Higgs decays

Decays of a 125 GeV Standard-Model Higgs boson

Higgs coupling strength depends to particle mass!

- **Challenging...**

- ✓ Very rare!
 - $BR(H \rightarrow \mu\mu) = (2.17 \pm 0.04) \times 10^{-4}$
- ✓ A lot of background!
 - S/B ~ 0.1% level
 - S/B $H \rightarrow \gamma\gamma$ ~5-10%

- **... but very interesting!**

- ✓ Coupling to second generation fermions!

- **Results announced in Summer 2020**

- ✓ ATLAS [arXiv:2007.07830](https://arxiv.org/abs/2007.07830)
- ✓ CMS [CMS-PAS-19-006](https://arxiv.org/abs/1906.00064)

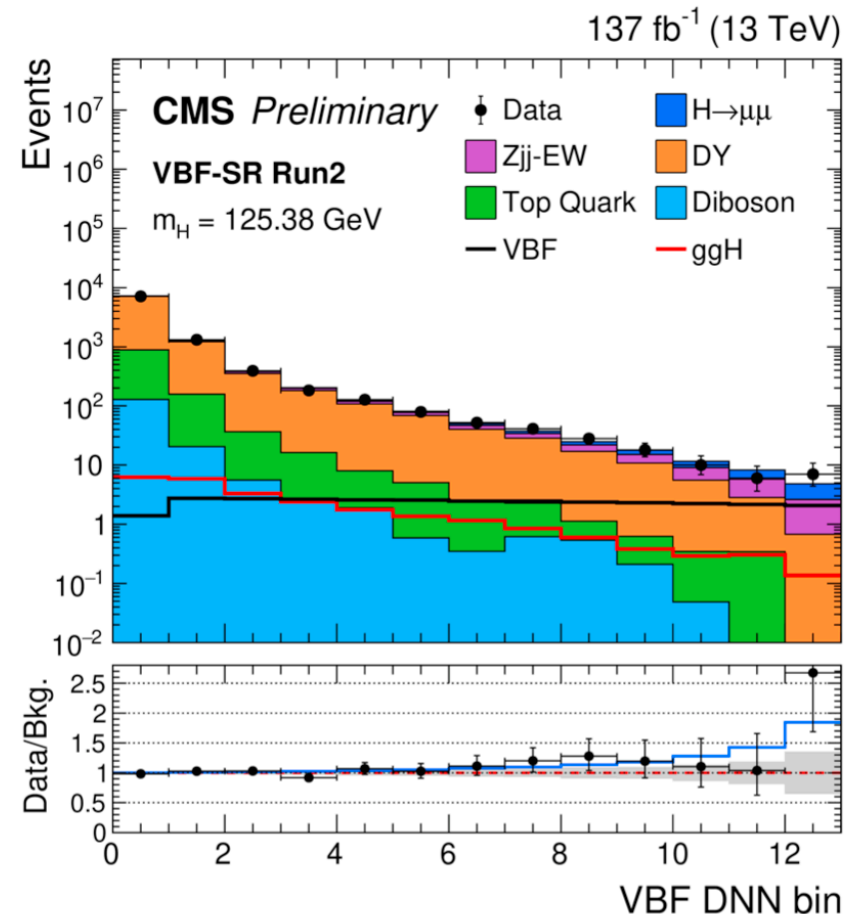

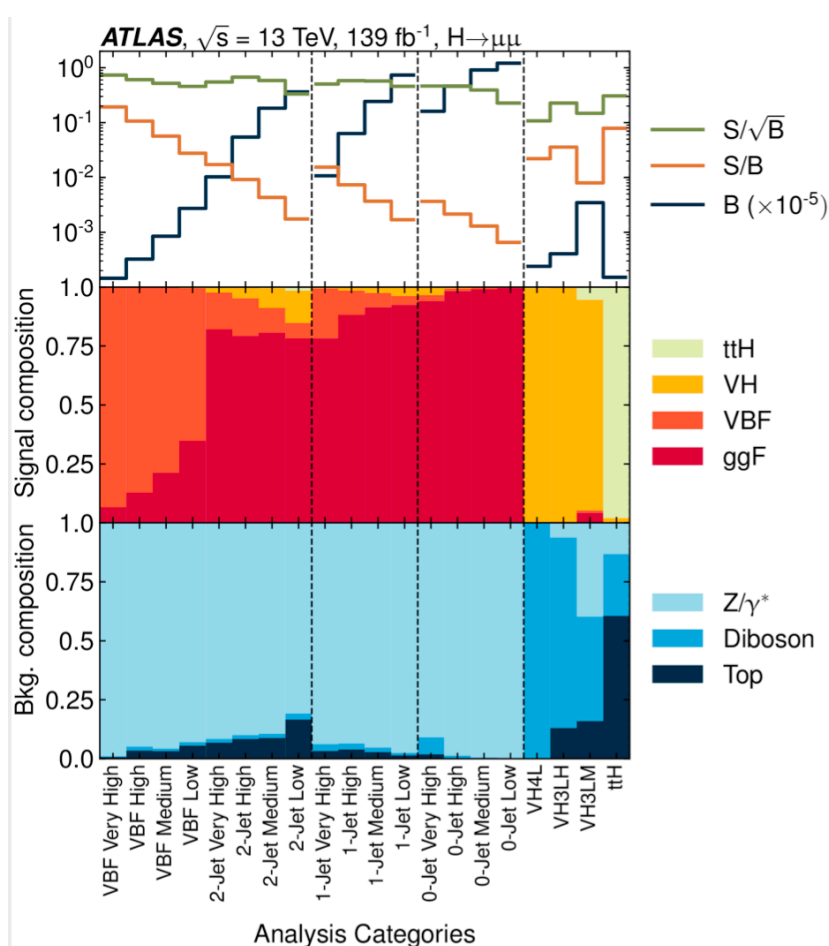

||

$\approx 1.28 \text{ GeV}/c^2$	$\frac{2}{3}$	$\frac{1}{2}$	C	charm
$\approx 96 \text{ MeV}/c^2$	$-\frac{1}{3}$	$\frac{1}{2}$	S	strange
$\approx 105.66 \text{ MeV}/c^2$	-1	$\frac{1}{2}$	μ	muon
$< 0.17 \text{ MeV}/c^2$	0	$\frac{1}{2}$	ν_μ	muon neutrino

H \rightarrow $\mu\mu$: a couple of experimental details...

- Data separated in production mode enriched categories...
- “Typical” S+B fits both by ATLAS and CMS (“bump hunting”), but CMS introduced **DNN score template fit in VBF category!**

H → μμ: an evidence and a quasi-evidence...

