

How well can isolated photons constrain the proton PDFs ?

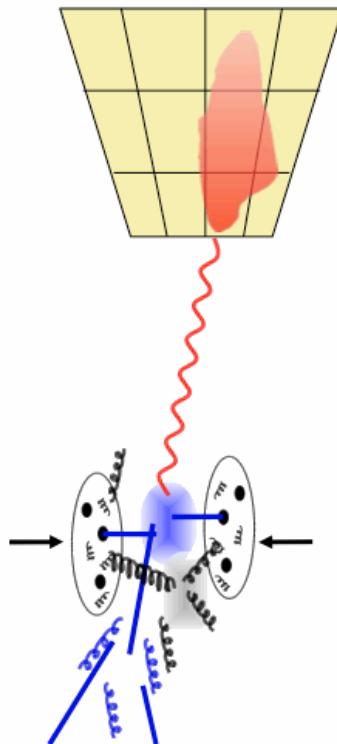

Raphaëlle ICHOU (*)

Subatech, Nantes

Workshop on Nuclear PDFs
Annecy - February 22-23th 2010

(*) Collaboration work with
David d'Enterria, François Arleo

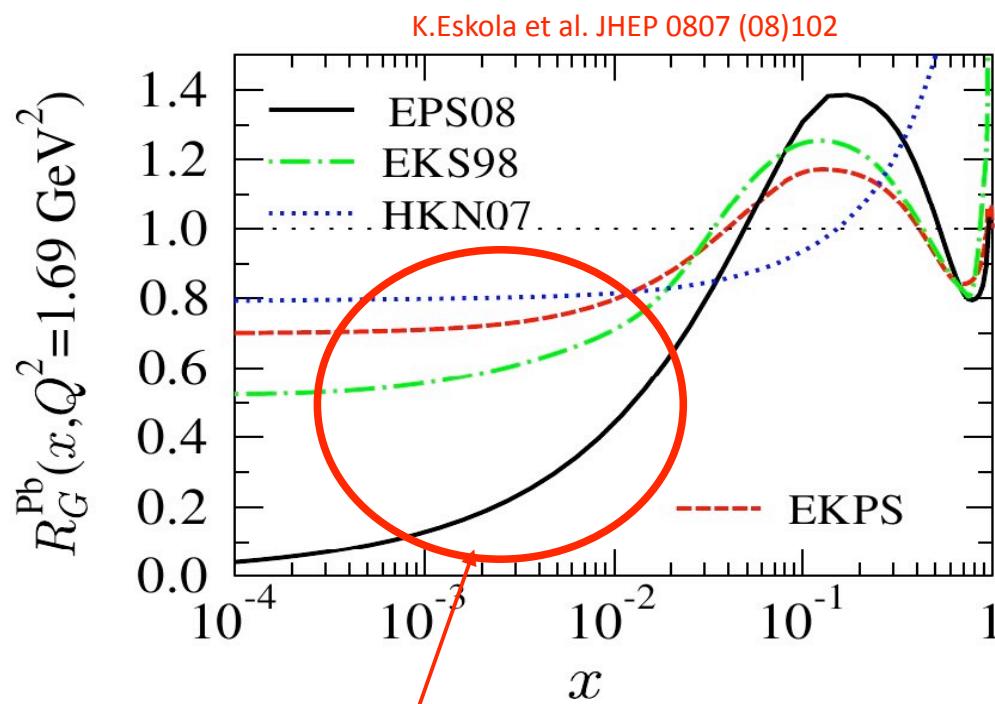

Outline

1. Physics motivations
 1. Nuclear and proton PDFs
 2. Prompt photons
 3. Isolated prompt photons
2. Comparison between Tevatron data and NLO p-QCD predictions
3. Sensitivity of isolated photons spectra to PDFs in p-p at LHC mid-rapidity
 1. Cross-section dependence on PDFs
 2. Theoretical uncertainties
4. Sensitivity of isolated photons spectra to PDFs in p-p at LHC forward-rapidity
 1. Cross-section dependence on PDFs
 2. Theoretical uncertainties

Nuclear PDFs (gluon)

- Current knowledge of low- x gluons:

