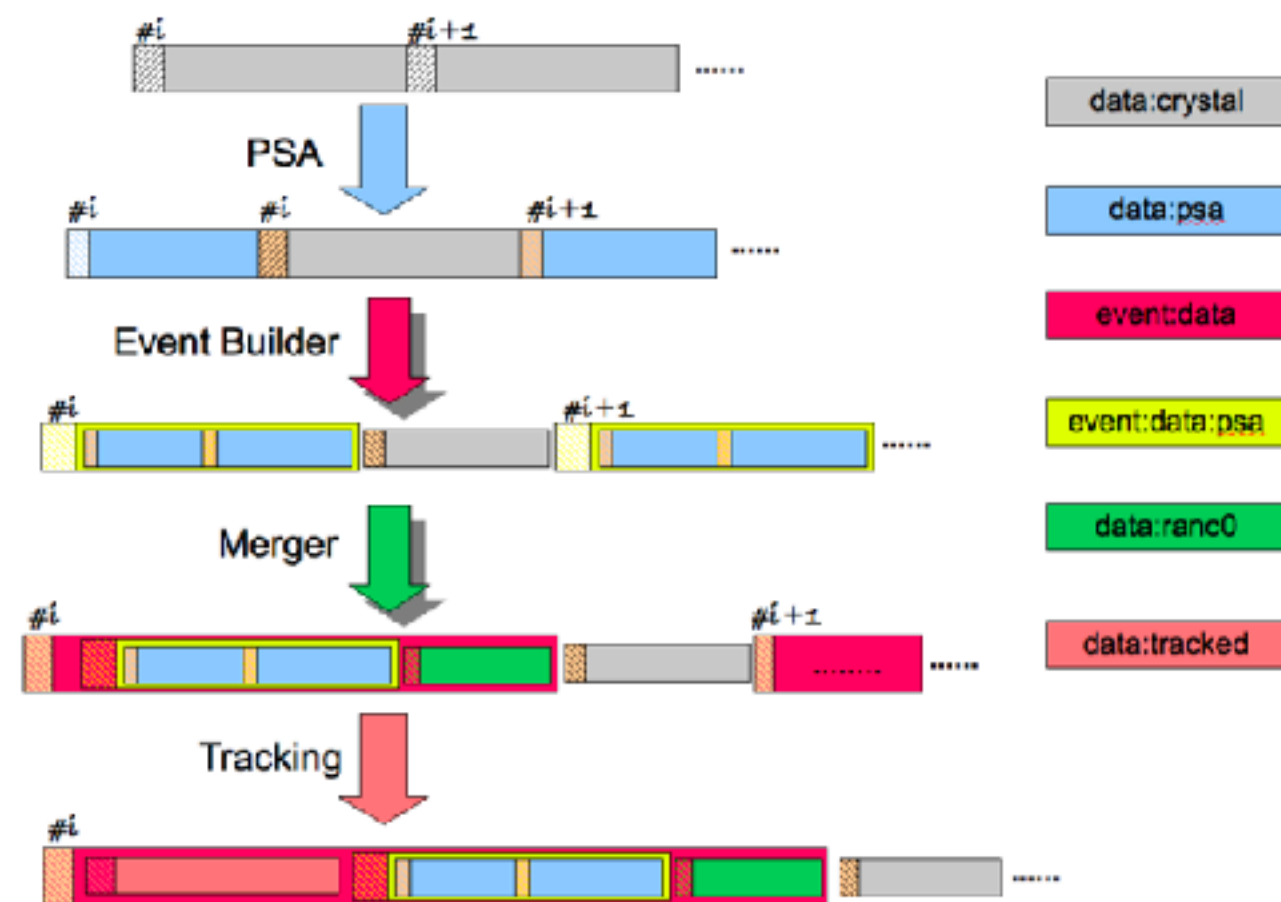

Local Level

Global Level

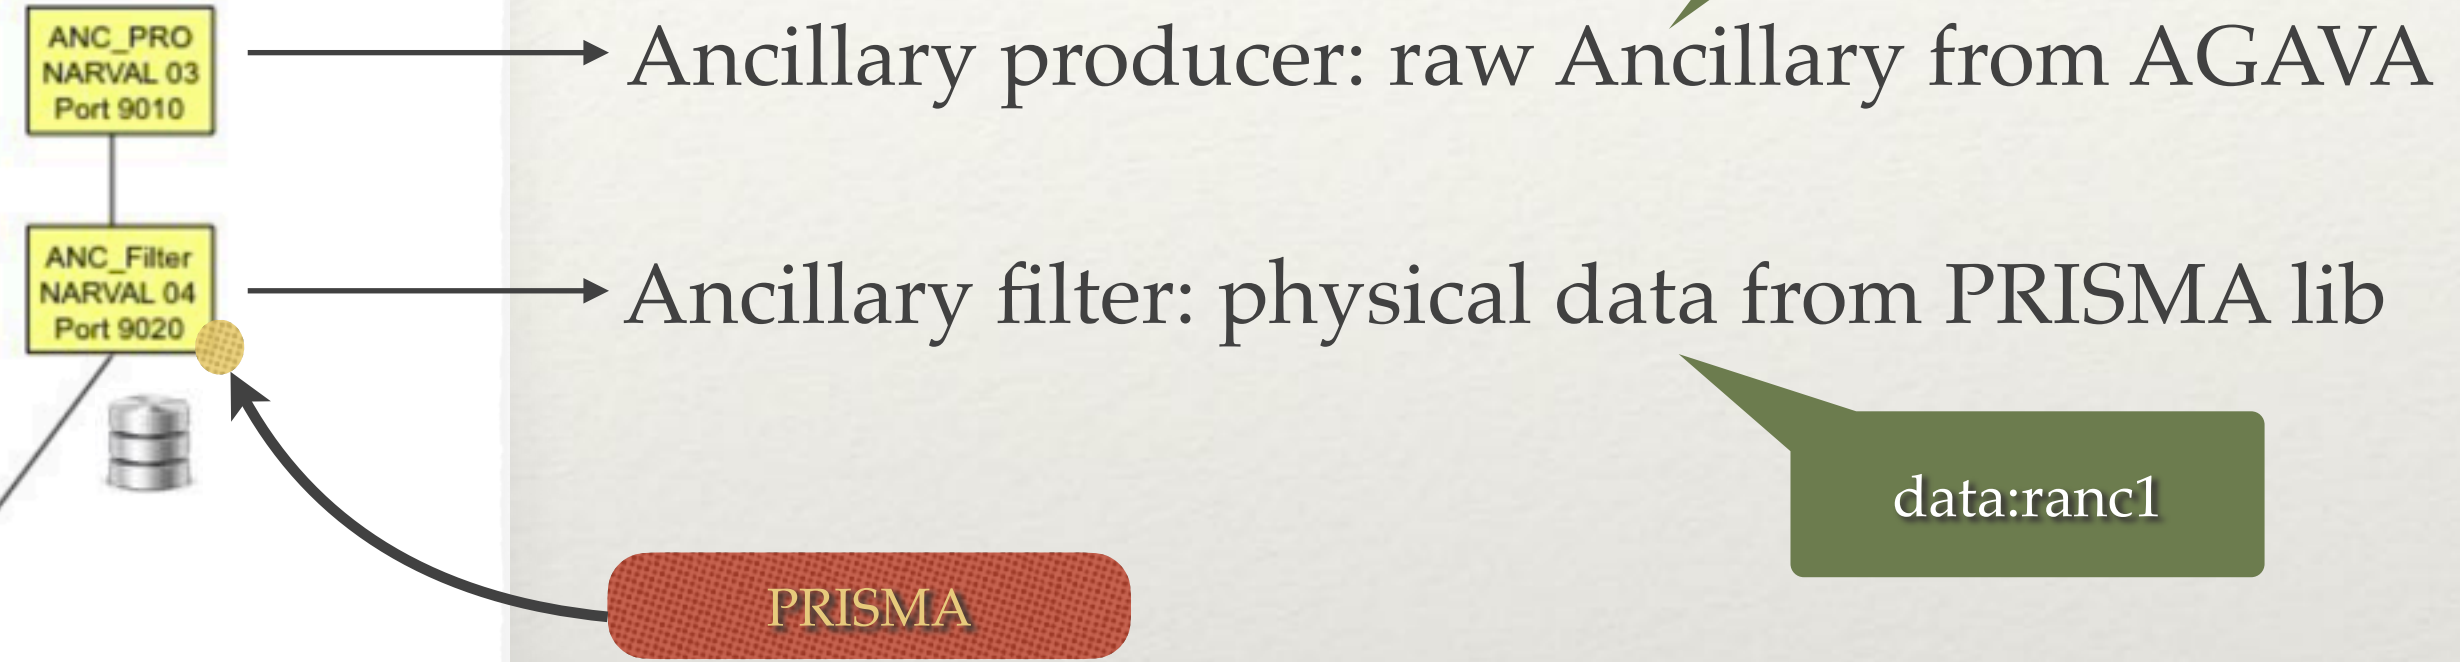