- **CMS:**

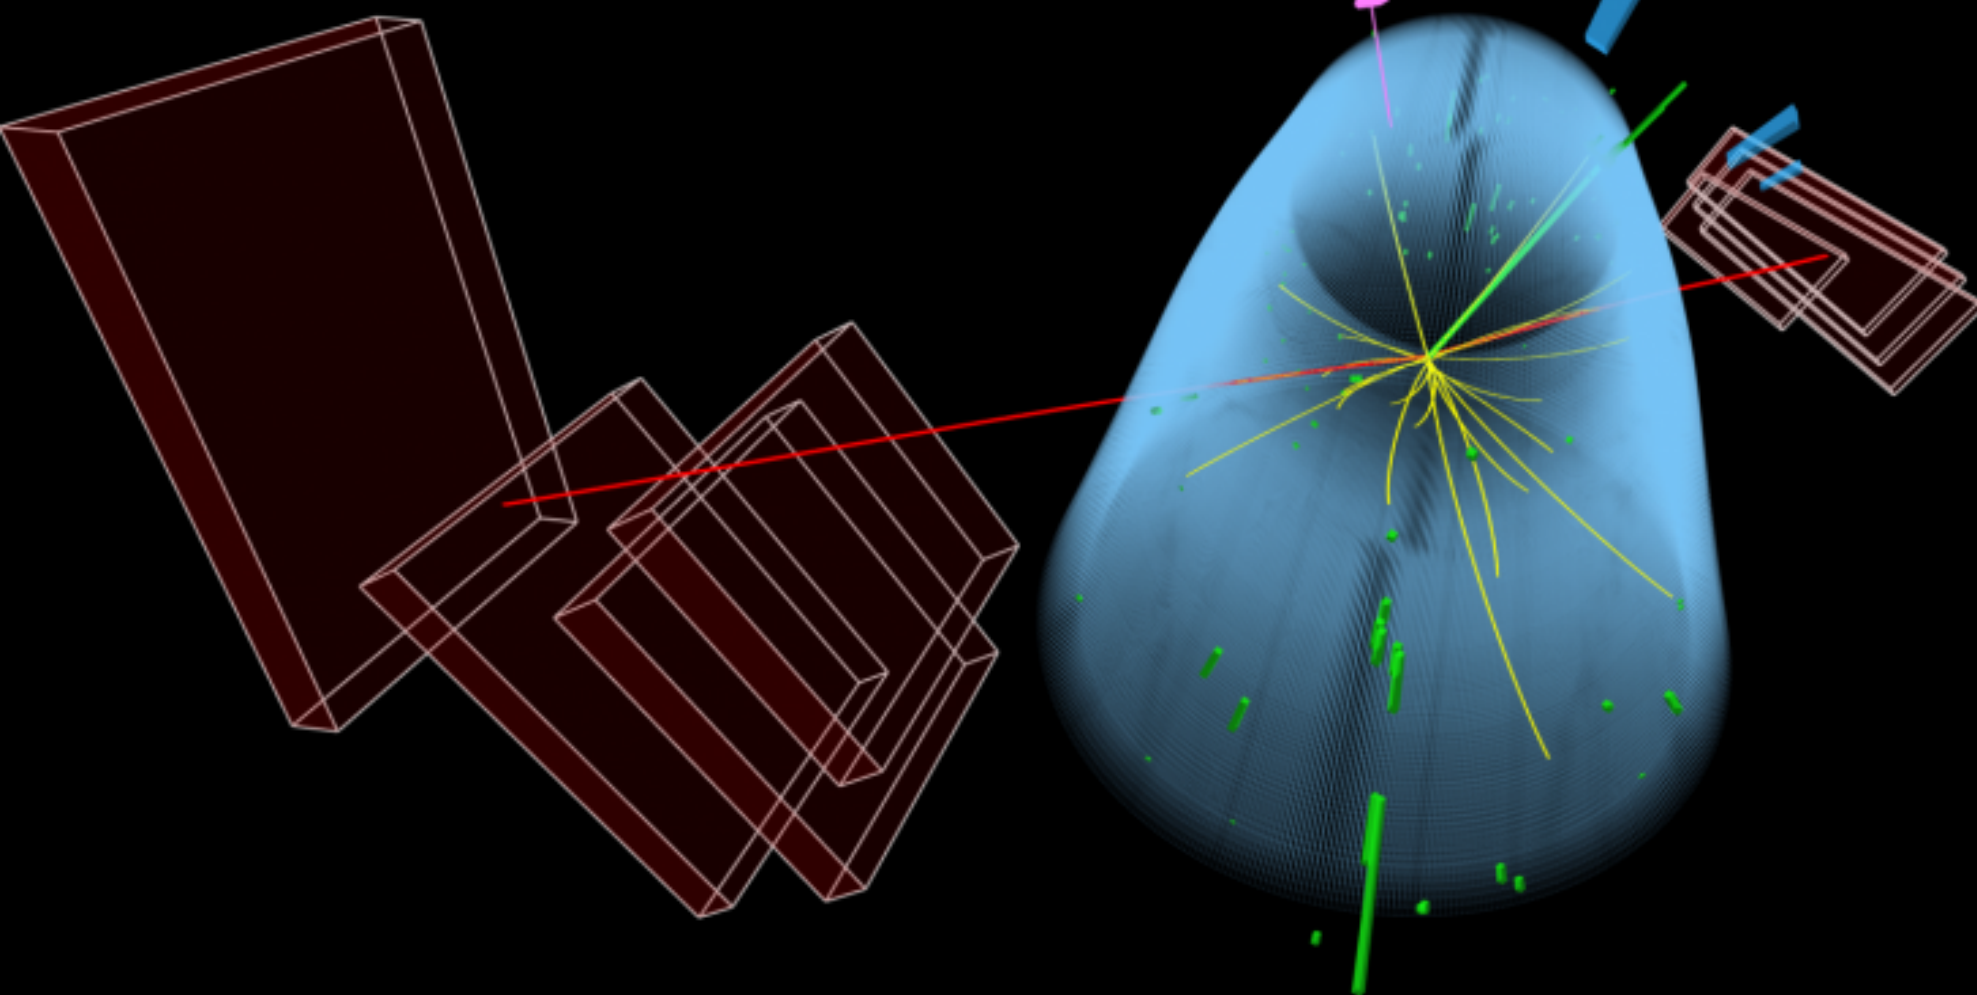

- Compatibility with **B-only** hypothesis **2.95 σ** (2.46 σ)
- Signal strength $\mu = 1.19_{-0.42}^{+0.44} = 1.19_{-0.39}^{+0.41}(\text{stat})_{-0.16}^{+0.17}(\text{syst})$