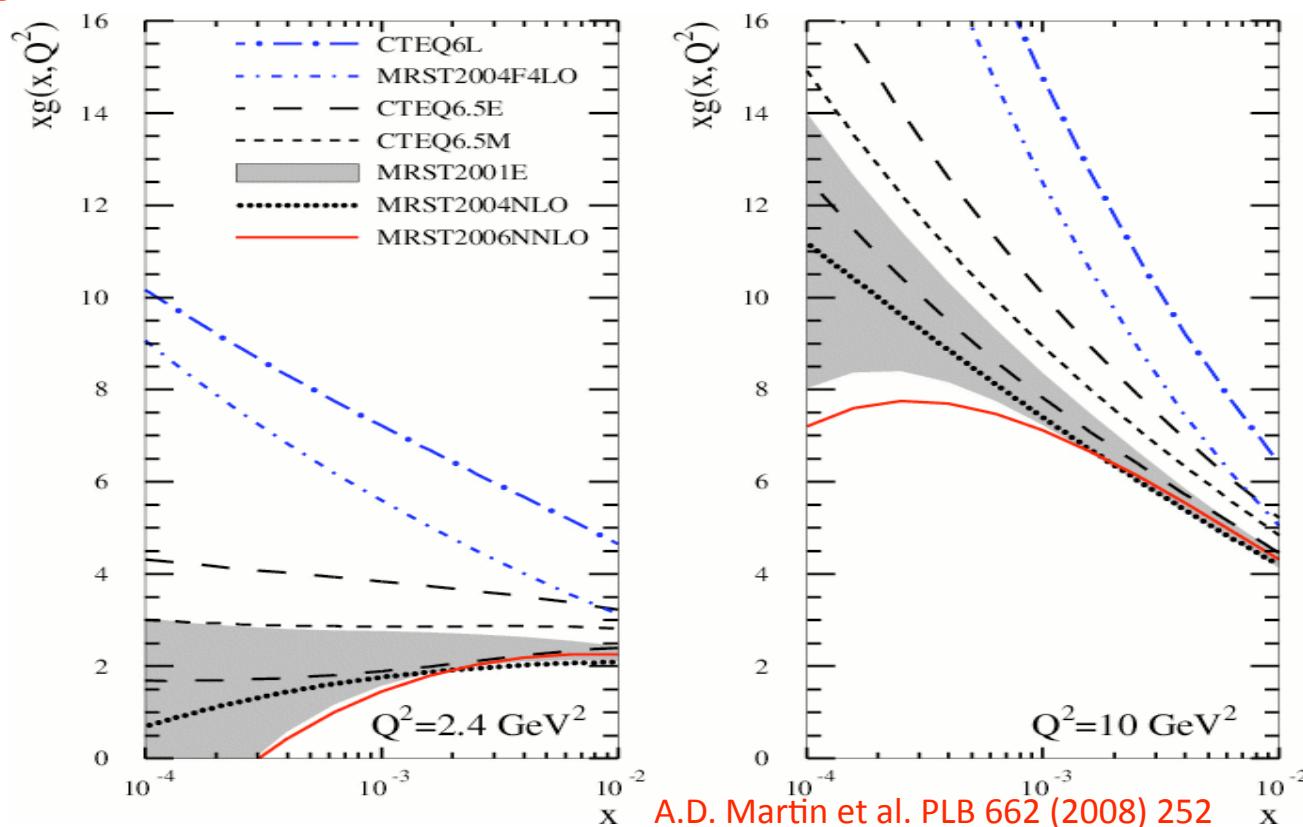

Very large uncertainties below $x \sim 10^{-2}$!

BUT, $xG(x, Q^2)$ of the proton has its own uncertainties still, not shown!

Motivations
Nuclear and proton PDF
Prompt photons
Isolated prompt photons
Tevatron vs NLO p-QCD predictions
Predictions at LHC($y=0$)
X-section PDFs Th. Uncertainties
Predictions at LHC($y=4$)

Proton PDFs (gluon)

- Most of our current knowledge of low- x gluons comes indirectly from e^- proton F_2 “scaling violations”:
- $$\frac{\partial F_2(x, Q^2)}{\partial \ln(Q^2)} \approx \frac{10\alpha_s(Q^2)}{27\pi} x g(x, Q^2)$$
- Large uncertainties below $x \sim 10^{-2}$ at moderate Q^2 :

Predictions at LHC($y=4$)

X-section PDFs Th uncertainties

Prompt photon production in p-p

Prompt photons are produced directly in the hard scattering or from the fragmentation of a parton into a photon

Motivations

X-section PDFs
Th uncertainties

Motivation : the gluon PDF

But since 1998, no photon data is included in the PDF fits.