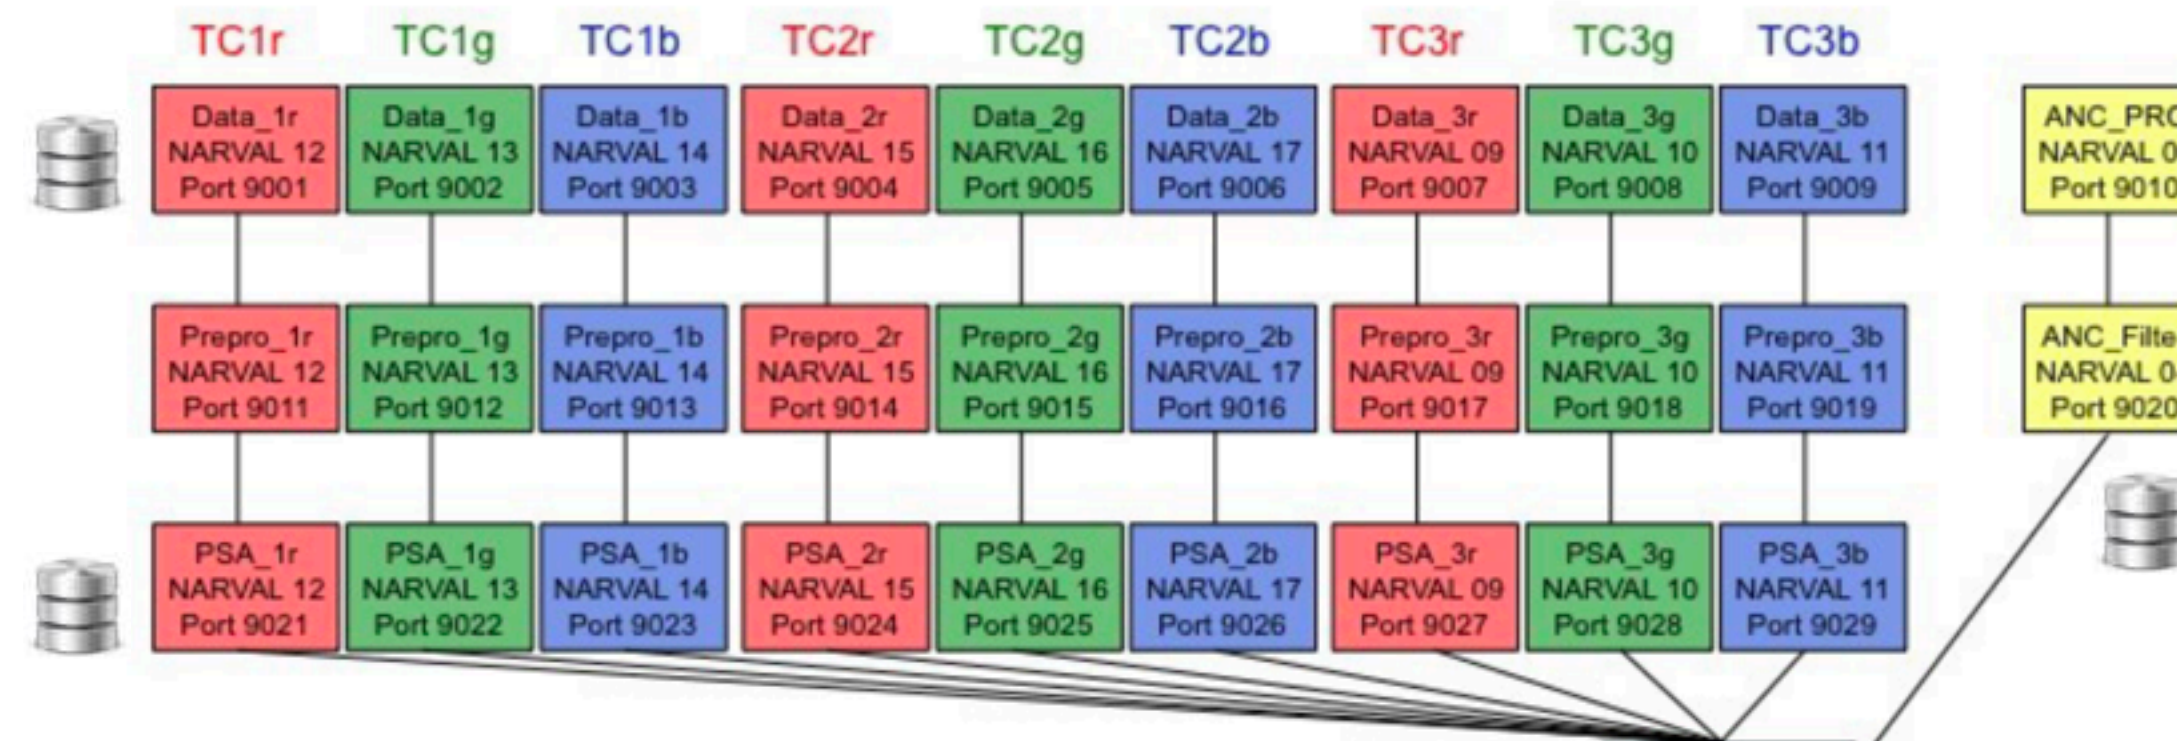

Demonstrator @ Legnaro!

Slides from the past ...