- **ATLAS:**

- Compatibility with **B-only** hypothesis **2.0 σ** (1.7 σ)
- Signal strength $\mu = 1.17_{-0.58}^{+0.61} = 1.17_{-0.57}^{+0.58}(\text{stat}) \pm 0.10(\text{spurious})_{-0.03}^{+0.07}(\text{exp})_{-0.08}^{+0.13}(\text{theory})$

CMS Experiment at the LHC, CERN
Data recorded: 2018-Aug-27 18:16:09.757504 GMT
Run / Event / LS: 321879 / 102476714 / 86

HIGGS AND ELECTROWEAK | NEWS

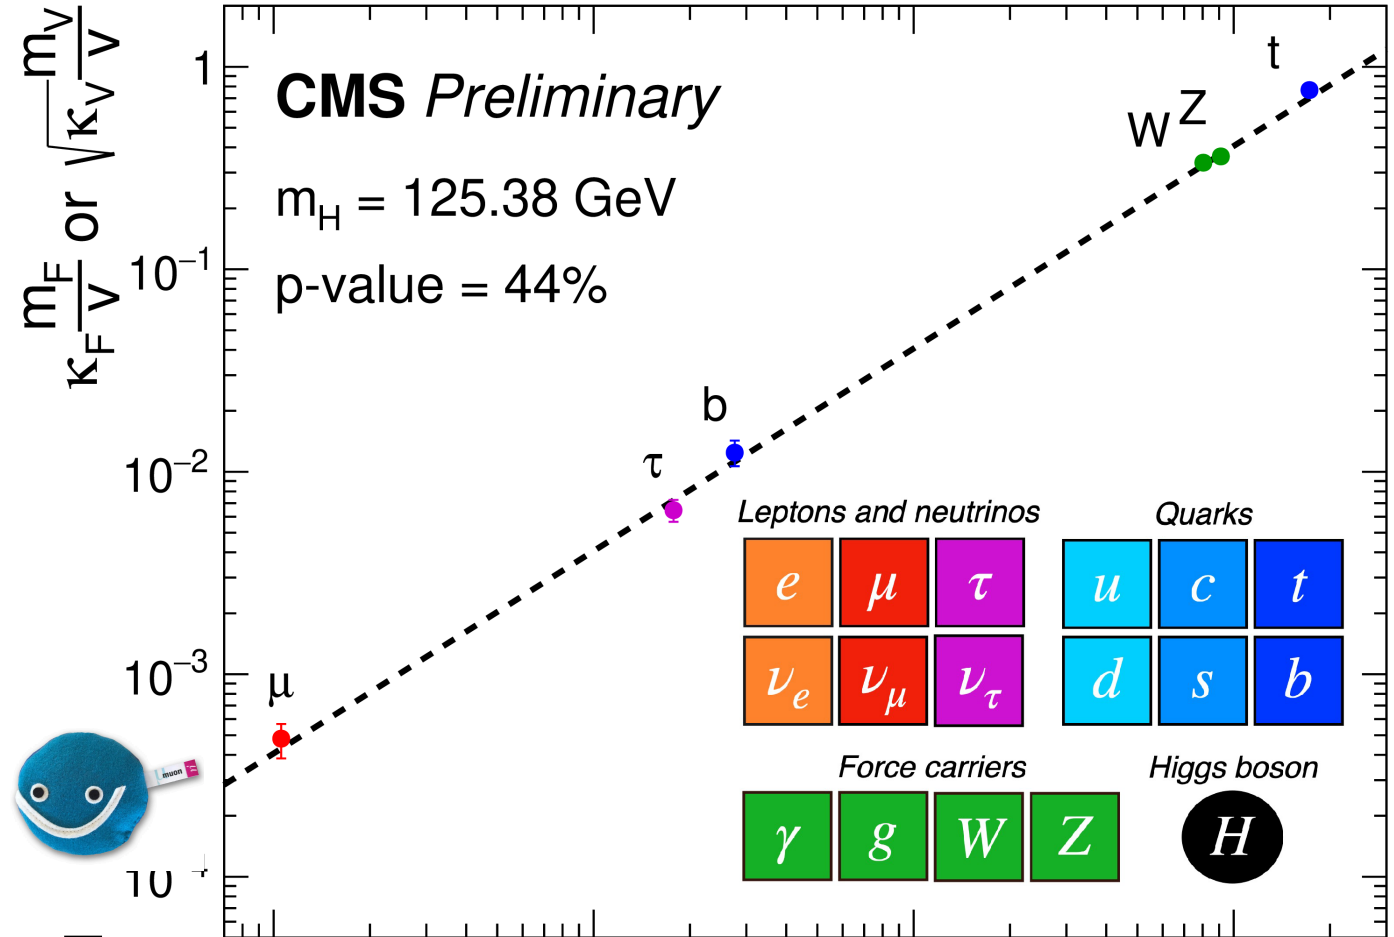

Turning the screw on $H \rightarrow \mu\mu$

9 September 2020

New topology A CMS candidate for Higgs-boson production via vector-boson fusion and its decay into two muons (red lines). Credit: CMS-PHO-EVENTS-2020-017-1

35.9-137 fb⁻¹ (13 TeV)

H \rightarrow $l l \gamma$

- **Challenging...**

- ✓ Even rarer! ($m_{ll} < 30$ GeV)

$$\mathcal{B}(H \rightarrow ee\gamma) = 7.20 \times 10^{-5}$$

$$\mathcal{B}(H \rightarrow \mu\mu\gamma) = 3.42 \times 10^{-5}$$

- **... but very interesting!**

- ✓ 3-body decay!

- ✓ Can study Higgs CP property

- **Results announced on 2/2/21!**

- ✓ ATLAS: [ATLAS-CONF-2021-002](https://arxiv.org/abs/2102.00013)

H \rightarrow $ll\gamma$: a couple of experimental details...

- Due to low mass of dilepton pair leptons often very collimated
 - ✓ Not a problem for muons
 - ✓ Electromagnetic clusters from electron can overlap in calorimeter
- Dedicated trigger and ID!

H \rightarrow $\ell\ell\gamma$: evidence!

● Observed:

$$\mu = 1.5 \pm 0.5 = 1.5 \pm 0.5 \text{ (stat.) } {}^{+0.2}_{-0.1} \text{ (syst.)}$$

$\sigma \times \text{BR}(\ell\ell\gamma) |_{m_{\ell\ell} < 30 \text{ GeV}}$:

$$8.7 {}^{+2.8}_{-2.7} \text{ fb} = 8.7 {}^{+2.7}_{-2.7} \text{ (stat.) } {}^{+0.7}_{-0.6} \text{ (syst.) fb}$$