Compton channel :

- information on $g(x, Q^2)$
- dominate the cross-section :
- ~ from 13 to 150 GeV (Tevatron)
- ~ from 35 GeV (LHC mid-rapidity)

Motivations

Isolated prompt photons

Why ? - To suppress the background of secondary photons coming from the hadron decays (mainly π^0 , η mesons)

- To reduce fragmentation photons & enhance direct

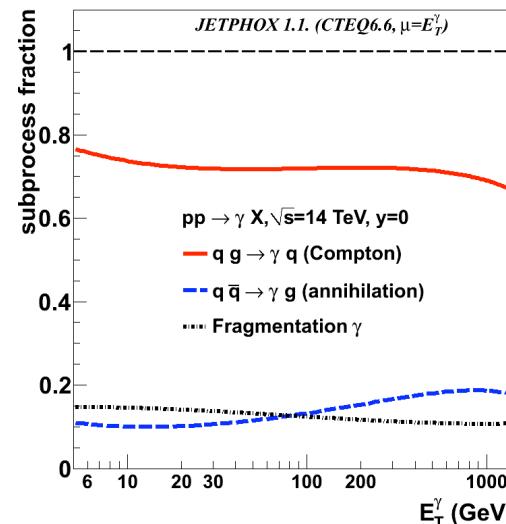

A photon is isolated if the sum of the p_T of the hadrons in a cone of radius $R = \sqrt{(\Delta\eta^2 + \Delta\Phi^2)}$ around γ direction is smaller than a fraction ε of the photon p_T

$$\sum_i p_{T,i} \leq \varepsilon \cdot p_{T,\gamma}$$

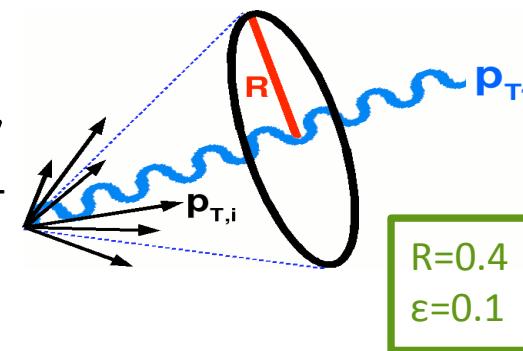

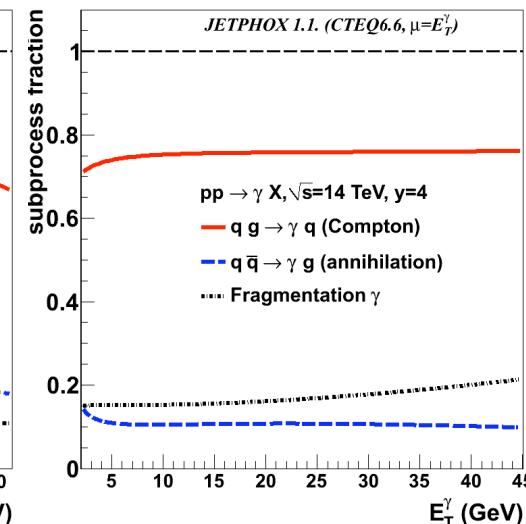

Tevatron mid-rapidity

LHC mid-rapidity

LHC forward-rapidity

Conclusions & Outlook

1. The measurement of isolated prompt photons spectra is SENSITIVE to the gluon PDFs.
2. But the PDFs uncertainties are always smaller than the theoretical scales uncertainties for LHC mid-rapidity or forward-rapidity.
3. We need to reduce scale uncertainty (+/-20%) in the pQCD calculations to be sensitive to PDF variations (+/-15%)

1. Ongoing studies in ALICE show that we can measure isolated gamma in the p_T range $\sim[10-100]$ GeV/c with good stats and syst. uncertainties similar to Tevatron ($\sim 15\%$)
2. Given the larger nuclear PDF uncertainties, it would be interesting to redo those studies for isolated photon in p-A collisions