Topology at the beginning of AGATA ... **We have much more Ge now !**

data:ranc0

Ancillary producer: raw Ancillary from AGAVA

Ancillary filter: physical data from PRISMA lib

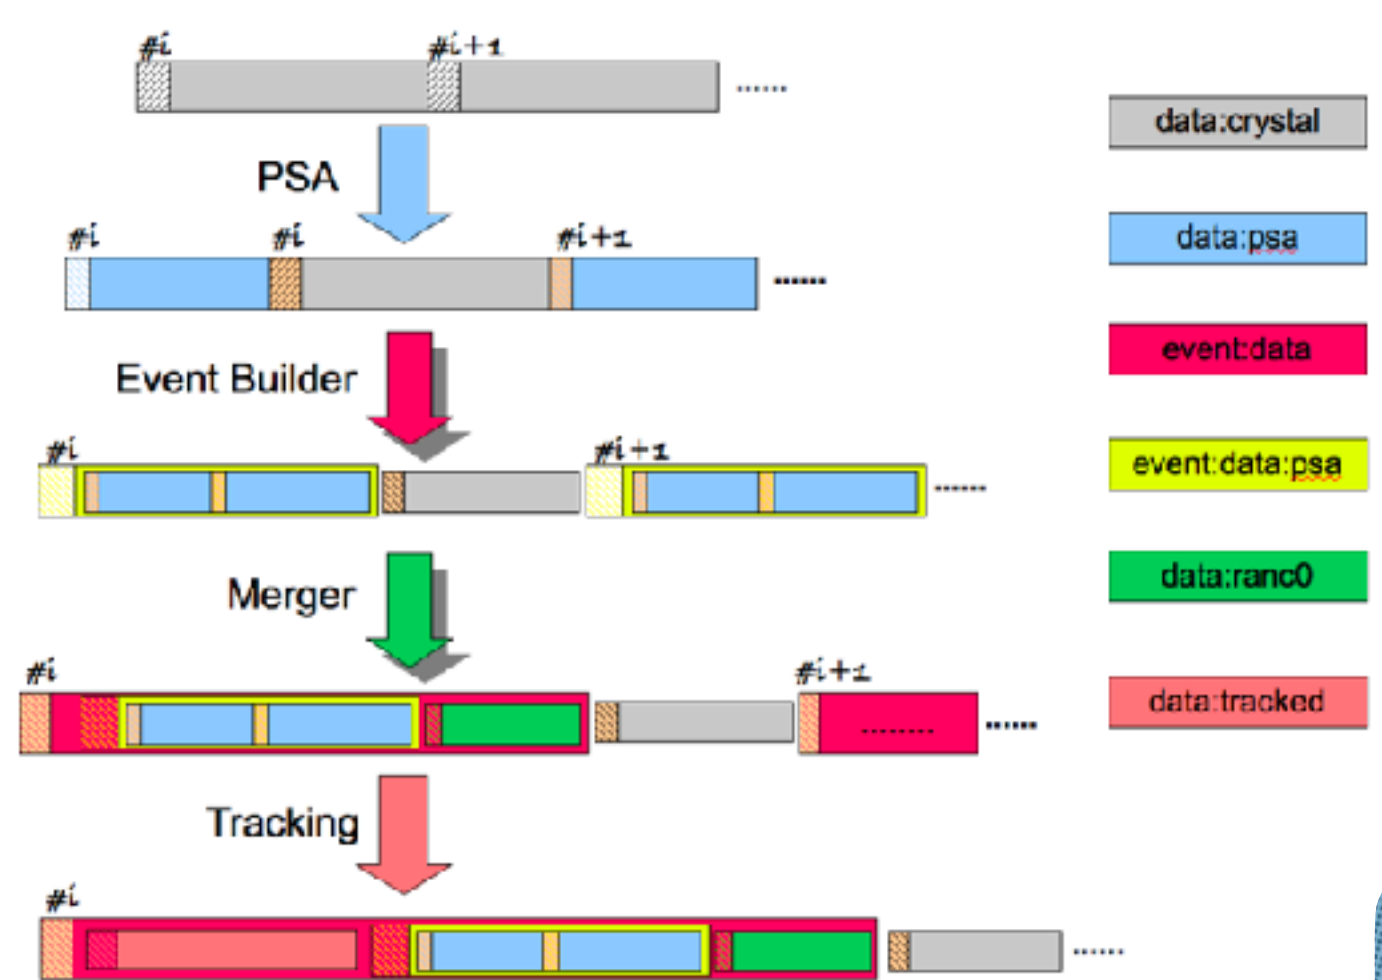

data:ranc1

PRISMA

Merged at the same level

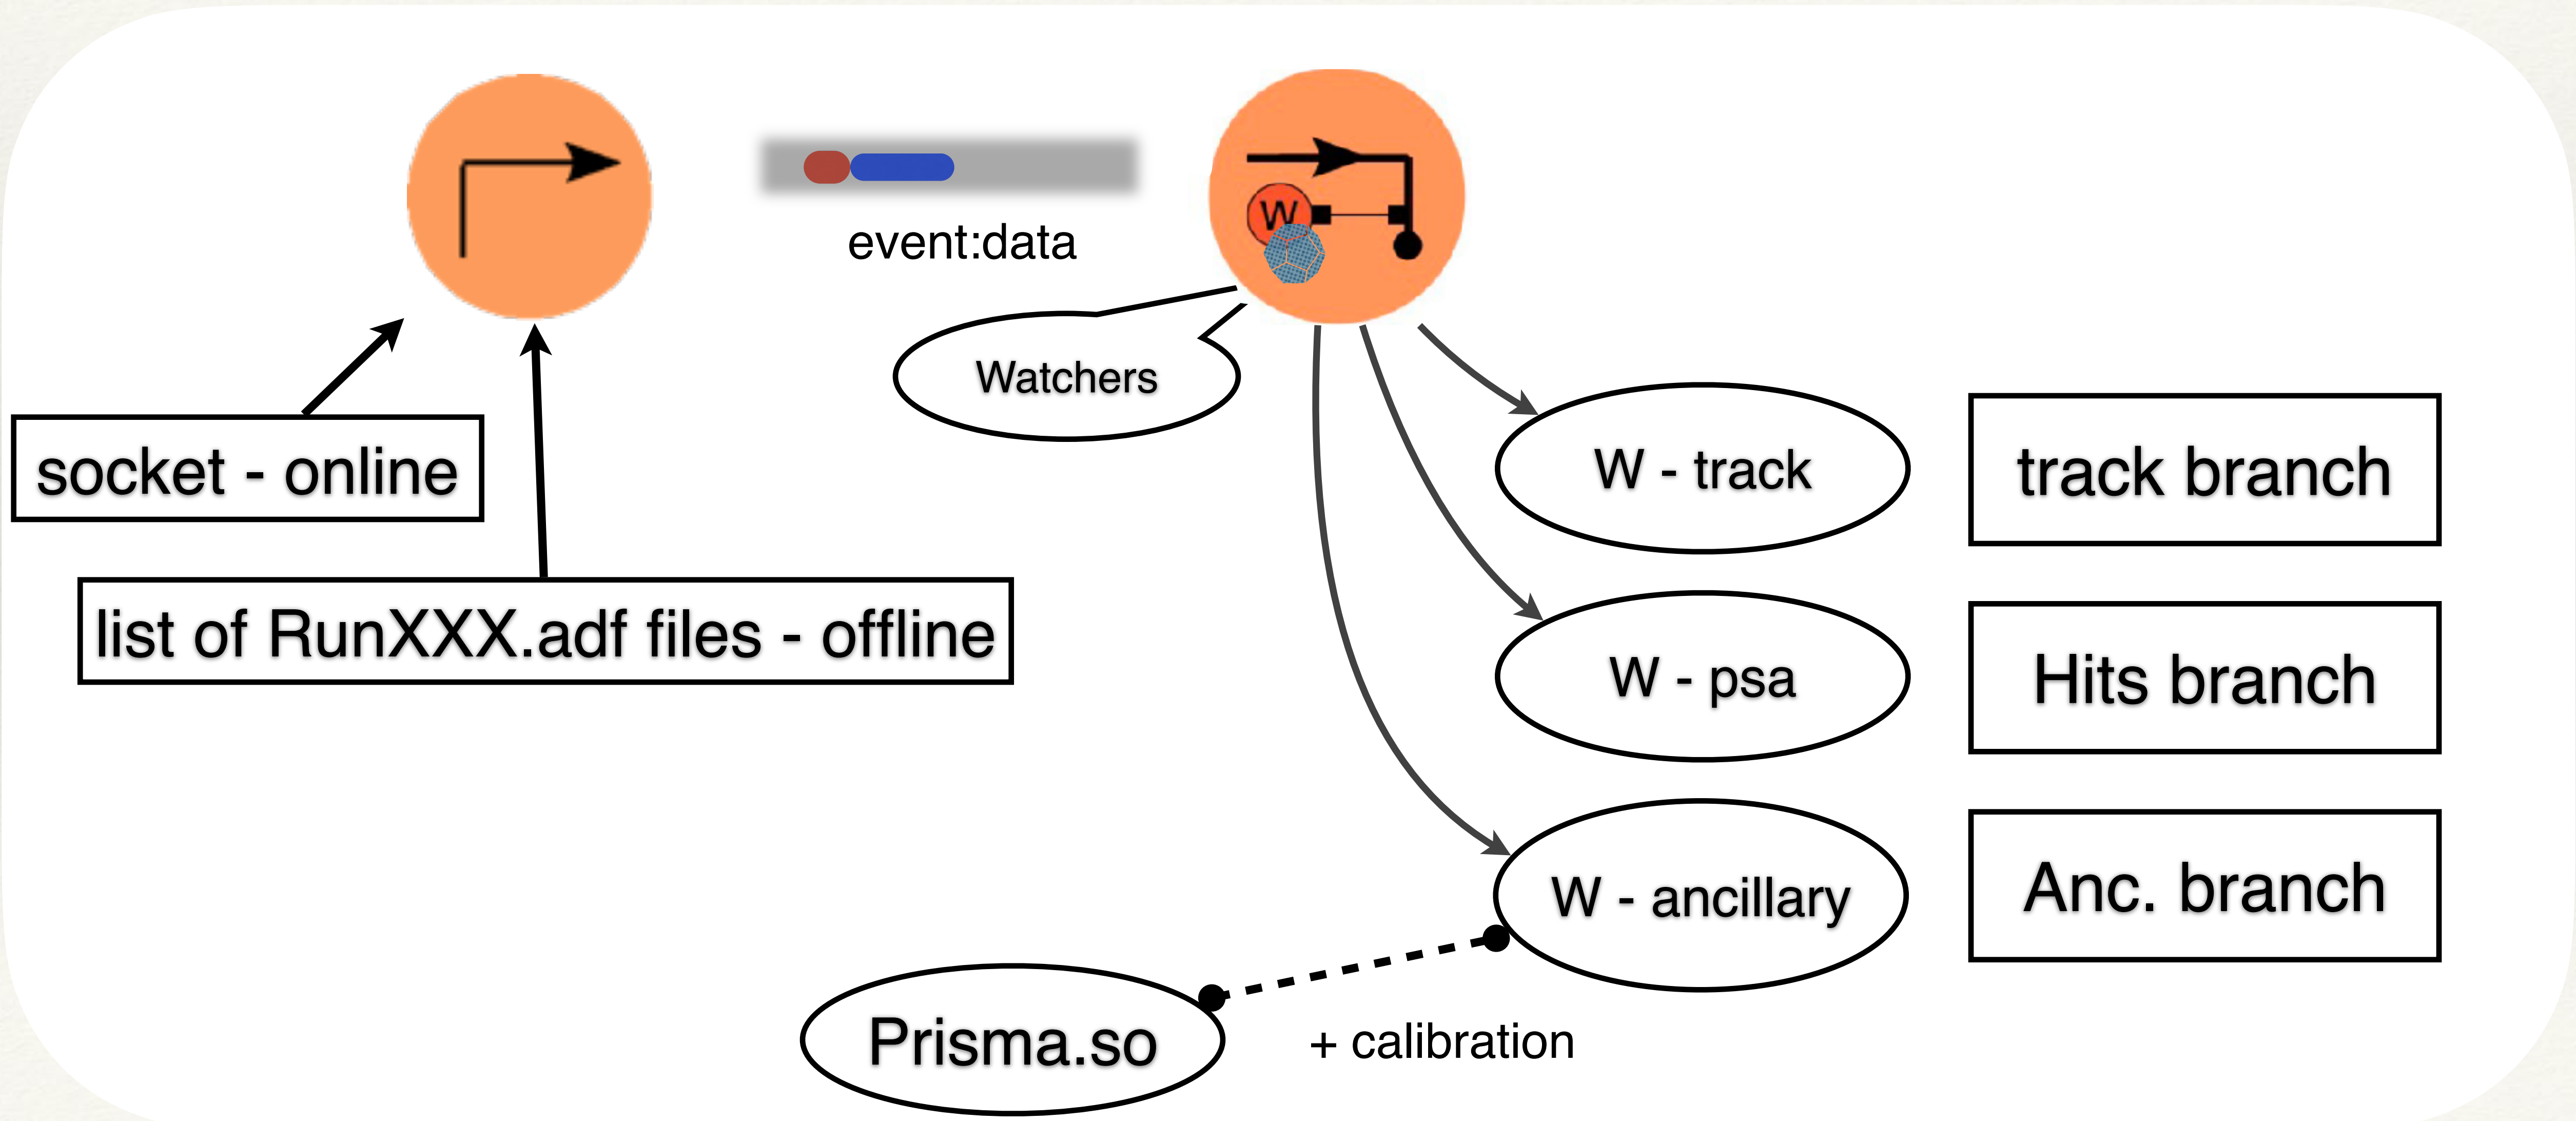

Watchers : tasks to specific frames