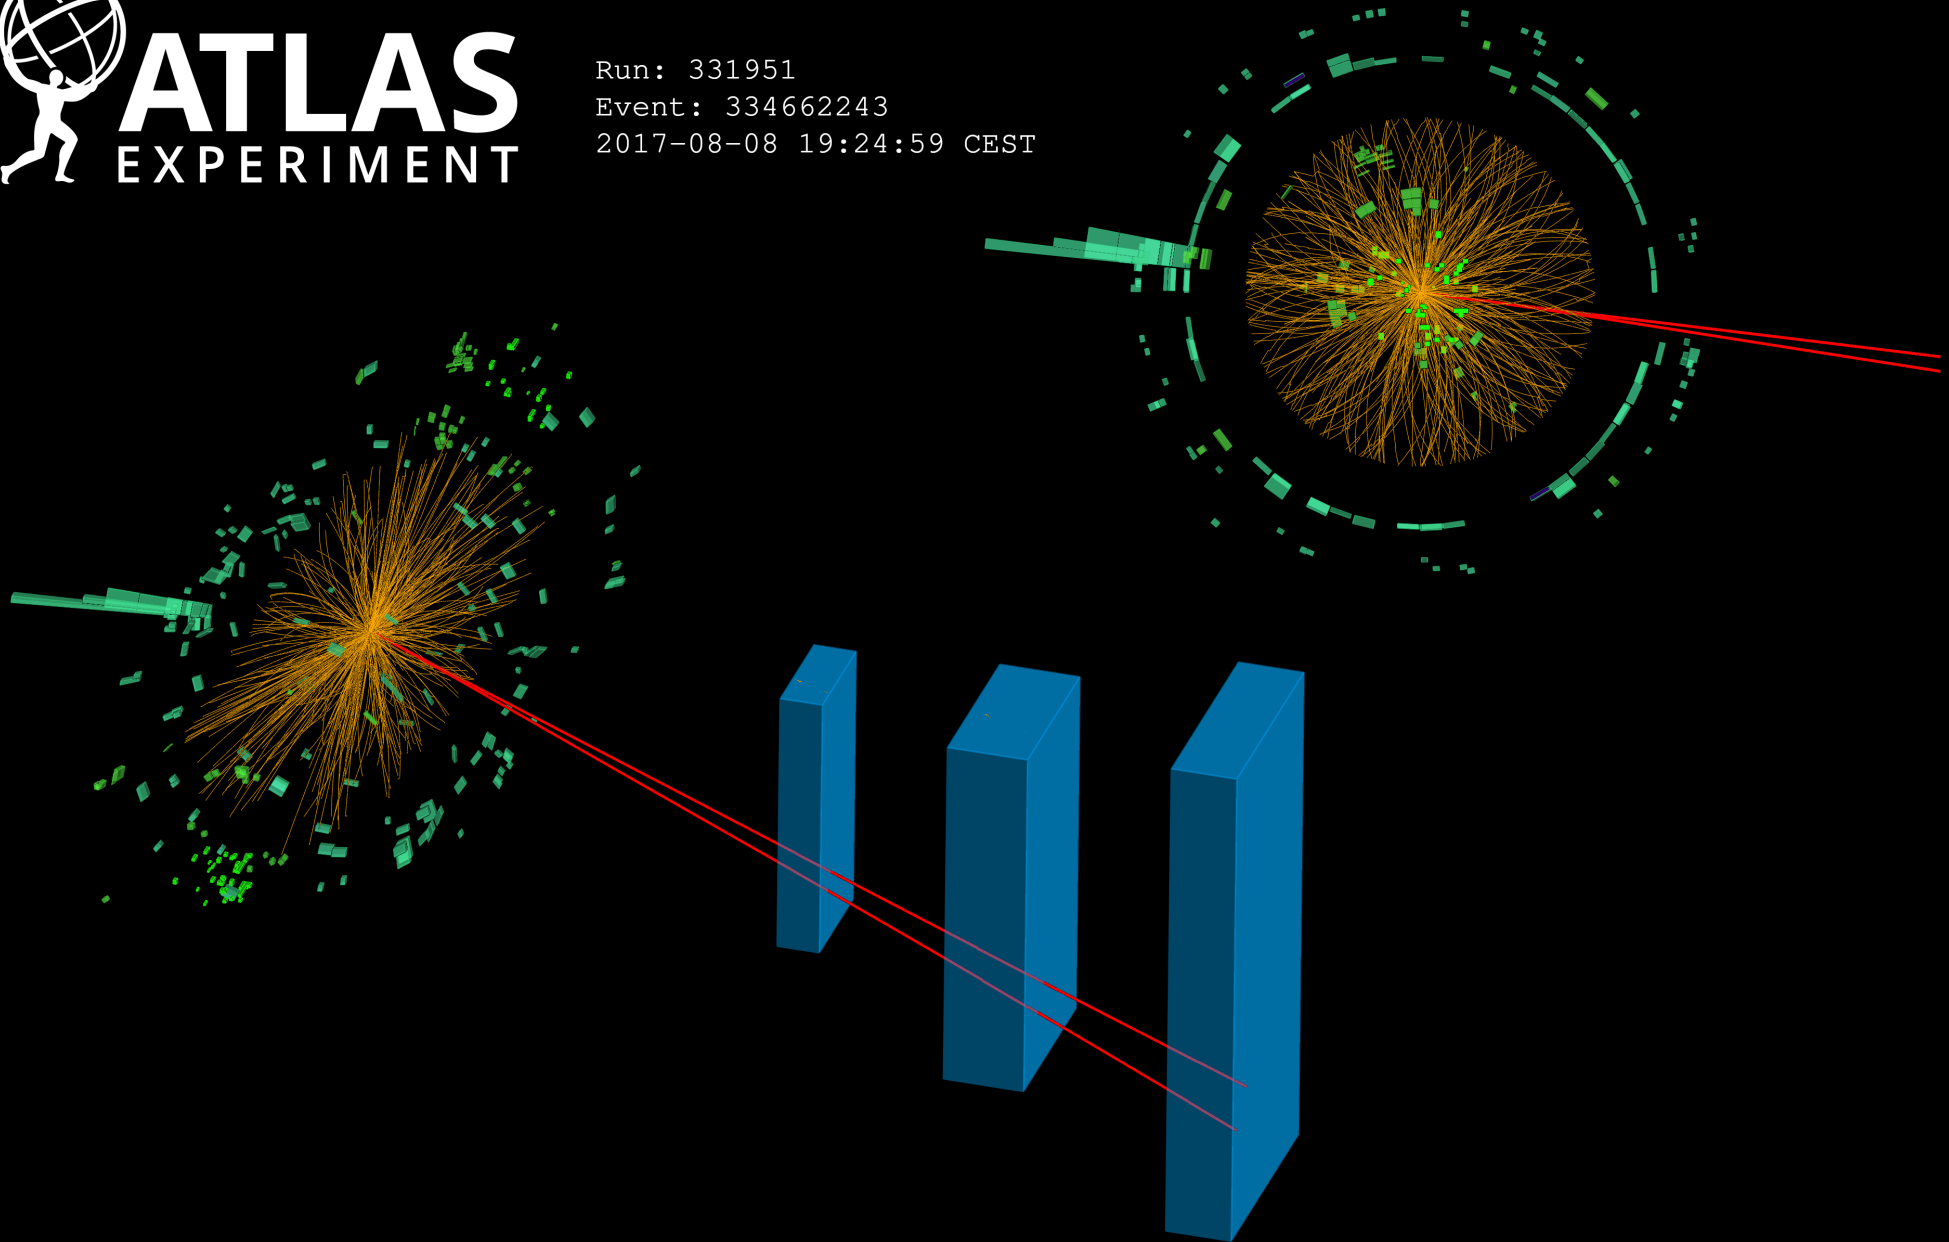

H \rightarrow $\ell\ell\gamma$: evidence!

- Significance above background-only hypothesis: 3.2σ (expected 2.1σ)
- First evidence for $H \rightarrow \ell\ell\gamma$

Run: 331951
Event: 334662243
2017-08-08 19:24:59 CEST

ATLAS

First evidence for rare Higgs–boson decay

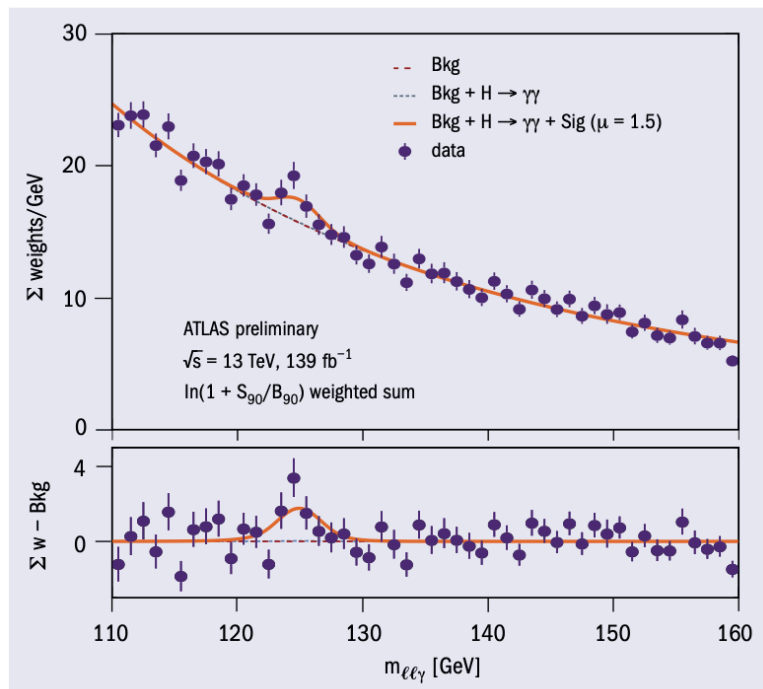

Fig. 1. Invariant mass of the $\ell\ell\gamma$ system, with every data event contributing a category-dependent weight representing the expected sensitivity of the $H \rightarrow \ell\ell\gamma$ signal. The data are shown as purple dots, while the lines show the signal and background functions as obtained by a fit.

Rare decay A candidate $H \rightarrow \mu^+ \mu^- \gamma$ decay in the ATLAS detector.