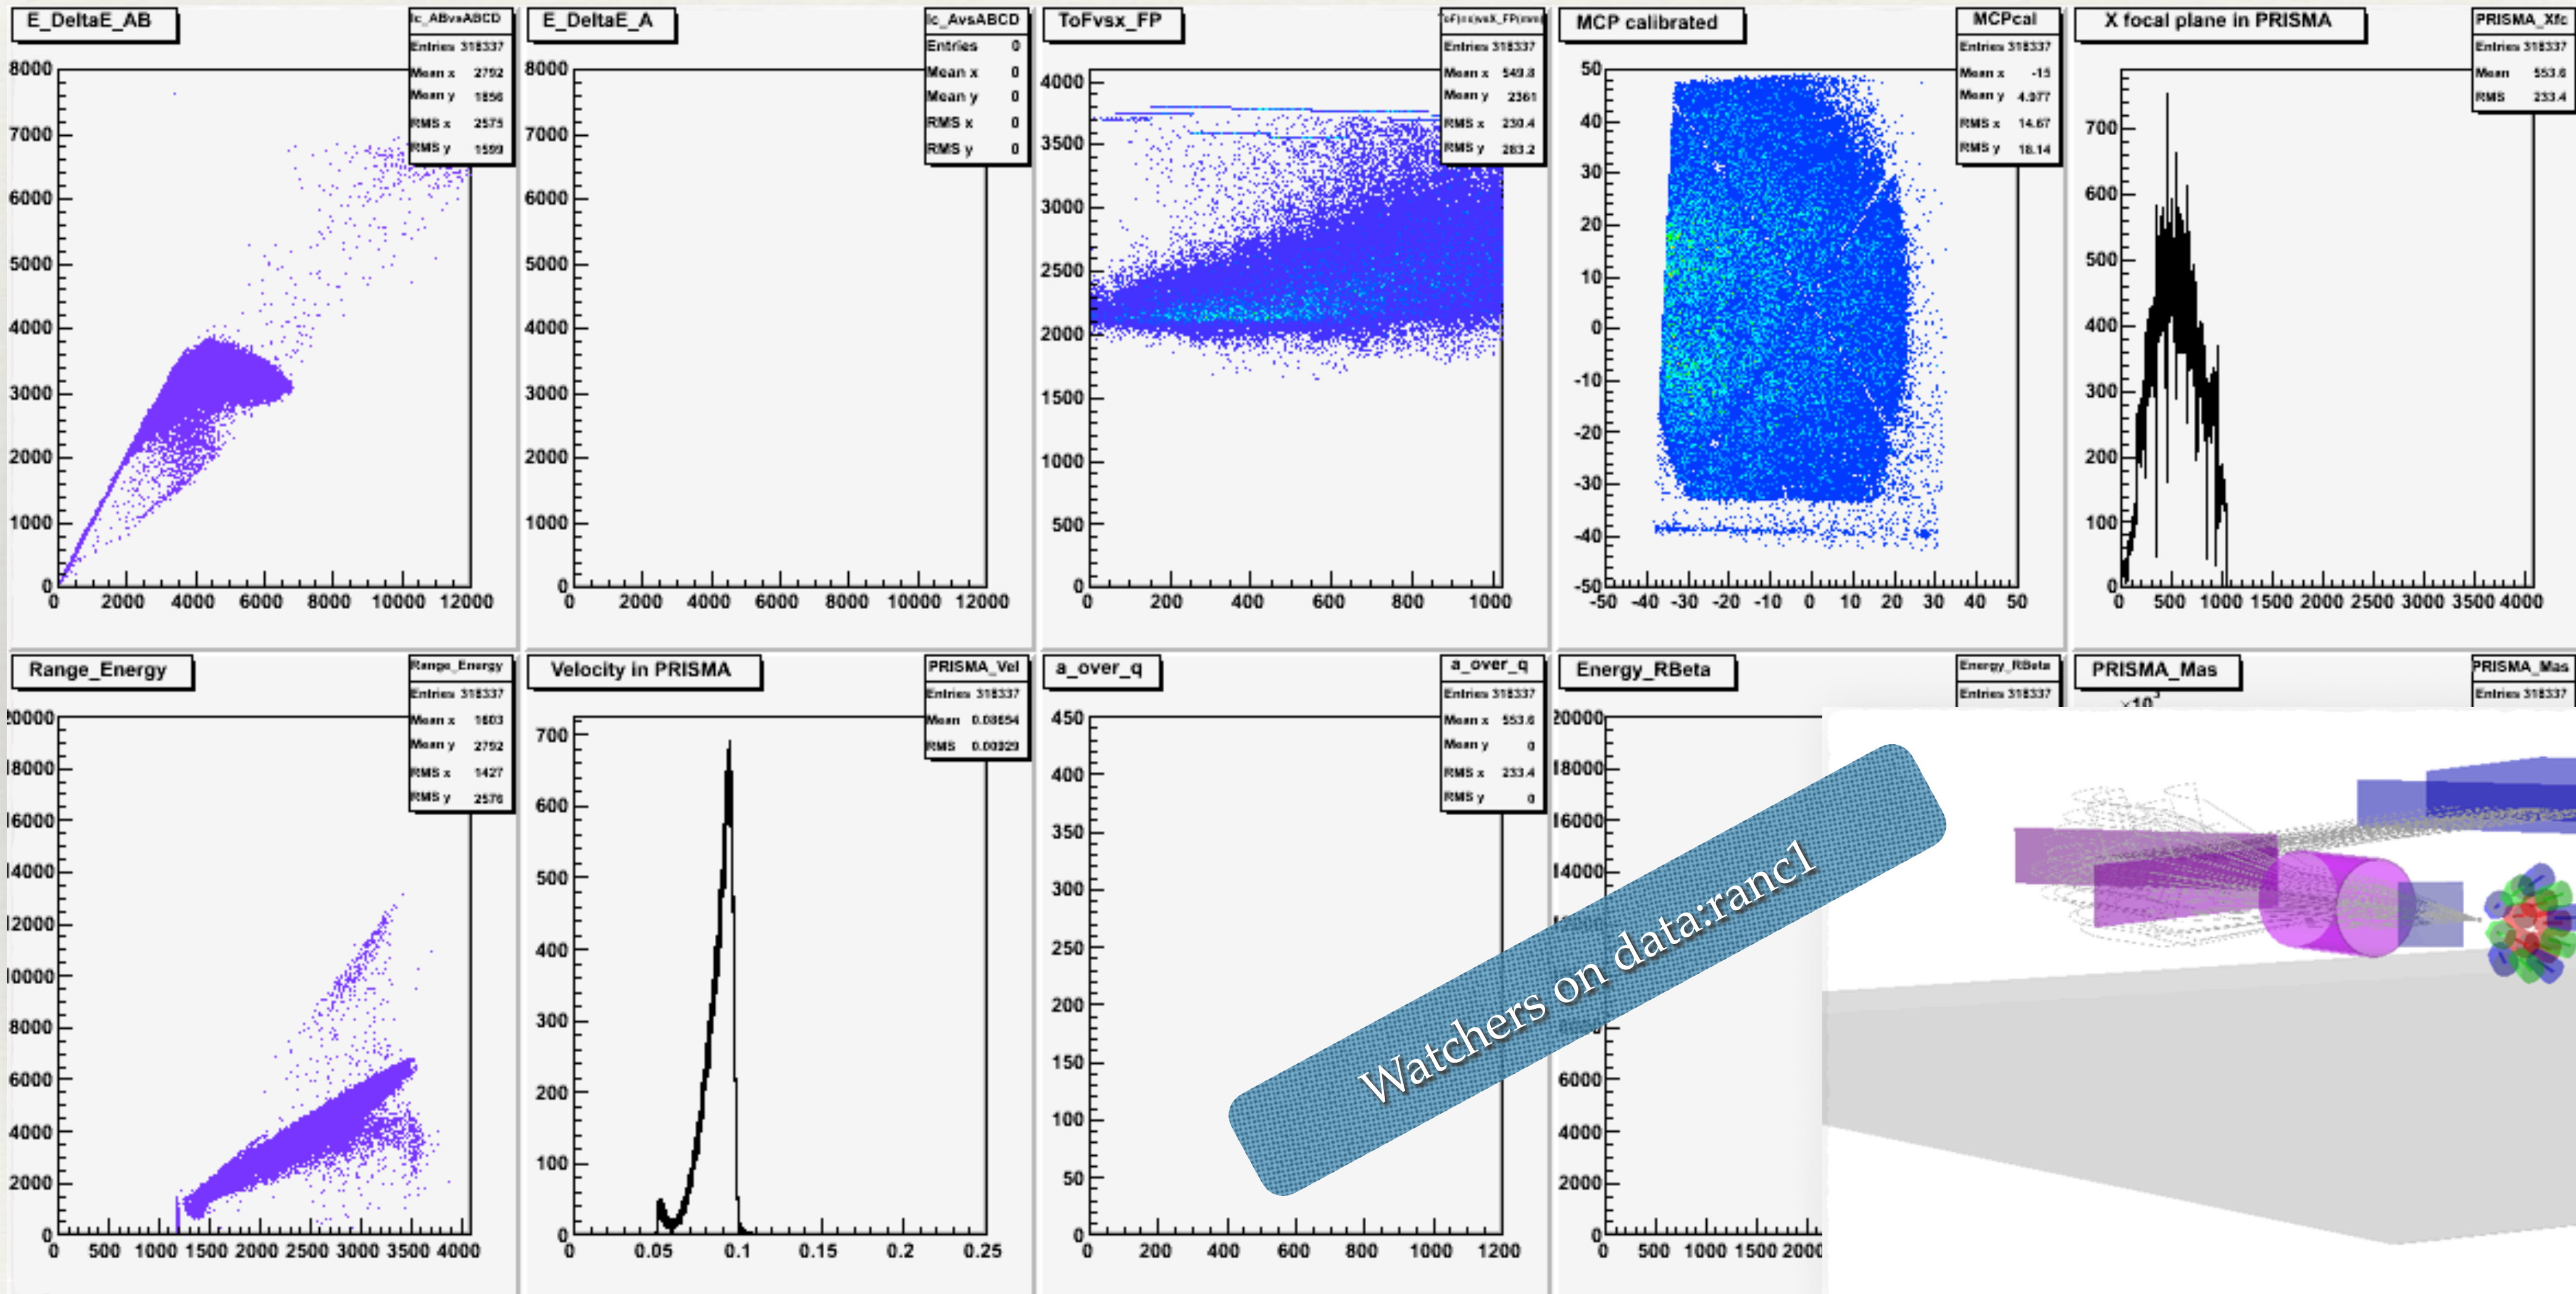

Data flow structure almost unchanged !

RunXXX.adf

Slides from the past ...

Slides from the past ...

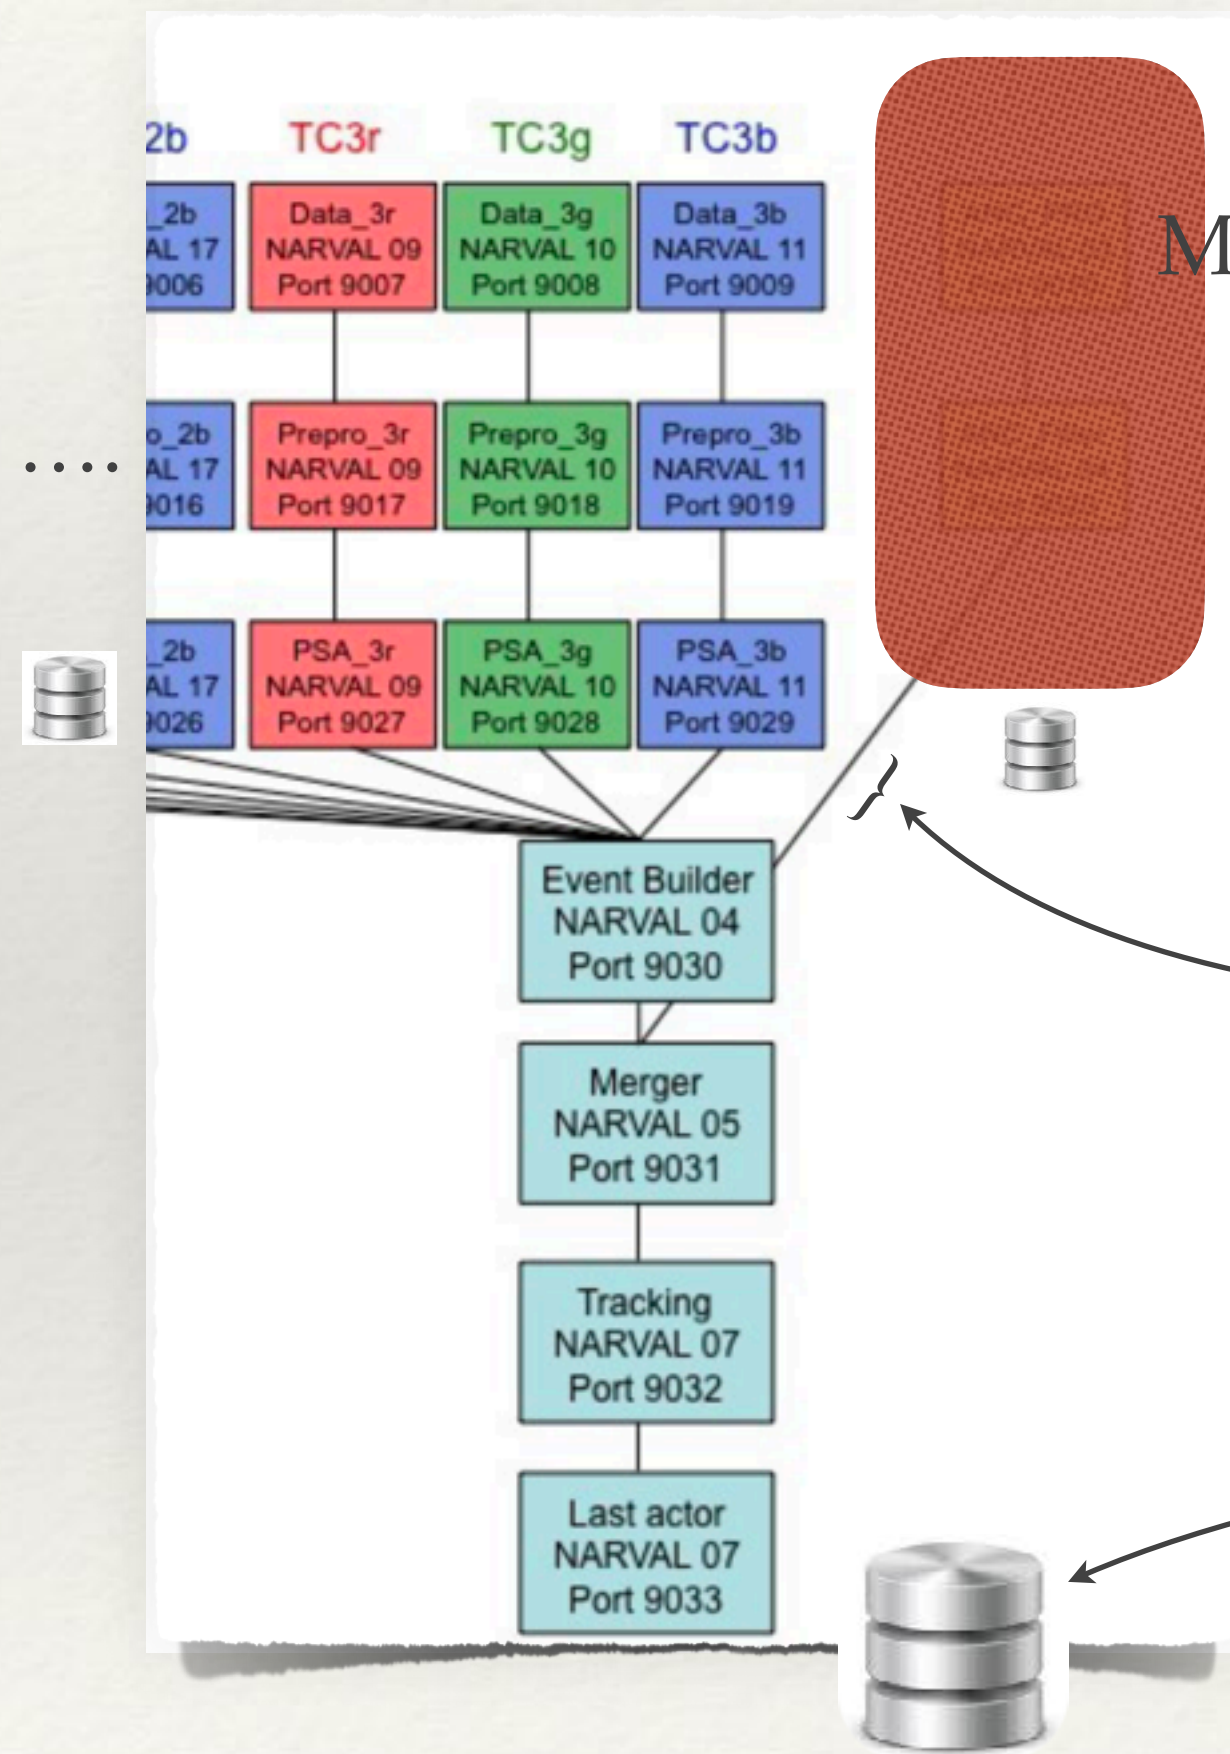

Watchers on data:ranc1

For the next campaign

More AGATA Local Level

More complex ... this part is managed by the LNL DAQ box - XDAQ NEW

NOTE: LNL xdaq data is ADF compliant

In the AGATA world, again :

data:ranc0 - raw data as produced by the AGAVA card
data:ranc1 - data out of the PRISMA library

Direct storage in ROOT TTrees ! NEW

For the next campaign

PRISMA lib 2010

- Distributed tarball
- Makefile to build

PRISMA lib 2020-

- In a git repository https://baltig.infn.it/prisma/prisma_library
- Cmake (almost done)

Move code

from Watchers to TreeBuilder

Move code

from Watchers to AGASPY

To be done... should not be time consuming ...

Distributions:

Data will be on the GRID

GridDataSync.py script to get them in https://gitlab.in2p3.fr/IPNL_GAMMA/scripts

Software on git

gRaySoftware.py script to get them in https://gitlab.in2p3.fr/IPNL_GAMMA/scripts

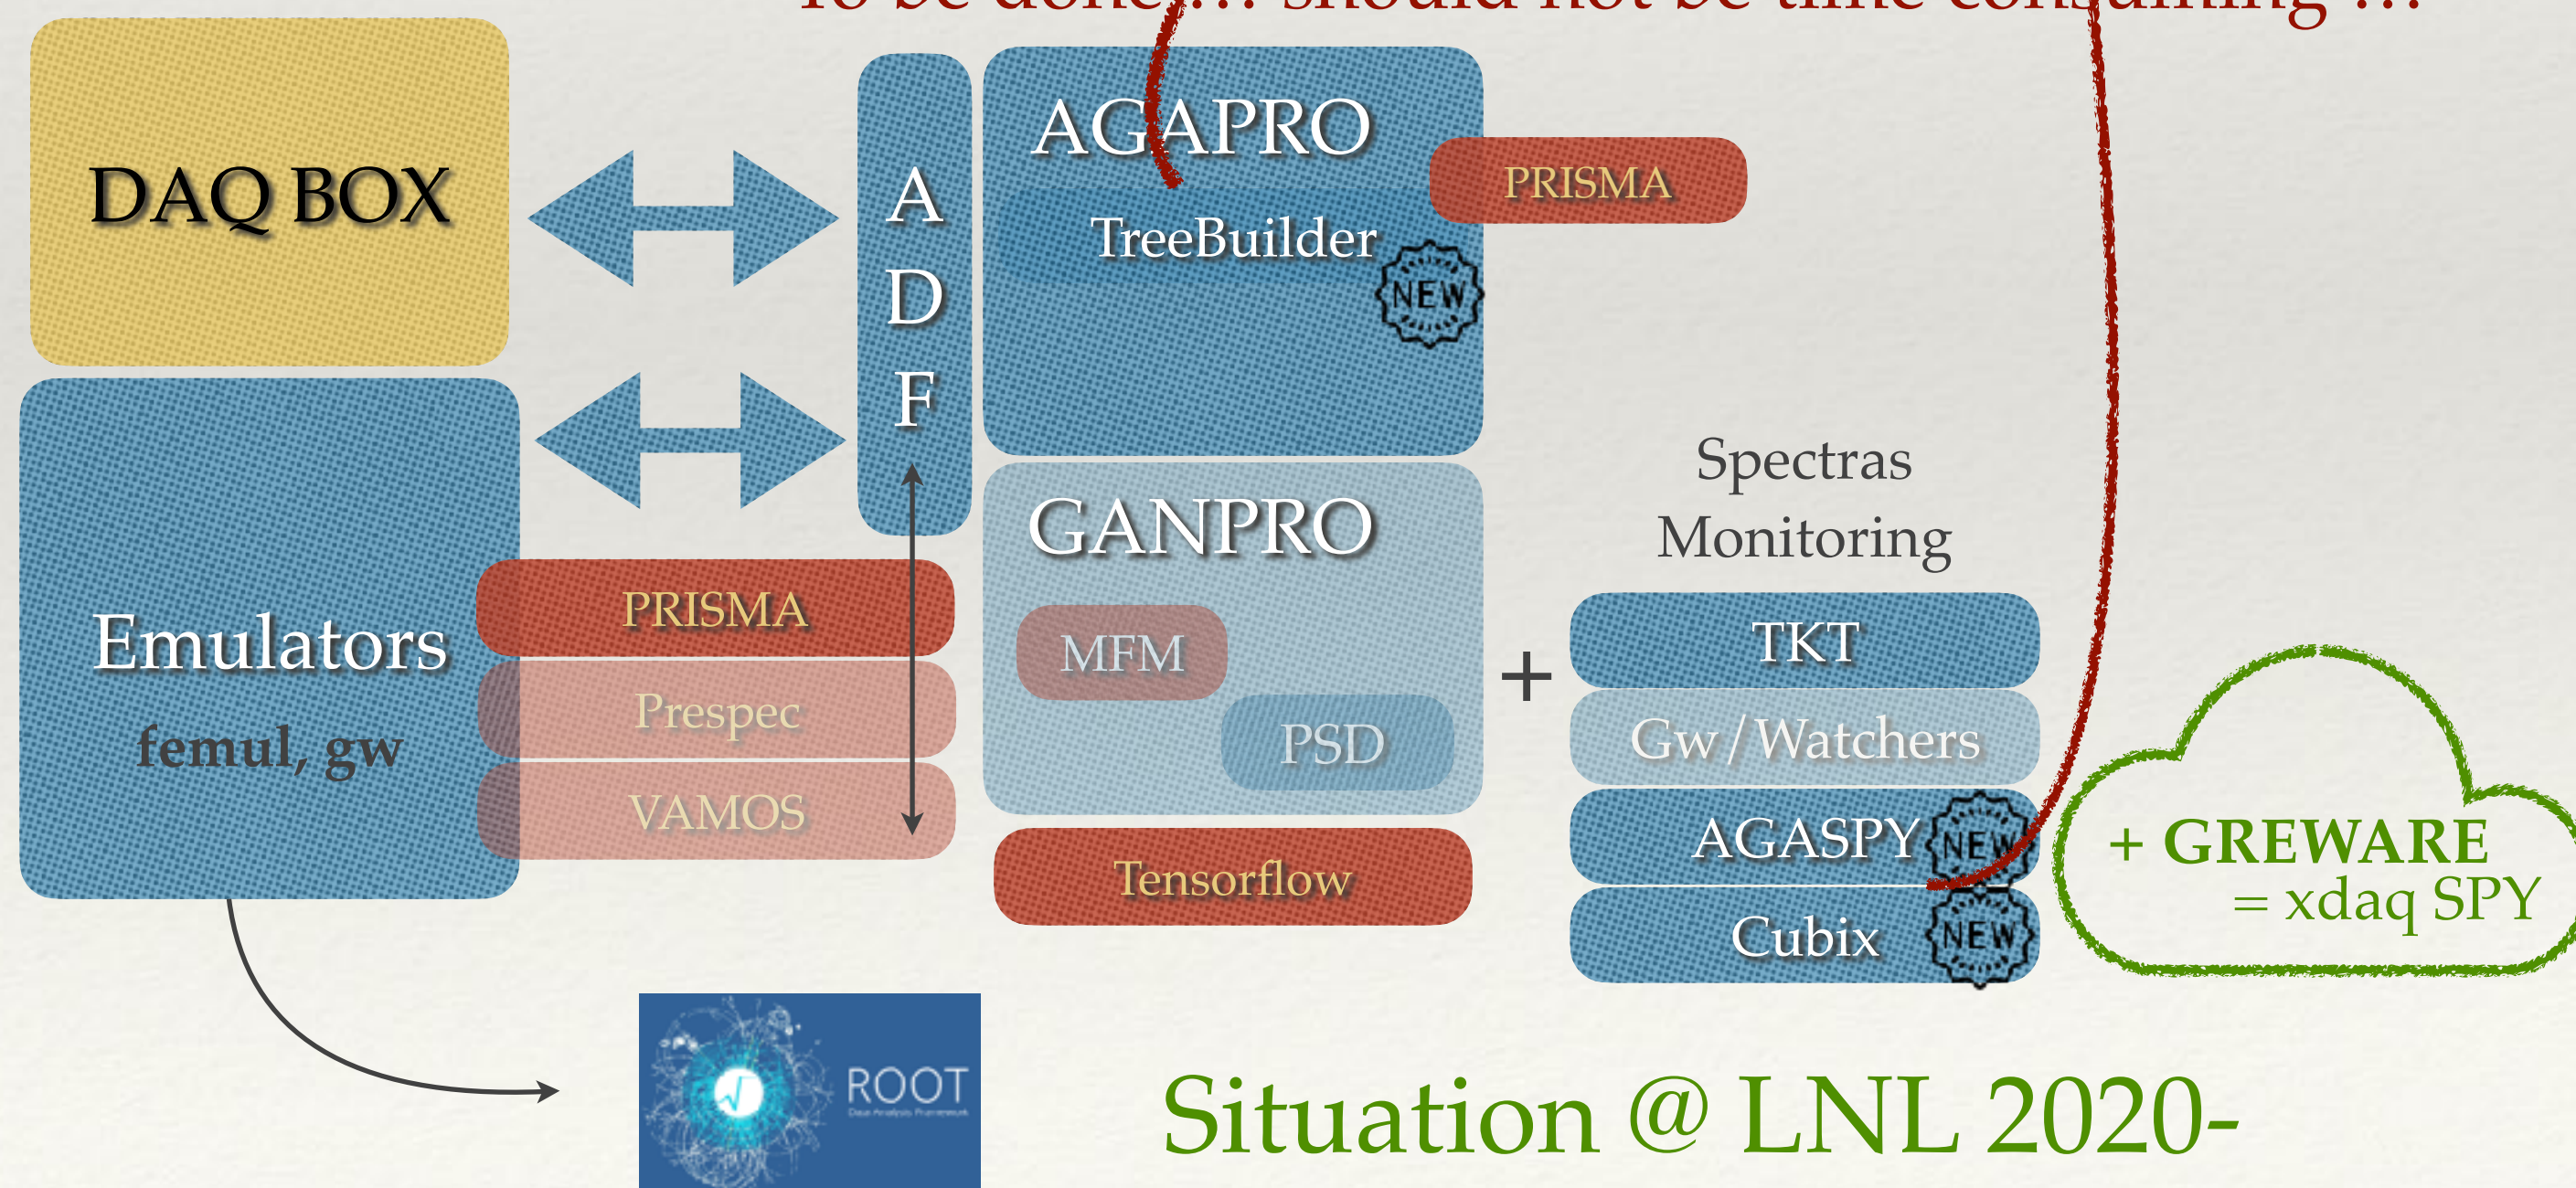

→ libPRISMA to be added ... but almost trivial if git/cmake

docker

+ container with « all » the software installed in it!

libPRISMA to be added ...

Situation @ LNL 2020-

For the next campaign ... few words about containers

Containers are 'light' virtual machines

- Applications come with their dependencies ☞ no need to worry about missing libraries, versions issues etc ...
- On LINUX machines, no CPU overhead

It requires to have docker or singularity installed on the machine

- Singularity might be 'safer'. Contrary to docker, the user is not root in the container
- One can run a docker in singularity ...

In gitlab, docker are used to test automatically compilations (=continuous integration)

A full docker is produced and available here gitlab-registry.in2p3.fr/ipnl_gamma/docker_gamma:prod

>
_
Example

3 - link the directory with all the AGATA data

```
sudo docker run -e "HOME=/home/developer" -v $HOME:/home/developer --rm -it --user $(id -u):$(id -g) gitlab-registry.in2p3.fr/ipnl_gamma/docker_gamma:prod
Unable to find image 'gitlab-registry.in2p3.fr/ipnl_gamma/docker_gamma:prod' locally
prod: Pulling from ipnl_gamma/docker_gamma
f22ccc0b8772: Pull complete
3cf8fb62ba5f: Pull complete
e80c964ece6a: Pull complete
9bed514c2952: Downloading [==
```

1 - Downloaded first time

2 - you are in the container It looks like standard shell

```
I have no name!@9ff0b12a56d4:/$ ls /opt
AgataSoftware  data  install_agata.sh  root  tensorflow
I have no name!@9ff0b12a56d4:/$ls /opt/AgataSoftware/bin/
ListFrames  MFMtest  RecalEnergy  SortCapsule  SortFFTSortPsaHits  femul  xTalkInvert  xTalkMake  xTalkSort
```

exit

4 - exit to stop the container

Conclusions

Goals :

Start the second LNL campaign avoiding new developments: only what is mandatory to run « easier » because of the first campaign and because the main ingredients are still used

Still some work to be done for the first weeks but it should not required huge steps
(I might be wrong ! Hopefully not ...)

- ☞ container technologies into the game, even if not mandatory
- ☞ However, probably better to get use to ...

Future :

Important developments are foreseen to face the future ...

... to be integrated once the system is operational at Legnaro !
